CHEMIC ORY
Date 29/3/55.
SCIENCE COLLEGE

INDEX

ABBEY House Museum, Leeds, 66
Abdel-Hak, Dr. T.: Wheat Breeding in the Near East, 253
Abdominal Lymphatic Tissue as a Source of Hyperglycæmic Glycogenolytic Factor (M. R. Raja Rama Rao and Dr. N. N. De), 229
Abell, —. Discovery of an Asteroid, 1132
Abercrombie, M., and Heaysman, Dr. Joan E. M.: Invasiveness of Sarcoma Cells, 697
Aberg, Dr. E.: Weed Control, 1179
Abietaceous Cones from the Wealden of Belgium: Three (K. L. Alvin), review, 900
Ability of Normal and Sickle-Cell Hæmoglobins to form Complexes (C. G. Anderson and S. B. Griffiths), 928
Abnormal Growth: Some Chemical Aspects of (Prof. F. Bergel), 156
Abnormal Growths associated with Wool Follicles in Sheep (M. L. Ryder and L. Auber), 743
Abnormal Properties of Histones from Malignant Cells (Dr. H. J. Cruft, Dr. C. M. Mauritzen and Dr. E. Stedman), 580
Abnormal and Pathological Plant Growth (Brookhaven Symposia in Biology, No. 6), 776
Abood, Dr. L.: Chemistry in relation to the Development of the Nervous System, 457
Aboriginal Rock-paintings in New South Wales (W. H. Kinsela), 343
Aborigines: Social Life and Philosophy of, review by Mrs. Sonia Cole, 623
Abrahams, Dr. S. C.: Appointed to a senior I.C.I. Fellowship in the University of Glasgow, 1039
Abrams, A. J.: Social and Individual Significance of Ageing, 683
Abrams, Mark: Social and Individual Significance of Ageing, 682
Abrams, M. E., and others: Effect of Cervical Sympathectomy on the Onset of Œstrus in Ferrets, 311
Absolute Concentration of Deuterium in Thames River Water: Determination of the (G. Clarke, W. H. Denton and P. Reynolds), 469
Absolute Pressures (Low): Measurement of Small Differential Pressures at (D. I. Gaffee and A. G. Monroe), 756
Absolute Rates of Chlorine Monoxide Reactions: Photolysis of Chlorine Dioxide and (F. J. Lipscomb, Prof. R. G. W. Norrish and Dr. G. Porter), 785
Absorption in Castor Oil, Carbon Disulphide, Benzene and Xylene: Ultrasonic (Prof. A. K. Dutta and K. Samal), 976
Absorption of Ions by Plants (D. Reichenberg and J. F. Sutcliffe), 1047
Absorption by Leaves from Nutrient Sprays (G. N. Thorne), 111
Absorption Spectra of Proteins in the Solid State: Infra-red and Ultra-violet (Elton S. Cook, Cornelius W. Kreke, Edward B. Barnes and Werner Motzel), 1144
Absorption Spectra of Steroids: Infrared (Konrad Dobriner, E. R. Katzenellenbogen and R. Norman Jones), review by Dr. A. E. Martin, 945
Absorption Spectroscopy: Symbols and Terminology used in (P. W. D. Mitchell), 591
Absorption Spectrophotometry (Infra-red): Estimation of Impurities in Liquid Chlorine by (A. W. Pross), 467
Absorption Towers (G. A. Morris and J. Jackson), review by Prof. H. E. Watson, 1072
Académie d'Agriculture de France: Election of Sir John Russell as a foreign member, 20
Acceleration of Flowering in Non-vernalized Chrysanthemums by the Removal of Apical Sections of the Stem (Dr. D. Vince and D. T. Mason), 842; (Dr. W. W. Schwabe), 1022
Accelerators (High-energy)?: What can we Learn with (Prof. E. Fermi), 914
Accuracy of Volumetric Glassware: Design and, 635
Acer saccharum in Ontario: Decay of the Sugar Maple (V. J. Nordin), 343
Acetate: Effect of, on the Fasting Blood-Sugar Level of the Rat (R. J. Garner and R. Roberts), 1194
Acetate-2-^{14}C: Incorporation of, into Human Erythrocyte Stroma as a Function of Storage (Dr. K. I. Altman and Scott N. Swisher), 459
Acetobacter suboxydans: Alternate Pathways of Glycerol Oxidation in (Jens G. Hauge, Tsoo E. King and Prof. Vernon H. Cheldelin), 1104
Acetylation of Isoniazid: Biological (Dr. Willard J. Johnson), 744
Acetylcholine Antagonists: Inability of, to protect Mice against the Toxicity of 'Tensilon' (M. W. Parkes and P. Sacra), 969
Achelis, Elisabeth, and others: Calendar Reform and the Seven-day Week, 488
Acid Sandy Podsols: Micro-fungal Population of (Dr. Ethel I. McLennan and Sophie C. Ducker), 1060
Acid Soil: Tree Growth on, 855
Acid Soils and Forest Trees: The Interactions between (British Association for the Advancement of Science, Sections K (Botany) and K* (Forestry), Symposium on), 855
Acids: The Nucleic, *review* by Dr. Roy Markham, 476
Acids (Fatty): Electrophoretic Movement of Higher, on Filter Paper (Dr. A. John G. Barnett and D. K. Smith), 659
  Occurrence of, with Uneven-numbered Carbon Atoms in Natural Fats (Dr. F. B. Shorland), 603
Acids (Nucleic): The Biochemistry of the (Prof. J. N. Davidson), second edition, *review* by Dr. Roy Markham, 476
Acids (Organic): Paper Chromatography of (Prof. F. Smith and D. Spriestersbach), 466
Acids (Straight-chain Saturated Fatty): A Chromatographic Method for the Estimation of Oleic and Linoleic Acids in the presence of (W. Mary L. Crombie, R. Comber and S. G. Boatman), 181
trans-Acids in Animal Fats: Occurrence of (L. Hartman, Dr. F. B. Shorland and I. R. C. McDonald), 185
Acoustics of the Singing Voice, 716
ACTH from Human Pituitaries: Extraction of (C. L. Hewett, B. Cruickshank and A. R. Currie) 745
Actinide Series (G. T. Seaborg), (Comprehensive Inorganic Chemistry, edited by Prof. M. Cannon Sneed, Prof. J. Lewis Maynard and Prof. Robert C. Brasted, Vol. 1), *review* by Dr. R. Spence, 944
Actinomycetes in Soil: Antibiotic Production by, demonstrated by Morphological Changes induced in *Helminthosporium sativum* (I. L. Stevenson), 598
Actinophage for Potato Scab (F. H. S. Newbould and E. H. Garrard), 997
Action of Squalene upon Carcinogenic Hydrocarbons (Dr. Harry Sobel and Jessie Marmorston), 553
Action of Yeast Polygalacturonase: Composition and (A. L. Demain and H. J. Phaff), 515
Active Principle of the Artichoke: Constitution of Cynarine, the (Luigi Panizzi and Maria Luisa Scarpati), 1062
Activity (Synthetic), of a Single Epithelial Cell of the Lactating Goat Udder (K. C. Richardson and Dr. S. J. Folley), 828
Acton Society Trust: Conference on the Pitfalls in the Collection of Data from Firms, 500
Adams, C. E., and others: Successful Inter-breed Transfer of Ova in Sheep, 890
Adams, G. H., and Calvert, H. R.: Historic Astronomical Books, 1087
Adams, W. N., and others: Infra-Red Spectra of Coals, 1098
Adenosine Triphosphatase (Mitochondrial): Effect of Silver Ions on (J. B. Chappell and G. D. Greville), 930
Adjutantis, G.: An Improved Resolution of Cytoplasmic Proteins of Rat Liver after *n*-Butanol Treatment, 1054
Adjuvant to Atropine in the Therapy of Paraoxon Poisoning: Pentamethonium as an (C. A. de Candole and M. K. McPhail), 552
Adkins, B.: Aircraft Electrical Systems, 1001
Administration of Research: Eighth Annual Conference on the, 1043
Adrenal (Rat): Secretion of Aldosterone and Corticosterone by the (Bertha Singer and M. P. Stack-Dunne), 790
Adrenaline and Noradrenaline: Blood Platelets as Carriers of (Dr. H. Weil-Malherbe and A. D. Bone), 557
Adrenocortical Steroids and their Metabolites: The Determination of (Proceedings of a Conference held by the Society for Endocrinology, edited by P. Eckstein and S. Zuckerman), *review* by Dr. N. R. Lawrie, 52
Adrenocorticotrophic Activity of Melanophore-expanding Hormone Preparations from Beef Pituitary Glands (Dr. B. G. Benfey, Dr. M. Saffran and A. V. Schally), 1106
Adrenocorticotrophic Hormone: Effect of Posterior Pituitary Hormone on the Release of (Shinji Itoh and Akira Arimura), 37
Adrian, Dr. E. D.: Science and Human Nature (Presidential Address to the British Association for the Advancement of Science), 433
  Localization of Function in the Adrenal Cortex, 718
  The Diversity of Scientific Advances (Anniversary Address to the Royal Society), 1032
  Elected president of the Royal Society for 1955, 1174
Adsorption: Stabilization of Free Radicals by—Detection by Paramagnetic Resonance (Dr. D. Bijl, Dr. H. Kainer and A. C. Rose-Innes), 830
Adsorption of Aliphatic Acids on Porous Carbon: Alternation in the (Dr. John L. Morrison and David M. Miller), 1188
Adsorption of Alkyl Xanthate and Dithiophosphate on a Cleavage Face of Galena as revealed by Electron Diffraction (Hitosi Hagihara and Hajime Uchikoshi), 80
Adsorption Columns in the Analysis of Emulsions stabilized with Non-ionic Detergents: Use of (T. Green, R. P. Harker and F. O. Howitt), 659
Adult Education—Why this Apathy? (Dr. Ernest Green), 524
Adult Education in England and Wales: The Organization and Finance of (Ministry of Education), 865
Adult Education in Great Britain, 523
Adult Education in Great Britain—Report of the Ashby Committee, 865
Adult Rat: Metabolism of Elastin in the (H. G. B. Slack), 512
Adventitious-Root Formation by Fungal Pathogen Metabolites as a Possible Mechanism of Disease Resistance (Prof. M. A. Mostafa), 86
Aerobacter aerogenes: Role of High-molecular Weight Components in the Respiratory Activity of Cell-free Extracts of (Dr. A. Tissières), 183
Aeronautical Dynamics: Introduction to (Prof. Manfred Rauscher), *review* by Prof. W. J. Duncan, 1073
Aeronautical Society, Royal: Selection of N. E. Rowe as president-elect, 818
Aeronautics: Basic Dynamics for Students of, *review* by Prof. W. J. Duncan 1073
  English Electric Research Fellowship in (awarded to M. E. Filby), 680
Aeronautics, College of: English Electric Research Fellowship in Aeronautics awarded to M. E. Filby, 680
  Perring Scholarship awarded to G. E. Smith, 680
  Appointment of Prof. J. A. J. Bennett as professor of aerodynamics, 775
Æther Drift Experiment: Proposal for a New (Mrs. H. Littman Furth), 505
Affleck, H.: A Disease Epidemic in Fish, 615
Africa: Research on the Mammals of (Dr. L. Harrison Matthews), 670
Africa (East): Experiments on Artificial Stimulation of Rain in (D. A. Davies), 256
Africa (East) High Commission: Appointment of Miss E. R. Blydenstein as meteorologist, 344
  Annual Report for 1953 of the East African Industrial Research Board, 430

  Appointment of R. D. Brown as veterinary research officer (virologist), 821
  Appointment of M. C. Williams as medical research officer, grade 3, 821
  Annual Report for 1953, 823
Africa (South) The Geology of (Dr. Alex. L. du Toit), edited and prepared for publication by Dr. S. H. Haughton, third edition, *review*, 945
  Research on the Mammals of (J. Meester), 1149
Africa (South-East) : Rituals of Rebellion in (Prof. Max Gluckman), 72
Africa (West and Equatorial) · The Birds of (Dr. David Armitage Bannerman), Vol 1, Struthionidae to Picidae ; Vol. 2, Eurylaemidae to Ploceidae, *review* by Sir Landsborough Thomson, 5
Africa South of the Sahara · Phyto-Sanitary Convention for, 725
African Minerals · Estimates of Age for some (Prof. J. T. Wilson, R. M. Farquhar, P. Gretener, R. D. Russell and H. A. Shillibeer), 1006
African Worlds (edited by Daryll Forde), *review* by Dr. John Middleton, 715
African (East) Industrial Research Board · Annual Report for 1953, 430
African (East) Malaria Unit : Appointment of T. E. Fletcher as scientific officer (chemist), 821
African (South) Cave Deposits . Evidence of Fire in (Dr. Kenneth P. Oakley), 261
African (South) Museum, Cape Town . Report for 1953–54, 776
African (South) Universities · Register of Current Scientific Research at (Council for Scientific and Industrial Research, Pretoria), 429
African (West) Cacao Research Institute, Gold Coast : Appointment of Miss E. M. Holden as biochemist, 821
African (West) Conference : Fifth International (Prof. L. Dudley Stamp), 21
African (West) Fisheries Research Institute, Sierra Leone : Appointment of A. R. Longhurst as scientific officer, 344
African (West) Institute for Oil Palm Research · First Annual Report, 634
  Appointment of E. B. May as agronomist, 821
African (West) Institute for Trypanosomiasis Research, Nigeria Appointment of J. Williamson as research parasitologist, 821
African Territories (British East) Economic Survey of the (A. J. Hunt), 114
Age . Estimates of, for some African Minerals (Prof. J. T. Wilson, R. M. Farquhar, P. Gretener, R. D. Russell and H. A. Shillibeer), 1006
  Measurements of, by the Carbon-14 Technique (Prof. Hl. de Vries and G. W. Barendsen), 1138
  Parental, and Characteristics of the Offspring (New York Academy of Sciences Symposium on), 304
Age of Parent and Character of Offspring (Prof. K. Mather), 304
Ageing : Aspects of (Ciba Foundation Colloquium on), 162
  International Association of Gerontology Conference on, 682
Ageing of Quartz Crystal Vibrators (H. T. Mitchell), 41
Ages : The Child Through the (Exhibition at the Wellcome Historical Medical Museum), 822
Ages of Uraninites by a New Method (Dr. B. Wasserstein), 1004
Agnew, A. D. Q. : Weed Control, 1178
Agricultural Botany, National Institute of : Thirty-third Annual General Meeting of Fellows, 67
  Annual Report for 1953, 429
Agricultural Botany, National Institute of—its Past, Present and Future (Sir John Russell), 446
Agricultural Bureaux, Commonwealth : Oxford System of Decimal Classification for Forestry, 869
Agricultural Economics (Farm Management) · Scholarships in (Ministry of Agriculture of Northern Ireland Awards), 821
Agricultural Physiology at Cambridge, 339
Agricultural Products : Utilization as Food of Fish and (Aberdeen Section and the Food and Agriculture Groups of the Society of Chemical Industry, and the Scottish Branch of the Institute of Biology, Conference on), 209
Agricultural Research : Fundamental Science in, with special reference to the Development of Genetics (Prof. K. Mather), 998
Agricultural Research under Review, 663, 955
Agricultural Research Council . Retirement of Dr. John Hammond as honorary director of the Unit of Animal Reproduction, 339
  Appointment of Frank Rayns as a member, 777
  Appointment of Prof. S. Zuckerman as a member for a further term, 777
Agricultural Society of England, Royal . Offer of a Medal and an Award, 910
Agricultural Statistics : Scholarships in (Ministry of Agriculture of Northern Ireland Award), 821
Agricultural Subjects : Postgraduate Scholarships in (Department of Agriculture for Scotland Awards), 681
Agricultural and Horticultural Research Station, Long Ashton . Annual Report for 1953, 954
Agriculture at Reading, 428
Agriculture : Diamond Jubilee Number, 725
Agriculture—The Industry and the Science (Dr. R. E. Slade), 444
Agriculture : Methods of Land-Clearance for (Agriculture Group of the Society of Chemical Industry Discussion on), 68
Agriculture (Scottish) · Meteorology and (Royal Meteorological Society Symposium on), 493
Agriculture, Association of, and the Burton Manor Residential College for Adult Education · Course on Biology and Geography, 253
Agriculture, Department of, Gold Coast : Appointment of J. Bowden as senior specialist, 821
Agriculture, Ministry of, of Northern Ireland Scholarships in agricultural economics (farm management) awarded to G. L. Morrison and W. Thompson, 821
  Scholarship in agricultural statistics awarded to A. A. Rutherford, 821
Agriculture for Scotland, Department of : Award of Postgraduate Scholarships in Agricultural Subjects, 681
Agriculture and Fisheries, Ministry of · Diseases and Pests on Horticultural Planting Material (P. Aitkenhead and Dr. J. A. Tomlinson), 163
  Books on Agriculture and Horticulture, third edition, 587
Agriculture and Forestry (Canadian) : The Application of Biological Research to (Dr. K. W. Neatby), 766
Agriculture and Horticulture : Books on (Ministry of Agriculture and Fisheries), third edition, 587
Agrobiology (T. D. Lysenko), translated from the fourth Russian edition, *review* by Dr. E. Ashby, 148
Ahlenstiel, Dr. Heinz . Rotgrünblindheit als Erlebnis—Fuhrer durch die Farbwelt fur Rotgrünblinde, *review* by Prof. W. D. Wright, 989
Ahmedabad Textile Industry's Research Association, (Dr. Vikram A. Sarabhai), 578
Ahrens, Dr. L. H. : Shielding Efficiency of Cations, 644
  Distribution of Minor Elements in Rocks, 811
Aids for Sub-normal Vision . A New Development in (J. Lederér), 977
Air at Low Pressure in the Region of 300 Mc./s. : Artificial Increase of Electrical Breakdown Strength of (G. W. E. Stark and G. L. Fougere), 1066
Air, Quartz and Metal Films Cathodoluminescence of (Prof. J. B. Birks and W. A. Little), 82
Air Bubbles : Bursting of, at the Surface of Sea Water (B. J. Mason), 470
Air Temperature : Newly Fallen Snow and (Prof. Mario Bossolasco), 362
Air-saturated Water : Injurious Effect of, on certain Invertebrates (Prof. H. Munro Fox and Angela E. R. Taylor), 312
Aircraft Electrical Systems . Vacation School on (Imperial College of Science and Technology), 67, 1001
Aircraft Noise : Problems of, 119
Aitchison, R. E : A New Circuit for Balancing the Characteristics of Pairs of Valves, 704
Aitken, Ralph A. : Awarded Fellowship by thesis of Heriot-Watt College, Edinburgh, 164
Aitkenhead, P., and Tomlinson, J. A : Diseases and Pests on Horticultural Planting Material, 163
Aizawa, K. . Neutralization of Silkworm Jaundice Virus by Human Serum, 748
Akazawa, Takashi, and others · Increase of Respiratory-rate in Sweet Potato Tissue Infected with Black-Rot, 1060
Akers, Sir Wallace : *Death* of, 864
Alabaster, J. S., and Herbert, D. W. M. · Influence of Carbon Dioxide on the Toxicity of Ammonia, 404
Albright and Wilson, Ltd. · Production of Silicones at Barry, Glamorgan, 1041
Aldehyde : The Ubiquitous, *review* by Dr. J. Idris Jones, 1163
Alderweireldt, F. (Verzele, M., and) : A New Glass Cell for Preparative Counter-Current Distribution, 702
Aldosterone and Corticosterone Secretion of, by the Rat Adrenal (Bertha Singer and M. P. Stack-Dunne), 790
Alembic Club Lecture of the Royal Society of Edinburgh : First (Prof. James Kendall), 864
Alethotrophic Logic, a Posthumous Work (Sir Almroth E. Wright), presented by Giles J. Romanes, *review* by Prof. L. P. Garrod, 621
Alexander, Mrs. F. E. S., and Jackson, R. M. : Examination of Soil Micro-organisms in their Natural Environment, 750
Alföldi, Lewis (Ivánovics, Prof. George, and) : A New Antibacterial Principle—Megacine, 465
Alfonso, Dr. C. : Awarded a Ramsay Memorial Fellowship for 1954–55 for research in chemistry, 112
Alga (Brown): Stimulation of the Discharge of Gametangia from a, by a Change from Light to Darkness (Dr. Lionel Jaffe), 743
Algal Proteins · Similarity of (W. Fowden), 820
Algebraic Geometry (Prof. Solomon Lefschetz), *review* by Dr. L. S. Goddard, 7
Alimentary Tract : Disorders of the, and their Nutritional Effects (Scottish Group of the Nutrition Society Symposium on), 492, 1090
Aliphatic Acids on Porous Carbon . Alternation in the Adsorption of (Dr. John L. Morrison and David M. Miller), 1188
Alkaloid of *Atropa belladonna* : Cuscohygrine, a Normal Constituent (Dr. P. Reinouts van Haga), 833
Alkaloid of *Rauwolfia serpentina* : Mechanism of Hypotensive Action of Reserpine, an (Dr. E. G. McQueen, Dr. A. E. Doyle and Dr. F. H. Smirk), 1015
Alkaloids (*Strychnos*) : Paper Electrophoresis of (Prof. G. B. Marini-Bettòlo and Dr. M. Lederer), 133
Alkoxyglycerols in the Treatment of Leukopenia caused by Irradiation (Astrid Brohult and John Holmberg), 1102
Alkyl Xanthate and Dithiophosphate · Adsorption of, on a Cleavage Face of Galena as revealed by Electron Diffraction (Hitosi Hagihara and Hajime Uchikoshi), 80
Allan, Dr. D. A. : Elected president of the Royal Scottish Geographical Society, 821
Allan, D. L. : Inelastic Scattering of 14-MeV. Neutrons by Lithium-7, 267
Allard, Dr. F. W. : Appointed to a Research Fellowship in genetics at the University of Birmingham, 1132
Allen, Dr. Clifford . The Way of Sex, *review*, 763
Allen, D. N. de G. . Relaxation Methods, *review* by Prof. G. Temple, 714
Allen, Dr. H. P. : Weed Control, 1179
Allen, Prof. H. Stanley *Obituary* by Dr. D. Jack, 108
Allen, Dr. M. B., and others · Photosynthesis by Isolated Chloroplasts, 394
Allgén, Dr. Lars-Goran . Dielectric Increment of Sodium Alginate as a Function of Polyion and Counter-Ion Concentration, 1155
Allopolyploidy in the Melaniid Snails (Joseph Jacob), 1061
Alloy (Titanium–Chromium) : Transformation in a (Dr. H. M. Otte), 506
Alloy Junction Type of Transistor, 121
Allsopp, Dr. A. · Plant Cultivation in Saline and Brackish Water, 782
α-Particle Bombardment . Effect of, on Creep in Cadmium Single Crystals (M. J. Makin), 752
Alternate Pathways of Glycerol Oxidation in *Acetobacter suboxydans* (Jens G. Hauge, Tsoo E. King and Prof. Vernon H. Cheldelin), 1104
Alternation in the Adsorption of Aliphatic Acids on Porous Carbon (Dr. John L. Morrison and David M. Miller), 1188
Altman, Dr. K. I., and Swisher, Scott N. : Incorporation of Acetate-2-^{14}C into Human Erythrocyte Stroma as a Function of Storage, 459
Altman, Dr. K. I., and others : Electrophoresis of Human Red-Cell Stroma, 1146
Altmann, Dr. S. L. · The Electronic Band Structure of Solids, 950
Alton, H. G. (Bell, Dr. W. N., and) : A Brain Extract as a Substitute for Platelet Suspensions in the Thromboplastin Generation Test, 880
Alumina Sample Holders for Differential Thermal Analysis : Comparative Performance of Nickel and Porous (T. L. Webb), 686 ; (Dr. Robert C. Mackenzie), 688

Aluminium: Chemical Form of Phosphorus-32 produced in, by Bombardment with Nitrogen (Dr. G. A. Chackett and Dr. K. F. Chackett), 232
  Research and Development in—Banbury Laboratories of Aluminium Laboratories, Ltd., 254
Aluminium (High-Purity): Sub-Grain Boundary Corrosion in (M. Metzger and J. Intrater), 547
Aluminium of Extreme Purity: Preparation of, by the 'Zone Fusion' Process (Prof. Georges Chaudron), 923
Aluminium Development Association: Research Report No. 22, Electrical Potential Analyser for the Solution of the Problem of the Determination of the Torsion Constants for Bulbs and Fillets (P. J. Palmer), 253
Aluminium Laboratories, Ltd.: Research and Development in Aluminium —Banbury Laboratories of, 254
Alumni Cantabrigienses (compiled by Dr. J. A. Venn), Part 2, From 1752 to 1900, Vol. 6, Square—Zupitza, *review* by Prof. F. J. M. Stratton, 896
Alvarenga Prize for 1954 of the College of Physicians of Philadelphia awarded to Dr. DeWitt Stetten, jun., 344
Alvin, K. L.: Three Abietaceous Cones from the Wealden of Belgium, *review*, 900
Amaldi, Prof. E.: Appointed deputy director-general of the European Organization for Nuclear Research, 774; work of, 774
Amateur Botanist in 1954 (J. E. Lousley), 70
Amateur Geologist: The Pleistocene Period and Work for the (H. E. P. Spencer), 70
Ambergris: A Great Haul of (Robert Clarke), 155
America (Latin): Marine Biology in, 1002
  Scientific Institutions and Scientists in, 1, Costa Rica, El Salvador, Guatemala, Honduras, Nicaragua and Panama (Unesco Science Co-operation Office for Latin America), 430
American Academy of Arts and Sciences: Rumford Bicentennial issue of the *Proceedings* of the, 861
  Prize for outstanding work on some aspect of the alleviation or cure of diseases affecting the human reproductive organs, in particular those of men, 1132
American Association for the Advancement of Science: One hundred and twenty-first Meeting, 1039
American Association for the Advancement of Science (Pacific Division): Presidential Address (Prof. A. H. Sturtevant), 960
American Association of Physics Teachers: Annual Meeting, 914
  Oersted Medal for 1953 presented to Prof. C. N. Wall, 914
  Honorary membership conferred on D. Bronk, 915
  Special citations for noteworthy service voted to T. D. Cope, P. Kirkpatrick, C. J. Overbeck and H. H. Trytten, 915
  Election of Officers for 1954, 915
American Chemical Society (Division of Industrial and Engineering Chemistry): Symposium on Pulsatory and Vibrational Phenomena, 636
American Democracy: Government and Science, their Dynamic Relation in (Don K. Price), *review* by R. Brightman, 475
American Discoveries in Polynesia: Explorers of the Pacific—European and (Te Rangi Hiroa) (Peter H. Buck), *review* by J. N. L. Baker, 287
American Documentation Institute: Scroll of Appreciation presented to Dr. Atherton Seidell, 998
American Geographical Society: Charles P. Daly Medal awarded to Dr. J. K. Wright, 340
American Industry: Scientific Research and Development in (Bulletin No. 1148 of the Bureau of Labor Statistics, United States Department of Labor), 26
American Institute of Electrical Engineers, and others: Fourth Annual Eastern Joint Computer Conference and Exhibition (Design and Application of Small Digital Computers), 432, 681
American Petroleum Institute Project 44: Selected Values of Physical and Thermodynamic Properties of Hydrocarbons and related Compounds (Prof. Frederick D. Rossini, Prof. Kenneth S. Pitzer, Raymond L. Arnett, Rita M. Braun and Prof. George C. Pimentel), *review* by H. B. Milner, 54
American Philosophical Society: Year Book for 1953, 74
  Memoirs of the, Vol. 35, Thomas Jefferson's Farm Book, with Commentary and Relevant Extracts from other Writings (edited by Edwin Morris Betts), *review* by Sir John Russell, 415
  Memoirs of the, Vol. 34, Michael Servetus, a Translation of his Geographical, Medical and Astrological Writings, with Introductions and Notes (Dr. Charles Donald O'Malley), *review* by Dr. Douglas Guthrie, 941
American Physical Society: Annual Meeting, 914
  Retiring Presidential Address (Prof. E. Fermi), 914
  Richtmyer Memorial Lecture (Prof. J. A. Wheeler), 914
  O. E. Buckley Solid-State Physics Prize presented to Dr. J. Bardeen, 914
  Election of Officers for 1954, 914
American Science Writing, *review* by T. H. Hawkins, 240
American Society of Heating and Ventilating Engineers (New York Academy of Sciences and the): Conference on Odour, 303
American Society of Plant Taxonomists and the Botanical Society of America: Papers of a Symposium on Plant Genera, 71
American (East) Species of Crabs in European Waters: Occurrence of Two (Torben Wolff), 188
Amino-acid: Detoxification of Diphtheria Toxin with Formaldehyde mixed with an (Carola Neumuller), 405
Amino-acid derived from Dates: Excretion in Human Urine of an Unknown (Stanley Gartler and Prof. Th. Dobzhansky), 553
Amino-acid in the Peel of Apple Fruits: A New (Dr. A. C. Hulme), 1055
Amino-Acid Content of Plants (K. Mansford and Dr. R. Raper), 314
D-Amino-acid Oxidase: Inhibition of (Eva Helmann-Hollaender and Dr. N. Lichtenstein), 559
Amino-acids: Liberation of, by Plant Roots in relation to Desiccation (H. Katznelson, J. W. Rouatt and T. M. B. Payne), 1110
  A Paper Chromatographic Method for the Quantitative Estimation of (Dr. Anthony L. Levy), 126
Amino-acids (Guanidino): Ion-Exchange Chromatography of, from Synthetically Modified Gelatin (J. E. Eastoe and A. W. Kenchington), 966
Amino-Acids on Paper Chromatograms: A New Method for the Colorimetric Estimation of (F. A. Isherwood and D. H. Cruickshank), 123
Amino acids of Silk Fibroin: Basic (M. C. Corfield, F. O. Howitt and A. Robson), 603
α-, β- and ω-Amino acids with Sanger's Reagent: Polymerization Reactions occurring during Dinitrophenylation of (D. Heikens, Dr. P. H. Hermans and P. F. van Velden), 1187
Aminofluorescein Isomers: A Chromatographic Separation of the (Dr. J. De Repentigny and Dr. A. T. James), 927
Ammonia: Influence of Carbon Dioxide on the Toxicity of (J. S. Alabaster and D. W. M. Herbert), 404
Amoroso, Prof. E. C.: Comparative Endocrinology of Vertebrates, 543
Amphibian Eggs: Influence of Ribonuclease on the Division of (L. Ledoux, J. Le Clerc and F. Vanderhaeghe), 793
Ampullar Secretion (Equine): Ergothioneine in the (Prof. E. Leone), 404
Anacardic Acid from Indian Cashew-nut Shell Liquid: Olefinic Nature of (V. J. Paul and Prof. Lourdu M. Yeddanapalli), 604
Anacyclus pyrethrum DC.: Isolation and Structure of an *N-iso*Butyldiendiynamide from Pellitory (Dr. L. Crombie), 832
Anæmia (Hæmolytic), produced Experimentally in the Guinea Pig by *T*-transformation of the Erythrocytes *in vivo* with Purified Concentrated Enzyme (P. Ejby-Poulsen), 929
Anæsthetic Potency and Penetration of Monomolecular Layers of Nerve Lipoids: Local (Dr. J. C. Skou), 318
Analogies of Pox Viruses and Bacteria: Structural (Dr. D. Peters and W. Stoeckenius), 224
Analyser: Electrical Potential, for the Solution of the Problem of the Determination of the Torsion Constants for Bulbs and Fillets (P. J. Palmer), 253
Analyses of Marine Organisms, *review* by Dr. L. H. N. Cooper, 608
Analysing Creep Curves: A Graphical Method of (A. J. Elleman), 138
Analysis: Organic Chemistry and (Dr. Cecil L. Wilson), 591
  Qualitative, of Organic Compounds by Mass Spectrometry (J. H. Beynon), 735
  Salicyloylhydrazide, a Reagent of Wide Use in Organic and Histochemical (Dr. B. Camber), 1107
Analysis (Inorganic): Chromatographic Methods of (Dr. F. H. Pollard and Dr. J. F. W. McOmie), *review* by E. Q. Laws, 1119
Analysis (Numerical): Principles of (Alston S. Householder), *review* by Dr. L. S. Goddard, 624
Analysis by Chromatography and Ion Exchange, *review* by E. Q. Laws, 1119
Analysis of Emulsions stabilized with Non-ionic Detergents: Use of Adsorption Columns in the (T. Green, R. P. Harker and F. O. Howitt), 659
Analysis of Industrial Solvents: Chemical (Dr. Morris B. Jacobs and Dr. Leopold Scheflan), *review* by C. Whalley, 197
Analysis of Milk in Deficiency Diseases and Intoxications of Cattle (Dr. W. T. Binnerts and Prof. E. Brouwer), 974
Analysis of Mixtures: Quantitative Infra-Red (I. R. C. McDonald), 703
Analysis of Unordered Tetrads Segregating for a Lethal or other Epistatic Factor (Dr. H. L. K. Whitehouse), 463
Analysis by X-Ray Emission Spectrography: Trace (Heinz G. Pfeiffer and Paul D. Zemany), 397
Analytical Chemistry: Ion Exchanges in (Prof. Olof Samuelson), *review* by E. Q. Laws, 1119
Analytical Chemistry, Society for (Biological Methods Group): Symposium on the Biological Evaluation of Water and Effluents, 1042
Andersen, S.: Weed Control, 1179
Anderson, Prof. Arthur K.: Essentials of Physiological Chemistry, fourth edition, *review* by Prof. J. N. Davidson, 764
Anderson, C. G., and Griffiths, S. B.: Ability of Normal and Sickle-Cell Hæmoglobins to form Complexes, 928
Anderson, J. R.: Awarded a Ramsay Memorial Fellowship for 1954–55 for research in chemistry, 112
Anderson, J. R., and others: Electrophoresis of Human Red-Cell Stroma, 1146
Anderson, Prof. T. F.: Specimen Techniques in Electron Microscopy, 825
Anderson, W., and others: The Radon Content of the Atmosphere, 424
Andrade, Prof. E. N. da C.: The Stability of the Sun, *review*, 420
Andre, Dr. A. (Moureau, Prof. P., and): Blood Groups of Human Blood Platelets, 88
Andreas, Dr. C. H.: The Species Concept in relation to the British Flora, 246
Andrewes, Dr. C. H.: Myxomatosis in Britain, 529
Andromeda Nebula: Radio Emission from the (J. E. Baldwin), 320
Andrus, Dr. Ruth: Social and Individual Significance of Ageing, 684
Anet, E. F. L. J., and Reynolds, T. M.: Isolation of Mucic Acid from Fruits, 930
Angle of Contact of Mercury against a Moving Tungsten Wire (A. H. Cook and N. W. B. Stone), 366
Angwantibo: Extension of Range of the (D. R. Rosevear), 190
Anhydrides (N-Carboxy-α-Amino-Acid): New Observations on the Chemistry of (D. G. H. Ballard, Dr. C. H. Bamford and Dr. F. J. Weymouth), 173
Anhydrous Trifluoroacetic Acid as a Solvent for Proteins (Joseph J. Katz), 509
Animal (Test): The Rat as a, in evaluating Artificial Human Milk for Infants (Prof. Paavo Roine, Helge Gyllenberg, Marjatta Rossander and Ritva Vuokila), 519
Animal Behaviour (British Association for the Advancement of Science, Sections D (Zoology) and J (Psychology), Discussion on), 857
Animal Fats: Occurrence of *trans*-Acids in (L. Hartman, Dr. F. B. Shorland and I. R. C. McDonald), 185
Animal Populations and Forestry (British Association for the Advancement of Science, Sections D (Zoology) and K* (Forestry), Symposium on), 813
Animal Welfare, Universities Federation for: Summer School at Knuston Hall, 67
Animal Welfare, Universities Federation for (In association with the Animal Welfare Institute of New York): Appointment of Dr. W. M. S. Russell as research fellow to study humane vivisection, 488
Animal Welfare Institute of New York (Universities Federation for Animal Welfare, in association with the): Appointment of Dr. W. M. S. Russell as research fellow to study humane vivisection, 488
Animal Zones of the North Kent Coast (G. E. Newell), 69

Animal and Plant Cells : The Cultivation of (Philip R. White), *review* by Dr. Honor B. Fell, 809
Animals : The Numbers of Man and (Institute of Biology Symposium on), 298, 815
Animals and Humanity : Science, (W. Lane-Petter), 532
Animaux : Les groupes sanguins chez les (Dr. R. Dujarric de la Rivière et Dr. A. Eyquem), *review* by Dr. A. E. Mourant, 898
Anions : Interaction between Metal Ions through (Ryutaro Tsuchida and Dr. Shoichiro Yamada), 1064
Annals of Library Science, Vol. 1, No. 1, 634
Annear, D. I. : Preservation of Bacteria, 359
Annual Review of Nuclear Science (edited by James G. Beckerley), Vol. 3 (1953), *review* by Dr. E. Bretscher, 1162
Annual Review of Plant Physiology (edited by Daniel I. Arnon and Leonard Machlis), Vol. 5, *review* by Prof. Walter Stiles, 1074
Anodonta cygnea : Properties of the Non-Calcareous Material in the Shell of (G. E. Beedham), 750
Anomalies in Osmotic Pressure Measurements (Dr. L. J. Wood and G. Phillips), 801
Anopheline Mosquitoes in Nature : Estimation of the Survival-Rate of (G. Davidson), 792
Ansell, R. H. : Appointed veterinary research officer, Kenya, 864
Anstee, J. R., and others : Barbiturate Antagonism, 402
Antagglutin (Male Sperm) : A Constituent of, related to Vitamin E (Prof. P. E. Lindahl and J. E. Kihlstrom), 600
Antagonism : Barbiturate (Prof. F. H. Shaw, Shirley E. Simon, N. Cass; A. Shulman, J. R. Anstee and Eva R. Nelson), 402
Antagonism by *Serratia marcescens* : Bacterial (Alan Seaman, Dr. Malcolm Woodbine and Anna Kolasiewicz), 406
Antagonist Inhibition as the Earliest Sign of a Sensory-Motor Reaction (H.-J. Hufschmidt and Tamara Hufschmidt), 607
Antagonists (Acetylcholine) : Inability of, to protect Mice against the Toxicity of 'Tensilon' (M. W. Parkes and P. Sacra), 969
Antagonists (Folinic Acid) : Some 2 : 4-Diaminopteridines as (Dr. H. O. J. Collier and Margaret Phillips), 180
Anthropology : Yale University Publications in, No. 49, Excavations at Wari, Ayacucho, Peru (Wendell C. Bennett), *review* by Dr. G. H. S. Bushnell, 287 ; No. 50, On the Excavation of a Shell Mound at Palo Seco, Trinidad (J. A. Bullbrook), *review* by Dr. G. H. S. Bushnell, 287
  Social, at Cambridge since 1900 (Prof. M. Fortes), 72
Anthropology (Social) : Studies in (R. F. Fortune), 72
Antibacterial Principle : A New—Megacine (Prof. George Ivánovics and Lewis Alföldi), 465
Antibiotic : Primycin, a New (Prof. T. Vályi-Nagy, J. Uri and I. Szilágyi), 1105
Antibiotic of *Psalliota xanthoderma* : Psalliotin, the (Nancy Atkinson), 598
Antibiotic Activity : Gramicidin S—Relationship of Cyclic Structure to (Bernard F. Erlanger and Louise Goode), 840
Antibiotic Production by Actinomycetes in Soil demonstrated by Morphological Changes induced in *Helminthosporium sativum* (L. L. Stevenson), 598
Antibiotics : Effects of, on Carbon Dioxide Production in Soil (T. Vincents Nissen), 226
Antibiotics (Antifungal) : Classification of the from *Bacillus subtilis* (N. Sharon, A. Pinsky, R. Turner-Graff, J. Babad and A. P. Cercós), 1190
Antifungal Antibiotics from *Bacillus subtilis* : Classification of the (N. Sharon, A. Pinsky, R. Turner-Graff, J. Babad and A. P. Cercós), 1190
Antigens (Embryonic) : Localization of, by Antisera labelled with Fluorescent Dyes (Mrs. R. M. Clayton), 1059
Antioestrogenic Potencies of various Progesterone Derivatives with Oxidation at C_{11} (Dr. Elvira Mardones, Dr. Rigoberto Iglesias and Prof. A. Lipschutz), 839
Antiproton : Evidence for the, 160
Antisera labelled with Fluorescent Dyes : Localization of Embryonic Antigens by (Mrs. R. M. Clayton), 1059
Antispasmodics : New Synthetic (Dr. J. Cymerman-Craig, K. V. Martin, P. C. Wailes, Prof. R. H. Thorp, R. Ladd and G. Thorburn), 231
Antwerp 'Zoo' Bulletins, 539
Anwar, A. (Hafez, Dr. E. S. E., and) : Normal Hæmatological Values in the Buffalo, 611
Apatite Crystals in Bone : Orientation of (Mrs. Sheena M. Clark and Dr. John Iball), 399
Apex (Fern) : Effect of Deep and Shallow Incisions on Organogenesis at the (Prof. C. W. Wardlaw and E. G. Cutter), 734
Apical Sections of the Stem : Acceleration of Flowering in Non-vernalized Chrysanthemums by the Removal of (Dr. D. Vince and D. T. Mason), 842 ; (Dr. W. W. Schwabe), 1022
Apparent Induced Enzyme Formation due to Co-enzyme Deficiency (A. A. Hakim and Prof. Frank C. Happold), 358
Apple Fruits : A New Amino-acid in the Peel of (Dr. A. C. Hulme), 1055
Appleton, Sir Edward : The Upper Atmosphere, 334
  The Physics of the Ionosphere, 867
  Thermionic Devices from the Development of the Triode up to 1939, 1077
Application of Results of Research (compiled and edited by Vera Connell, in collaboration with the British Commonwealth Scientific Offices, London), 805
Application of Small Digital Computers : Design and (American Institute of Electrical Engineers, the Institute of Radio Engineers and the Association of Computing Machinery fourth Annual Eastern Joint Computer Conference and Exhibition), 432, 681
Applications of Chromatography : Principles and, *review*, 5
Applied Research in Europe : Organization of (Organization for European Economic Co-operation), 778
Applied Research in Technical Colleges (London and Home Counties Regional Advisory Council for Higher Technological Education, Publication No. 18), 913
Apricot Fruit : Ketose Oligosaccharides in the (A. S. F. Ash and T. M. Reynolds), 602
Aquatic Herbicide : Copper Sulphate as an (Hamid Sharif El Din and K. Wilson Jones), 187
Aqueous Buffers : Solubility and Electrophoretic Behaviour of Steroid-Detergent Mixtures in (Dr. Otto J. Schmid and Dr. Klaus D. Voigt), 129
Aramaki, Yoshitomo, and others : Atoxopyrimidine Action of Vitamins of the B_6 Group, 275
Arata, G. U. : Leonardo, architetto e urbanista, *review*, 152
Arber, Dr. Agnes : Dukinfield Henry Scott (1854–1934), 992
Archæologists (Czechoslovak) : Ninth Working Conference of (Czechoslovak Academy of Sciences), 861
Archæology : Colonial (Sir Mortimer Wheeler), 442
Archæology (Monastic) : The Present State of, in Kent (F. C. Elliston Erwood), 69
Archæology at Athens, British School of : Annual Report for the Session 1952–53, 633
Archæology in Greece, 1952–1953 (J. M. Cook and J. Boardman), 633
Archæology in the Laboratory (Council for British Archæology Conference on), 956
Archæology of Northern France : Pleistocene Geology and, *review* by M. C. Burkitt, 987
Archæology (British), Council for : Formation of a Scientific Research Committee, 677
  Conference on Archæology in the Laboratory, 956
Archaeopteryx and Evolution (Sir Gavin de Beer), 439
Archard, G. D. : Awarded a Bowen Prize for 1953 by the Institute of Physics, 208
Archer, M. S., and others : Magnetic Susceptibility of Vanadium Dioxide, 754
Architecture : Scholarships in Science, Technology and (Massachusetts Institute of Technology), 1040
Archives of Machine Design (Polish Academy of Science), 997
Archiwum Budowy Maszyn (Polska Akademia Nauk), 997
Arcs : The Positive Column of High- and Low-Current (L. A. King), 1008
Arid Zone Programme, Unesco : Reviews of Research on Problems of Utilization of Saline Water, 782
Arid Zone Research : Seventh Session of the Advisory Committee on (Unesco), 115
Arimura, Akira (Itoh, Shinji, and) : Effect of Posterior Pituitary Hormone on the Release of Adrenocorticotrophic Hormone, 37
Arisz, Prof. W. H. : Transport of Chloride in the 'Symplasm' of *Vallisneria* Leaves, 223
Armagh Observatory : Contributions from the, No. 9, A Climatological and Astronomical Interpretation of the Ice Ages and of the Past Variations of Terrestrial Climate (Dr. E. J. Öpik), 172
Armed Services (British) : Technical Graduates in the, 1131
Armstrong, Desirée, and others : Development of Pain-producing Substance in Human Plasma, 791
Armstrong, D. G., and others : Digestibility of a Sample of Pasture Grass by Calves, 1182
Armstrong, R. H., and others : Digestibility of a Sample of Pasture Grass by Calves, 1182
Arnett, Raymond L., and others : Selected Values of Physical and Thermodynamic Properties of Hydrocarbons and related Compounds—Comprising the Tables of the American Petroleum Institute Project 44, *review* by H. B. Milner, 54
Arnon, Prof. Daniel I., and Machlis, Leonard (edited by) : Annual Review of Plant Physiology, Vol. 5, *review* by Prof. Walter Stiles, 1074
Arnon, Prof. Daniel I., and others : Photosynthesis by Isolated Chloroplasts, 394
Arnon, Prof. Daniel I. (Loneragan, Dr. J. F., and) : Molybdenum in the Growth and Metabolism of *Chlorella*, 459
Art of the Megalith Builders (Dr. Glyn Daniels), 69
Artefact on Chromatograms of the Keto-acid 2,4-Dinitrophenylhydrazones : Identification of an (G. H. N. Towers and D. C. Mortimer), 1189
Artichoke : Constitution of Cynarine, the Active Principle of the (Luigi Panizzi and Maria Luisa Scarpati), 1062
Artificial Human Milk for Infants : The Rat as a Test Animal in evaluating (Prof. Paavo Roine, Helge Gyllenberg, Marjatta Rossander and Ritva Vuokila), 519
Artificial Increase of Electrical Breakdown Strength of Air at Low Pressure in the Region of 300 Mc./s (G. W. E. Stark and G. L. Fougere), 1066
Artificial Stimulation of Rain in East Africa : Experiments on (D. A. Davies), 256
Artificial and Natural Coloration of Diamonds (R. A. Dugdale), 120
Artificially Induced Ovulation and Mating : Conception in Prepuberal Mice following (Meredith N. Runner and Allen Gates), 222
Arts, Royal Society of : R. B. Bennett Empire Prize for 1954 awarded to Dr. C. J. Mackenzie, 298
Arts and Manufactures : Organic Chemistry in the, *review* by H. M. Langton, 419
Aryl Iodoacetates : Histochemical Adaptation of (Dr. John P. Lhotka), 882
Arylsulphates (Biosynthetic) : Isolation and Characterization of (Dr. K. S. Dodgson, F. A. Rose and Dr. B. Spencer), 599
Asay, Ivan (Astin, Dr. A. V., and) : Research Administration Conference, 1043
Ascorbic Acid : Inactivation of the Chromatophore-expanding Activity of Pituitary Extracts by (Dr. Marg. Holzbauer and Dr. R. Rigler), 877
Ascorbic Acid in the presence of Sulphydryl Compounds : Use of *p*-Chloromercuribenzoic Acid in the Determination of (J. A. Owen, B. Iggo and D. B. Horn), 701
l-Ascorbic Acid : Biosynthesis of (N. C. Ganguli, S. C. Roy and Prof. B. C. Guha), 511
Ash : Determination of the Origin of Opium by means of the Composition of the (J. C. Bartlet and C. G. Farmilo), 407
Ash, A. S. F., and Reynolds, T. M. : Ketose Oligosaccharides in the Apricot Fruit, 602
Ashby, Dr. A. : Appointed a member of the Advisory Council for Scientific and Industrial Research, 540
Ashby, Dr. E. : Lysenko in Perspective, *review*, 148
  Experimental Plant Morphology, *review*, 285
Ashby, E., and Wangermann, E. : Parental Age and Characteristics of the Offspring, 304
Ashby, Dr. Maurice : Science in Everyday Life, *review*, 331
Ashby Committee : Adult Education in Great Britain—Report of the, 865
Ashkin, Dr. J. : Nuclear and Meson Physics, 531
Ashton, Sir Leigh : The Functions of Museums (Presidential Address to the Museums Association), 333
  Re-elected president of the Museums Association, 334

Asia (South): Union Catalogue of Learned Periodical Publications in (Indian Library Association), Vol. I, 342
Aslib (Northern Branch): One-day Conference, 821
Aspects of Biochemistry: Dynamic (Prof. Ernest Baldwin), second edition, *review* by Prof. J. N. Davidson, 764
Asperen, Dr. K. van, and Esch, Ida van: A Simple Microtitration Method for the Determination of Calcium and Magnesium in the Hæmolymph of Insects, 927
Aspergillus niger: Inhibition of the 'Condensing Enzyme' of, by Magnesium (C. V. Ramakrishnan and S. M. Martin), 230
Aspinall, K. W.: Appointed deputy director of veterinary services, Nyasaland, 864
Asprey, G. F., and Robbins, R. G.: The Vegetation of Jamaica, 66
Assay of Penicillinase: Iodometric (C. J. Perret), 1012
Assay of Tritium-labelled Substances—a 'Combustion Bomb' Method of Preparation of Gas for Counting (P. R. Payne and J. Done), 27
Assessment of Plant Diseases: Forecasting and (Association of Applied Biologists Symposium on), 769
Assignments of Unsaturation in the Region 900–1,000 cm.$^{-1}$: Infra-Red (Dr. D. Chapman and R. J. Taylor), 1011
Associazione Genetica Italiana: Formation of an, 910
Assortment of Proteins: An, *review* by N. W. Pirie, 762
Asteroid: Discovery of an (—, Abell), 1132
Astin, Dr. A. V., and Asay, Ivan: Research Administration Conference, 1043
Astoin, N., and Vodar, B.: Atomic Line Spectra, 730
Astronomer Royal: Report to the Board of Visitors of the Royal Greenwich Observatory, 494
Astronomical Interpretation of the Ice Ages and of the Past Variations of Terrestrial Climate: A Climatological and (Dr. E. J. Öpik), 172
Astronomical Society, Royal: New General Catalogue of Nebulæ and Clusters of Stars (1888), Index Catalogue (1895), Second Index Catalogue (1908), 635
  George Darwin Lecture (the late Dr. Edwin Hubble), 1046
Astronomy: Books on, published between the fifteenth and the middle of the nineteenth centuries (Science Museum, London, Exhibition), 298, 1087
Atkinson, F. S.: Appointed to the chair of mining in the University of Sheffield, 250; work of, 250
Atkinson, Nancy: Psalliotin, the Antibiotic of *Psalliota xanthoderma*, 598
Atkinson, R. J. C.: A National Index of Archæological Collections, 334
Atlantic (North): Wave Conditions in the, 1953–54 (J. Darbyshire), 827
Atmosphere: The Radon Content of the (W. Anderson, Prof. W. V. Mayneord and R. C. Turner), 424
  The Upper (Royal Meteorological Society Symposium on), 334, *erratum*, 492
Atom: A New Periodic Table of the Elements based on the Structure of the (Dr. S. I. Tomkeieff), *review* by Prof. F. A. Paneth, 420
Atomic Bomb: Fire and the (D. I. Lawson), 586
Atomic Energy—How it all Began (Prof. O. R. Frisch), 431
Atomic Energy: Development of, in Britain, 473
  The Early Developments of, 431
  Peaceful Uses of, 67
  United States Unclassified Information on, 341
Atomic Energy for Peaceful Purposes, 724
Atomic Energy Agency: British Participation in an International, 1038
Atomic Energy Authority: United Kingdom, 18
  Appointment of members, 64
  Heavy-Water Reactor (Dimple) at Harwell, 251
  Appointment of W. R. J. Cook as deputy director of the Atomic Weapons Research Establishment, Aldermaston, 344
  Appointment of Eric H. Underwood as director of public relations, 1172
  Appointment of Stanley White as press officer, 1172
Atomic Energy Commission, Australian: Appointment of Prof. C. N. Watson-Munro as chief of research and development, 1085
Atomic Energy Commission, United States: Stanford Research Institute, California, named as a depository of unclassified information on atomic energy, 341
Atomic Energy Research Establishment, Harwell: Conference on Isotope Techniques, 67
  Ninth Electronics Course, 298
  Second Radioisotope Conference, 453
  Special Course at the Isotope School on Autoradiographic Techniques, 589
  Opening of a Reactor School at Harwell, 635
  Courses on the Techniques of Using and Handling Radioactive Materials, 1172
Atomic Energy Society, European: Establishment of a, 251
Atomic Line Spectra (Swedish National Committee for Physics, Rydberg Centennial Conference on), 729
Atomic Theory (Dalton's): Seventeenth-Century Chemistry, the Phlogiston Theory and (Prof. J. R. Partington), 291
Atomic Weapons Research Establishment, Aldermaston: Appointment of W. R. J. Cook as deputy director, 344
Atomic Weights of the Monoisotopic Elements (Prof. Henry E. Duckworth), 595
Atomic and Molecular Structure: Principles of (W. N. Lipscomb), (Comprehensive Inorganic Chemistry, edited by Prof. M. Cannon Sneed, Prof. J. Lewis Maynard and Prof. Robert C. Brasted, Vol. 1), *review* by Dr. R. Spence, 944
Atoms: Measurements of Lifetimes of Excited States of, by the Method of Delayed Coincidences (the late S. Heron, R. W. P. McWhirter and Dr. E. H. Rhoderick), 564
Atoms and Radicals in a Glass 'Cage': Trapped (Dr. Irwin Norman and Dr. George Porter), 508
Atoxopyrimidine Action of Vitamins of the B_6 Group (Prof. Katashi Makino, Takeo Kinoshita, Yoshitomo Aramaki and Shigeru Shintani), 275
Atropa belladonna: Cuscohygrine, a Normal Constituent Alkaloid of (Dr. P. Reinouts van Haga), 833
Atropine in the Therapy of Paraoxon Poisoning: Pentamethonium as an Adjuvant to (C. A. de Candole and M. K. McPhail), 552
Attempts at Nitrogen Fixation *in vitro* (T. G. G. Wilson and E. R. Roberts), 795
Attitudes to Work (Prof. L. S. Hearnshaw), 637
Attle, E.: Awarded a postgraduate research scholarship by Courtaulds' Scientific and Educational Trust Fund, 492
Attlee, C. R.: The British Civil Service, 983
Auber, L. (Ryder, M. L., and): Abnormal Growths associated with Wool Follicles in Sheep, 743
Aubrey, K. V.: Occurrence of μ-$CaCO_3$ in Boiler Scale, 81
  Frequency Distribution of the Concentrations of Elements in Rocks, 141
Auditory Judgments: Interdependence of Temporal and (Prof. John Cohen, C. E. M. Hansel and J. D. Sylvester), 642
Audus, Prof. L. J., and Symonds, K. V.: Plant Growth-regulating Substances, 768
Audy, Dr. J. R., and Nadchatram, M.: A Method of Rearing Individual Trombiculid Mites in the Field, 1021
Augmentation of Wool-growth by l-Thyroxine and Tri-iodo-thyronine in Sheep (D. S. Hart), 1018
Auluck, Dr. F. C., and Kothari, Dr. D. S.: Random Fragmentation, 565
Aurora: Polarization of Radio Echoes from (A. G. McNamara and B. W. Currie), 1153
Austin, Dr. James B.: Management in the Research Laboratory, 1043
Australia: Aboriginal Rock-paintings in, 343
  Two Meteorites Found in, 65
Australian Atomic Energy Commission: Appointment of Prof. C. N. Watson-Munro as chief of research and development, 1085
Australian Museum, Sydney: Appointment of Dr. J. W. Evans as director, 1130
Australian National University, Canberra: Appointment of R. D. Edge as a Research Fellow in the School of Physical Sciences, 67
Australian and New Zealand Association for the Advancement of Science: Report of the Twenty-eighth Meeting, 862
Australian and New Zealand Botany (Prof. J. McLuckie and Dr. H. S. McKee), *review* by E. A., 331
Australopithecine Occiput (J. T. Robinson), 262; (Prof. S. Zuckerman), 263
Australopithecines: Nuchal Crests in (J. T. Robinson), 1197; (Prof. S. Zuckerman), 1198
Austwick, P. K. C. (McDiarmid, Dr. A., and): Occurrence of *Haplosporangium parvum* in the Lungs of the Mole (*Talpa europaea*), 843
Automatic Control for Economic Systems, *review* by Prof. G. L. S. Shackle, 421
Automatic Control and Computing at the National Physical Laboratory, 110
Automatic Fraction Cutter: Simple (P. J. Delmon), 755
Automatic Particle-sizing by Successive Counting (G. Jordanides and N. H. Chamberlain), 83
Autonomous Differentiation of some Chick Neurons Isolated in Chorion-Allantoic Grafts (Prof. Alberto Stefanelli), 974
Autoradiographic Techniques: Special Course on (Isotope School, Harwell), 589
Autoradiography of Radioactive Frog Embryos: Electron-Track (Frederick Sperling), 749
Autoxidation (Olefin): Catalysis of, by Heavy-Metal Ions in Non-Polar Media (G. L. Banks, A. J. Chalk, Miss J. E. Dawson and J. F. Smith), 274
Auxin (Endogenous): Correlation between, and its Destruction *in vivo* by 2 : 4-Dichlorophenoxyacetic Acid in Plants (James H. M. Henderson and Dawson C. Deese), 967
Avena Seedlings: Growth of Wounded Etiolated (C. L. Mer), 680
Avocado Fruit: Bacterial Soft Rot of (Dr. Zafrira Volcani), 604

BABAD, J., and others: Classification of the Antifungal Antibiotics from *Bacillus subtilis*, 1190
Bacillus subtilis: Classification of the Antifungal Antibiotics from (N. Sharon, A. Pinsky, R. Turner-Graff, J. Babad and A. P. Cercós), 1190
  Oxidative Dissimilation of Glycerol studied with Variants of (Prof. J. M. Wiame, S. Bourgeois and R. Lambion), 37
Bacteria: Preservation of (D. I. Annear), 359
  Structural Analogies of Pox Viruses and (Dr. D. Peters and W. Stoeckenius), 224
Bacteria (Growing and Non-Growing): Differentiation of, by a Staining Technique (H. E. Wade and D. M. Morgan), 920, *erratum*, 1087
Bacteria administered by Mouth: Isolation from the Lower Respiratory Tract of Chickens of (H. Williams Smith), 45
Bacterial Antagonism by *Serratia marcescens* (Alan Seaman, Dr. Malcolm Woodbine and Anna Kolasiewicz), 406
Bacterial Arrays: Crystalline, and Specific Long-Range Forces (Dr. R. J. Goldacre), 732
Bacterial Hyaluronidases: Production of Unsaturated Uronides by (Alfred Linker and Dr. Karl Meyer), 1192
Bacterial Soft Rot of Avocado Fruit (Dr. Zafrira Volcani), 604
Bacteriology at Belfast, 383
Bacteriology of Milk and Milk Products (Society for Applied Bacteriology Discussion on), 1135
Bacteriology (Applied), Society for: Election of Officers, 164
  Discussion on the Bacteriology of Milk and Milk Products, 1135
Bacteriophages: Incorporation of Halogenated Pyrimidines into the Deoxyribonucleic Acids of *Bacterium coli* and its (D. B. Dunn and Dr. J. D. Smith), 305; (Dr. Stephen Zamenhof and Mrs. Gertrude Griboff), 306
Bacterium: Interrelationships between a Yeast and a, when Growing Together in Defined Medium (Dr. S. W. Challinor and A. H. Rose), 877
  A Riboflavin-producing (Subrata Ganguly), 559
Bacterium coli and its Bacteriophages: Incorporation of Halogenated Pyrimidines into the Deoxyribonucleic Acids of (D. B. Dunn and Dr. J. D. Smith), 305; (Dr. Stephen Zamenhof and Mrs. Gertrude Griboff), 306

British Journal of Applied Physics (edited by Dr. H. R. Lang), Vol. 4, 1953, and Supplement No. 2, Static Electrification, *review*, 376
British Medusae, *review* by Prof. T. A. Stephenson, 151
British Museum (Natural History), and the Royal Scottish Museum: Training in Taxidermy, 66
British Non-Ferrous Metals Research Association: Election of Dr. Maurice Cook as chairman, 1174
British Occupational Hygiene Society: Conference on Radiation Hazards in Industry, 209, 777
British Participation in an International Atomic Energy Agency, 1038
British Pharmaceutical Conference 1954, 780
British Power Industries: Research in—Gas and Electricity, 996; Nuclear Power, 996
British Productivity Council: Industrial Engineering—Report of a visit to the U.S.A. in 1953 of a British Specialist Team on Industrial Engineering, 893
British Rayon Research Association: Appointment of Dr. George Porter as assistant director in charge of fundamental research, 1040
British Rubber Manufacturers, Research Association of: New laboratories at Shawbury to be opened by H.R.H. the Duke of Edinburgh, 910
British Rubber Producers Research Association: Technical Bulletin No. 1, Heveaplus M, 296
British School of Archaeology at Athens: Annual Report for the Session 1952–53, 633
British Scientists: United States Research Fellowships for, 164, 1173
British Society of Rheology: Conference on Rheology in Mechanical Engineering, 201
British Spiders (G. H. Locket and A. F. Millidge), Vol. 2, *review* by T. H. Savory, 100
British Standards Institution: Appointment of Dr. G. H. Beeby as chairman of the Chemical Divisional Council, 488
  British Standard 2520, Barometer Conventions and Tables, 1127
British Weed Control Conference, 385, 1177
British Welding Research Association: Ninth Annual General Meeting, 388
  Open Days, 727, 993
Brittle Specimens: Tape for Microsectioning of Very Large, Hard or (Prof. Axel Palmgren), 46
Broadcasting in Great Britain: Very-High-Frequency, 207
Broadcasting and the Press: The Public Influence of (Sir William Haley), 711
Brogan, Prof. D. W.: Canada's To-morrow, 212
Brohult, Astrid, and Holmberg, John: Alkoxyglycerols in the Treatment of Leukopenia caused by Irradiation, 1102
5-Bromouracil: *E. coli* containing, in its Deoxyribonucleic Acid (Dr. Stephen Zamenhof and Mrs. Gertrude Griboff), 307
Brook, D.: Honorary membership of the American Association of Physics Teachers conferred on, 915
Bronks, Doris, and others: Staining Reactions of Elastic Fibres with special reference to 'Elastotic Degenerations' in the Human Skin, 789
Brook, Dr. C. O. S. Blyth: Social and Individual Significance of Ageing, 683
Brookhaven Symposia in Biology: No. 6, Abnormal and Pathological Plant Growth, 776
Brooks, P. T., and others: Rust Infection Studies, 909
Brossel, J., and Blamont, J. E.: Atomic Line Spectra, 730
Brouwer, Prof. E. (Binnerts, Dr. W. T., and): Analysis of Milk in Deficiency Diseases and Intoxications of Cattle, 974
Brown, Dr. Barbara G., and others: 5-Hydroxytryptamine, its Occurrence in Cowhage, 925
Brown, C. P.: Elected a Salters' Scholar for 1954–55, 112
Brown, Dr. D. A.: To receive an award under the Commonwealth Bursaries Scheme of the Royal Society and Nuffield Foundation, 1086
Brown, Dr. F., and Jackson, Dr. H.: Thyroid Function, 826
Brown, P., and others: Chlorine Isotope Effect, 133
Brown, G. S.: Appointed senior assistant conservator of forests, Federation of Malaya, 209
Brown, Dr. J. R.: Physiological Aspects of the Heating and Ventilation of Houses in Britain, 577
Brown, P. E.: Appointed a member of the Advisory Committee on the Protection of Birds for England and Wales, 1086
Brown, R. D.: Appointed veterinary research officer (virologist), East Africa High Commission, 821
Brown, Dr. Thomas W. F.: *Obituary* of H. G. Yates, 1129
Brown, Prof. W.: Education and Extension Services in Applied Biology, 768
Brown, W. L.: *Obituary* of Prof. Antonio Minto, 632
Brown Alga: Stimulation of the Discharge of Gametangia from a, by a Change from Light to Darkness (Dr. Lionel Jaffe), 743
Brown's Coppice, a Survey (Natural History Society of King Edward VI Grammar School, Birmingham), 686
Browne, Dr. Ian C.: The Upper Atmosphere, 335
Browne (E. T.) Monograph of the Marine Biological Association of the United Kingdom (Frederick Stratten Russell), *review* by Prof. T. A. Stephenson, 151
'Browning' Reactions in Freeze-dried Extractives from the Skeletal Muscle of Codling (*Gadus callarias*), (Dr. N. R. Jones), 605
Brownlee, M.: Awarded a Mond Nickel Fellowship for 1954, 1174
Brownson, Helen L. (Tumbleson, R., and): Survey of Scientific Journals in the United States, 341
Bruce (Dr. W. S.) Memorial Prize for 1954 awarded to Dr. R. M. Laws, 113
Brundrett, Sir Frederick: Appointed chairman of the Defence Research Policy Committee, 20
Brunner's Glands of the Rabbit: Serous Cells in (B. F. Martin), 1195
Bryan, Prof. Patrick W.: Retirement from the chair of geography in University College, Leicester, 17; work of, 17
Bubbles (Air): Bursting of, at the Surface of Sea Water (B. J. Mason), 470
Buck, Peter H. (Te Rangi Hiroa). Explorers of the Pacific—European and American Discoveries in Polynesia, *review* by J. N. L. Baker, 287
Buckland Lectures for 1952 (F. T. K. Pentelow), *review* by B. A. S., 152
Buckler, B.: Appointed agricultural officer, Zanzibar, 821
Buckley (O. E.) Solid-State Physics Prize of the American Physical Society presented to Dr. J. Bardeen, 914
Buechner, Dr. W. W.: Nuclear and Meson Physics, 531
Buffalo: Normal Haematological Values in the (Dr. E. S. E. Hafez and A. Anwar), 611
Buffalo (Domestic): Sweating Mechanism in the (Dr. E. S. E. Hafez and M. M. Shafei), 1181
Buffers (Aqueous): Solubility and Electrophoretic Behaviour of Steroid-Detergent Mixtures in (Dr. Otto J. Schmid and Dr. Klaus D. Voigt), 129
Buffers and Spermine: Cultivation of *Pasteurella tularensis* in Chemically Defined Media—Effect of (Dr. J. Mager, A. Traub and N. Grossowicz), 747

Bugs (Milkweed): Corpus allatum and Egg Production in Starved (A. S. Johansson), 89
Building Frames (Steel): Design of, *review* by Prof. W. Fisher Cassie, 1026
Building Research Station: Report for 1953, 782
Buist, J. M.: Developments in Testing Rubber, 169
Bulgarian Academy of Sciences (Dr. D. R. Newth), 590
Bull, Dr. L. B.: Retirement as chief of the Division of Animal Health and Production, Commonwealth Scientific and Industrial Research Organization, 64; work of, 64
Bull Spermatozoa *in vitro*: Effect of Glycine on the Survival of (A. Roy and Marcus W. H. Bishop), 746
Bullbrook, J. A.: On the Excavation of a Shell Mound at Palo Seco, Trinidad, *review* by Dr. G. H. S. Bushnell, 287
Bullen, Prof. K. E.: Composition of the Earth's Outer Core, 505
Bulletin of Endemic Diseases (Institute of Endemic Diseases, Baghdad), 819
Bunbury, H. M. (edited by Heilbron, Sir Ian, and): Dictionary of Organic Compounds, Vols. 1–4, new edition, *review* by B. A. Ellis, 374
Bunn, C. W.: Chemistry and Physics of Synthetic Fibres, 117
Bunn, C. W., and Howells, E. R. Structures of Molecules and Crystals of Fluorocarbons, 549
Bunning, Dr. Erwin: Entwicklungs- und Bewegungsphysiologie der Pflanze, dritte Auflage, *review* by Dr. E. Ashby, 285
Bunt, J. S. (Tchan, Y. T., and): Direct Microscopy for Study and Count of Soil Protozoa, 656
Bunting, Dr. A. H.: Methods of Land Clearance for Agriculture, 68
Bunton, Dr. C. A., and others: Hydrolysis of Methylglucosides, 560
Burch, Dr. C. R.: Awarded the Rumford Medal for 1954 of the Royal Society, 908, 1030; work of, 1030
Burdett, R. A. Molecular Spectroscopy, 1165
Burgers, W. G. (Groen, L. J., and): Formation of Plates of Grey Tin, 587
Burges, Prof. A. The Species Concept in relation to the British Flora, 246
Burgess, E. Martin: Impregnation of Small Friable Objects, 587
Burgess, Prof. E. W. Social and Individual Significance of Ageing, 682
Burgess, H. J.: Appointed timber research officer, Federation of Malaya, 864
Burkitt, M. C. The Kalahari Sands of the Lunda (N. E. Angola), *review*, 331
Pleistocene Geology and Archæology of Northern France, *review*, 987
Burley, Dr. R. W. Sulphydryl Groups in Wool, 1019
Burma: The Birds of (Bertram E. Smythies), second edition, *review* by Sir Norman Kinnear, 53
Burma (Highland): Political Systems of—a Study of Kachin Social Structure (E. R. Leach), *review* by Prof. S. E. Finer, 423
Burnett, Dr. G. M. Appointed to the chair of chemistry in the University of Aberdeen, 953; work of, 953
Burnett, Dr. J. H.: The Species Concept in relation to the British Flora, 245
Burns, W. G. (Gaunt, J., and): Molecular Spectroscopy, 1166
Burr, Dr. Malcolm: *Obituary* by Dr. B. P. Uvarov, 294
Burrows, Dr. E.: The Species Concept in relation to the British Flora, 246
Burrows, Dr. E. M., and others: Occurrence of *Falkenbergia rufolanosa* in the Isle of Man, 315
Bursaries Scheme Royal Society and Nuffield Foundation Commonwealth (Awards), 18
Burstall, T. (Law, P. G., and) Scientific Observations on Heard Island, 1132
Bursting of Air Bubbles at the Surface of Sea Water (B. J. Mason), 470
Burstrom, Prof. H.: Plant Growth-regulating Substances, 768
Burton, Dr. John: Museum Treatment, 334
Burton Manor Residential College for Adult Education (Association of Agriculture and the): Course on Biology and Geography, 253
Bushe-Fox, J. P.: *Obituary* by Prof. I. A. Richmond, 860
Bushnell, Dr. G. H. S. Yale University Publications in Anthropology, No. 49, Excavations at Wari, Ayacucho, Peru, 287; No. 50, On the Excavation of a Shell Mound at Palo Seco, Trinidad, *review*, 287
Busvine, Dr. J. R. Development of Resistance to Insecticides, 541
Houseflies Resistant to a Group of Chlorinated Hydrocarbon Insecticides, 783
n-Butanol Treatment: An Improved Resolution of Cytoplasmic Protein of Rat Liver after (G. Adjutantis), 1054
Butler, Dr. C. C. Nuclear and Meson Physics, 532
Butler, Dr. C. G.: Social Insects, *review*, 622
The World of the Honeybee, *review* by Dr. H. Kalmus, 1027
Butler, Prof. J. A. V. (Lucy, J. A., and): Fractionation of Deoxyribonucleoprotein by Successive Extraction with Constant Salt Concentration, 32
Butler, Dr. J. R.: Distribution of Minor Elements in Rocks, 812
Butler, R. A. Higher Technological Education in Great Britain, 111
Butler, R. D.: Awarded a Mond Nickel Fellowship for 1954, 1174
N-*iso*Butyldienediynamide from Pellitory (*Anacyclus pyrethrum* DC.) Isolation and Structure of an (Dr. L. Crombie), 832
Buxton, Prof. J. B.: *Obituary* by Prof. T. J. Bosworth, 62
Byers, Prof. H.: Physics of Clouds and Precipitation, 938

CABORN, J. M.: Meteorology and Scottish Agriculture, 494
Cacao (Gold Coast): A Colour Test for detecting Swollen Shoot Disease in (T. W. Tinsley and G. Usher), 87
Cadmium in Sea-water (J. B. Mullin and Dr. J. P. Riley), 42
Cadmium Single Crystals Effect of Alpha-Particle Bombardment on Creep in (M. J. Makin), 752
'Cage' (Glass): Trapped Atoms and Radicals in a (Dr. Irwin Norman and Dr. George Porter), 508
Cages for Birds: Light (Dr. H. Hediger), 142
Cain, Dr. A. J. The Golgi Apparatus, 22
Cairngorms Nature Reserve, 162
Calcium and Magnesium in the Hæmolymph of Insects: A Simple Microtitration Method for the Determination of (Dr. K. van Asperen and Ida van Esch), 927
Calcium, Magnesium and Strontium: Simultaneous Determination of Sodium, Potassium; by a New Multichannel Flame-Spectrometer (Dr. Bert L. Vallee), 1050
μ-CaCO$_3$ in Boiler Scale: Occurrence of (K. V. Aubrey), 81
Calcium Ions: Instability of Milk due to a High Content of (J. Boogaerdt), 884
Calculation of Polarographic Currents for Depolarization Schemes Involving Reactions of Higher Order: Methods of (Dr. Jaroslav Koutecky), 233
Calcutt, G., and Payne, S.: Intracellular Sites of Metabolism of 3:4 Benzpyrene in Mouse Liver, 841
Calder, Ritchie: Museums, our Wasting Heritage, 333
Calderwood, G. F. N., and others: Resistance to Flow of Liquids over Solids by Thin Films extending from the Edge of Pools or from Menisci, 1009
Caldwell, Dr. D. O. Nuclear and Meson Physics, 530
Calendar: Time Counts, the Story of the (Harold Watkins), *review* by H. S. J., 945
Calendar Reform and the Seven-day Week (Elisabeth Achelis, James Avery Joyce and Daniel Sher), 488
Calf: A Case of *Shigella sonnei* Septicæmia in a (Dr. J. Deom and Dr. J. Mortelmans), 316
Californian (Southern) Earthquake of July 21, 1952, and its Aftershocks: An Engineering Study of the (Karl V. Steinbrugge and Donald F. Moran), 909
Callendar's 'Radio-Balance' for Determining the Thermal Energy of Radiation (W. B. Mann), 634
Calliphora: Secretion of Juvenile Hormone by the Corpus Allatum of (Prof. V. B. Wigglesworth), 556
Calorimetry Conference in the United States Ninth Annual, 344
Calvert, H. R. (Adams, G. H., and): Historic Astronomical Books, 1087
Calves Digestibility of a Sample of Pasture Grass by (D. G. Armstrong, T. R. Preston and R. H. Armstrong), 1182
Calvi, Ignazio: Ingegneria militare di Leonardo, *review*, 152
Camber, Dr. B.: Salicyloylhydrazide, a Reagent of Wide Use in Organic and Histochemical Analysis, 1107
Cambridge: Men of, *review* by Prof. F. J. M. Stratton, 896
Cambridge since 1900 Social Anthropology at (Prof. M. Fortes), 72
Cambridge Observatories Report for 1953, 26
Cambridge Platonists, *review* by F. I. G. Rawlins, 475
Cambridge University Educational Film Council Seventh Annual Report, 261
Cameron, C., and others: A Position Effect of the *Rh* Blood-Group Genes, 460
Cameron, Margaret P., and Freeman, Jessie S. (edited by Wolstenholme, G. E. W., assisted by): Mammalian Germ Cells, *review* by Dr. Gregory Pincus, 899
Campbell, A., and others: Toxicity and Narcotic Activity of Fluorocarbons, 885
Campbell, D. Ferroelectric Properties of Single Crystals, 1092
Campbell, D. A. R.: Appointed a senior agricultural officer, Jamaica, 209
Campbell, Dr. F. W. (Rushton, Dr. W. A. H., and): Measurement of Rhodopsin in the Living Human Eye, 1096
Campbell, Dame Janet M.: *Obituary* by Sir Arthur S. MacNalty, 722
Campbell, L. G.: Appointed agricultural engineer, Trinidad, 864
Campbell-Smith, Dr. W.: Distribution of Minor Elements in Rocks, 812
Canada: Development of, during the Past Few Decades (Dr. C. J. Mackenzie), 206
Canada's To-morrow (Robert W. Steel), 212
Canadian Agriculture and Forestry The Application of Biological Research to (Dr. K. W. Neatby), 766
Canadian Biological Publications for 1949: Bibliography of (J. Murray Speirs, Ruth Kingsmill and George W. North), 634
Canadian Geophysical Bulletins (National Research Council of Canada), Vol. 6, 954
Canadian High Polymer Forum: Sixth, 492
Canadian Westinghouse Co., Ltd.: Conference on Canada's To-morrow, 212
Cancer Campaign, British Empire: Thirty-first Annual Report covering the Year 1953, 289
Cancer Research Progress of, 289
Canine Encephalomyelitis: A Virus associated with (James H. Whittem), 359
Cann, F. R. Insect Pests of Stored Products, 767
Cannon, Dr. J. R., and others: Structure of Vitamin B$_{12}$—A Crystalline Nucleotide-free Degradation Product of Vitamin B$_{12}$, 1168
Cannon, R. T. Appointed geologist, British Guiana, 864
Cantabrigienses Alumni (compiled by Dr. J. A. Venn), Part 2, From 1752 to 1900, Vol. 6, Square–Zupitza, *review* by Prof. F. J. M. Stratton, 896
Capacitors (Ceramic): Low temperature Sintering of Titanium Dioxide for (T. V. Ramamurti, C. V. Ganapathy and Shiv Saran), 1107
Caplin, S., and others: Biosynthesis of Hæmin in Soy-bean Nodule Homogenates, 34
Capraro, Dr. V., and Garampi, M. L.: Comparative Endocrinology of Vertebrates, 544
Carbohydrase: Detection of, in Paper Electrophoresis (L. R. Wetter and June J. Corrigal), 695
Carbohydrate (Ferric): Placental Transfer of a High Molecular (Prof. Gunnar Nylander), 310
Carbohydrates: Structural Changes in Boiling Solutions of Sugar with reference to Chromatography of (Dr. T. H. Soutar and Evelyn Hampton), 801
Carbon (Porous): Alternation in the Adsorption of Aliphatic Acids on (Dr. John L. Morrison and David M. Miller), 1188
Carbon Atoms in Natural Fats: Occurrence of Fatty Acids with Uneven-numbered (Dr. F. B. Shorland), 603
Carbon Compounds: Chemistry of (edited by Dr. E. H. Rodd), Vol. 2, Part B, Alicyclic Compounds, *review* by Dr. R. A. Raphael, 669
Carbon Dioxide: Influence of, on the Toxicity of Ammonia (J. S. Alabaster and D. W. M. Herbert), 404
Carbon Dioxide Production in Soil: Effects of Antibiotics on (T. Vincents Nissen), 226
Carbon Disulphide, Benzene and Xylene Ultrasonic Absorption in Castor Oil, (Prof. A. K. Dutta and K. Samal), 976
Carbon-14 Dating—Symposium in Copenhagen, September 1–4 (Dr. H. Godwin), 868
Carbon-14 Technique: Measurements of Age by the (Prof. Hl. de Vries and G. W. Barendsen), 1138
^{14}C-Glucose-1-phosphate Exchange of, with Uridine diphosphate-glucose by the Galacto-Waldenase System (Dr. Raúl E. Trucco), 1103

Carbonaceous Solids: Paramagnetic Resonance in (Dr. D. J. E. Ingram, J. G. Tapley, Dr. R. Jackson, R. L. Bond and A. R. Murnaghan), 797
Carbonization: Heats of Reaction during, as deduced from Temperature Surveys of a Coke Oven (D. J. Millard), 1099
2-Carboxy-Pyrrole in Mucoproteins: The Precursor of (Dr. A. Gottschalk), 652
N-Carboxy-α-Amino-Acid Anhydrides: New Observations on the Chemistry of (D. G. H. Ballard, Dr. C. H. Bamford and Dr. F. J. Weymouth), 173
Carcinogenic Hydrocarbons: Action of Squalene upon (Dr. Harry Sobel and Jessie Marmorston), 553
Carcinogenesis: Experimental Chemical, and the Influence of Solvents—Research in Finland (Prof. Kai Setälä), 873
Career for the Graduate in Industry (Federation of British Industries), 1115
Carlisle, Dr. D. B.: Comparative Endocrinology of Vertebrates, 543
    Hormones and Control of Zoological Function, 720
Carlisle, H. E. and A. G: Gift of a meteorite to the Western Australian Museum, 65
Carlson, A. J.: Social and Individual Significance of Ageing, 684
Carmichael, Dr. E. A.: Localization of Function in the Adrenal Cortex, 720

Carr, L. M.: A Toxic Effect of Fluoride, 884
Carr-Saunders, Sir Alexander: The Numbers of Man and Animals, 815
Carriers of Adrenaline and Noradrenaline: Blood Platelets as (Dr. H. Weil-Malherbe and A. D. Bone), 557
Carroll, K. G., and others: A New Iron Boro-carbide, 978
Carter, Prof. C. F.: Use of Scientific Developments in Industry, 728
Carter, I.: Ferroelectric Properties of Single Crystals, 1093
Carter, Dr. S. R.: Retirement as lecturer in chemistry at the University of Birmingham, 820
Carter, T. C., and others: Partial Sex Linkage in the Mouse, 309
Cartes géologiques: Introduction à la lecture des (Antoine Bonté), deuxième édition, *review* by Dr. Gilbert Wilson, 668
Casein: Use of Glutamine by the Mammary Gland for the Synthesis of (J. M. Barry), 315
α-Casein: Phosphorus Linkages in (Dr. Gertrude E. Perlmann), 273
Cashew-nut Shell Liquid: Olefinic Nature of Anacardic Acid from Indian (V. J. Paul and Prof. Lourdu M. Yeddanapalli), 604
Cass, N., and others: Barbiturate Antagonism, 402
Cass, Rosemary, and others: Heparin and Histamine in Mast-Cell Tumours from Dogs, 318
Casselman, Dr. W. G. Bruce: The Golgi Apparatus, 22
Cassie, Prof. W. Fisher: Design of Steel Building Frames, *review*, 1026
Cassirer, Prof. Ernst: The Platonic Renaissance in England (translated by James P. Pettegrove), *review* by F. I. G. Rawlins, 475
Cast Iron Research Association, British: Open Day (Dr. J. G. Pearce), 345
Cast Trinitrotoluene: Influence of 'Surface Chilling' on the Detonative Behaviour of (T. C. Tranter), 81
    'Reaction Time' of, as a Function of the Rate of Charge Cooling (W. M. Evans and T. C. Tranter), 1100
Castagnoli, C., and Graziosi, F.: Effect of Temperature on the Inactivation of Phage labelled with Phosphorus-32, 599
Castaing, Dr. R.: Electron Optics, 825
Castelfranco, Giorgio: Il Pensiero estatico di Leonardo da Vinci, *review*, 152
Castillejo, L.: Awarded a United States Fellowship by the National Academy of Sciences, Washington, for research at Cornell University, 164
Castle, P. S.: Appointed a senior agricultural officer, Gold Coast, 492
Castor Oil, Carbon Disulphide, Benzene and Xylene: Ultrasonic Absorption in (Prof. A. K. Dutta and K. Samal), 976
Cat: Lingual Proprioception in Pig, Dog and (Mary E. Law), 1107
Catalysis (Heavy Metal): Effect of Chelating Agents on (A. J. Chalk and J. F. Smith), 802
Catalysis of Olefin Autoxidation by Heavy-Metal Ions in Non-Polar Media (G. L. Banks, A. J. Chalk, Miss J. E. Dawson and J. F. Smith), 274
Cataphoresis of Crystal Nuclei (Koichi Hirano), 268; (Prof. A. R. Ubbelohde), 269
Cater, Dr. D. B., and Phillips, Dr. A. F.: Measurement of Electrode Potentials in Living and Dead Tissues, 121
Cathode (Diffusion): A New Type of (A. H. Beck, A. B. Cutting, A. D. Brisbane and G. King), 1010
Cathode Ray Tube Traces: Photographic Recording of (F. B. Cope), 137
Cathodic Protection of Pipelines and Storage Tanks (V. A. Pritula), *review*, 376
Cathodoluminescence of Air, Quartz and Metal Films (Prof. J. B. Birks and W. A. Little), 82
Cations: Shielding Efficiency of (Dr. L. H. Ahrens), 644
Catlin, George: Exhibition at the Whitechapel Art Gallery, London, of a selection of his paintings of Red Indian Life in the 1830's, 207
Cattle: Analysis of Milk in Deficiency Diseases and Intoxications of (Dr. W. T. Binnerts and Prof. E. Brouwer), 974
    Environmental Control of Coat Changes in (N. T. M. Yeates), 609
Cattle kept in Subtropical Countries: Galactopoietic Action of Thyroxine in (Prof. M. Maqsood), 185
Cattle vaccinated with Lapinized Rinderpest Virus: Thermal Reactions of Kenya (G. R. Scott), 44
Cattle Crosses (South Devon × Dexter): Maternal Effect on Birth Weight in (D. M. Joubert and Dr. John Hammond), 647
Cattle Dips: A Polarographic Method for the Determination of the Gamma Isomer of Benzene Hexachloride in (G. W. Walker), 44
Cattle Urine: Identification of certain 'Ketosteroids' from, as Ionone Derivatives (A. H. Holtz), 316
Causation: Bertrand Russell's Theories of (Erik Gotlind), *review* by F. I. G. Rawlins, 54
Cause of Dorsiventrality in Leaves: Experiments on the (I. M. Sussex), 351; (R. Snow and Mary Snow), 352
Cave, Dr. M. S.: Plant Genera, 71
Cave Deposits (South Africa): Evidence of Fire in (Dr. Kenneth P. Oakley), 261
Cave Sites of the Mogollon Culture in New Mexico (Paul S. Martin, John B. Rinaldo and Elaine Bluhm), 997
Cell: A New Glass, for Preparative Counter-Current Distribution (M. Verzele and F. Alderweireldt), 702
Cell (Single Epithelial): Synthetic Activity of a, of the Lactating Goat Udder (K. C. Richardson and Dr. S. J. Folley), 828
Cell Activity and Deoxyribonucleic Acid Content of the Nuclei of the Thyroid Gland of the White Rat (H. Roels), 514
Cell Membrane (Red): Passage of Glucose and Glycerol across the (Freda Bowyer), 355
Cell Nuclei: Deoxyribonucleoproteins of—Sensitivity to X-Rays (Maurice H. Bernstein), 463
Cell Protection by Poliomyelitis Virus in Tissue Culture: Interference and (Dr. G. L. Le Bouvier), 649
Cell Wall (Wood): Influence of Leaf Activity on the Composition of the (E. W. J. Phillips), 85
Cell-free Extracts of *Aerobacter aerogenes*: Role of High-molecular Weight Components in the Respiratory Activity of (Dr. A. Tissières), 183
Cells: Mammalian Germ (edited by G. E. W. Wolstenholme, assisted by Margaret P. Cameron and Jessie S. Freeman), *review* by Dr. Gregory Pincus, 899
Cells (Animal and Plant): The Cultivation of (Philip R. White), *review* by Dr. Honor B. Fell, 809
Cells (Cultured): Biochemical Changes in (H. Brebner, A. C. Bottomley and Dr. J. F. Wilkinson), 1196
Cells (Human Bone Marrow) *in vitro*: Utilization of Formate-^{14}C for Synthesis of Deoxyribonucleic Acid by (Dr. L. G. Lajtha), 1013
Cells (Individual Nerve): Ribonucleotide Analysis of (Jan-Erik Edstrom and Holger Hydén), 128
Cells (Living): Measurement of the Refractive Index of Cytoplasmic Inclusions in, by the Interference Microscope (K. F. A. Ross), 836
Cells (Living Root-Tip): Effects of Ribonuclease on the Metabolism of (Prof. J. Brachet), 876
Cells (Malignant): Abnormal Properties of Histones from (Dr. H. J. Cruft, Dr. C. M. Mauritzen and Dr. E. Stedman), 580
Cells (Sarcoma): Invasiveness of (M. Abercrombie and Dr. Joan E. M. Heaysman), 697
Cells (Serous), in Brunner's Glands of the Rabbit (B. F. Martin), 1195
Cells (Tumour): Destruction of, by Rift Valley Fever Virus (Dr. N. Takemori, M. Nakano, M. Hemmi, H. Ikeda, S. Yanagida and M. Kitaoka), 698
Cells of *C. diphtheriae*: Potent Diphtheria Toxin within the (Shoki Nishida), 970
Cells of Plants Infected with Tobacco Mosaic Virus: Rapid Extraction of Intact Crystalline Inclusions from the (Dr. Miguel Rubio Huertos), 313
α-Cellulose (Cotton): Structure of (Dr. D. B. Das, M. K. Mitra and J. F. Wareham), 1058
α-Cellulose (Jute): Pentoses associated with (Dr. D. B. Das, M. K. Mitra and J. F. Wareham), 228; (Dr. P. B. Sarkar), 229
Cellulose Microfibrils in *Valonia*: Electron Diffraction Diagrams of (Prof. R. D. Preston and G. W. Ripley), 76
Celluloses (Native and Mercerized): Structures of (Dr. J. O. Warwicker), 135; (H. J. Wellard), 135; (H. J. Woods), 136
Central Glass and Ceramic Research Institute, Calcutta: *Bulletin*, Vol. 1, No. 1, 1086
Centre for Research on Macromolecules, Strasbourg, 1126
Centrifuging Method for Root Sterilization (John C. Hopkins), 1016
Ceramic Capacitors: Low-temperature Sintering of Titanium Dioxide for (T. V. Ramamurti, C. V. Ganapathy and Shiv Saran), 1187
Cercós, A. P., and others: Classification of the Antifungal Antibiotics from *Bacillus subtilis*, 1190
Cerebral Cortex: Localization of Function in the (British Association for the Advancement of Science, Section I (Physiology), and the Physiological Society, Discussion on), 718
Cervical Sympathectomy: Effect of, on the Onset of Œstrus in Ferrets (M. B. Abrams, W. A. Marshall and A. P. D. Thomson), 311
Cetoses: A New Spray Reagent for Paper Chromatography of Polyols and (Dr. Paul Godin), 134
Ceylon Hills: Wild Flowers of the (Thomas E. T. Bond), *review* by Dr. N. L. Bor, 54
Chackett, Dr. G. A., and Chackett, Dr. K. F.: Chemical Form of Phosphorus-32 produced in Aluminium by Bombardment with Nitrogen, 232
Chackett, Dr. K. F.: Appointed lecturer in physics at the University of Birmingham, 1132
Chadwick, C. S.: Awarded a postgraduate research scholarship by Courtaulds' Scientific and Educational Trust Fund, 492
Chainomatic Pycnometer for the Determination of Chlorine in Sea Water (D. J. Rochford), 641
Chakravarti, Dr. S. C.: Inhibition of Vernalization in *Linum usitatissimum* Linn. by certain Synthetic Hormones, 461
Chalk, A. J., and others: Catalysis of Olefin Autoxidation by Heavy-Metal Ions in Non-polar Media, 274
Chalk, A. J., and Smith, J. F.: Effect of Chelating Agents on Heavy Metal Catalysis, 802
Challice, Dr. C. E.: International Conference on Electron Microscopy, London 1954, 824
Challice, Dr. C. E., and Lacy, Dennis: Fine Structure of Exocrine Cells of the Pancreas, 1150
Challinor, Dr. S. W., and Rose, A. H.: Interrelationships between a Yeast and a Bacterium when Growing Together in Defined Medium, 877
Chamberlain, N. H. (Jordanides, G., and): Automatic Particle-sizing by Successive Counting, 83
Champion, Prof. H. G.: Forestry, *review* by Prof. H. M. Steven, 417
Chang, Dr. A. Z.: Position of Scientists in Communist China, 429
Changing Structure of the British Economy (Prof. E. A. Robinson), 440
Chanson, Dr. P. (Magnan, Prof. G., and): Electron Optics, 825
Chantrel, H.: Atomic Line Spectra, 729
Chapin, D. M., and others: Bell Solar Battery, 163
Chaplin, A. H.: The Place and Function of the British Museum, 911
Chapman, Dr. D.: Electronegativity and the Stability of Metal Complexes, 887
Chapman, Dr. D., and Taylor, R. J.: Infra-Red Assignments of Unsaturation in the Region 900-1,000 cm.$^{-1}$, 1011
Chapman, Dr. J. A.: Chemistry and Physics of Synthetic Fibres, 117

Chappell, J. B., and Greville, G. D. : Effect of Silver Ions on Mitochondrial Adenosine Triphosphatase, 930
Character of Offspring · Age of Parent and (Prof. K. Mather), 304
Characteristics of the Bottom Zone of Lakes (R. A. Vollenweider), 1136
Characteristics of the Offspring · Parental Age and (New York Academy of Sciences Symposium on), 304
Characteristics of Pairs of Valves . A New Circuit for Balancing the (R. E. Aitchison), 704
Characteristics of the Profundal Zone of Lakes · Biological, Physical and Chemical (International Union of Biological Sciences Symposium on), 1136
Characterization of Biosynthetic Arylsulphates : Isolation and (Dr K S. Dodgson, F. A. Rose and Dr. B. Spencer), 599
Charge Cooling 'Reaction Time' of Cast Trinitrotoluene as a Function of the Rate of (W. M. Evans and T. C. Tranter), 1100
Charged Colloid Particles · Short-range Electrical Forces between (Dr. D. M. C. MacEwan), 39
Charlesworth, Prof. J. K. : Title of emeritus professor of geology in the Queen's University, Belfast, conferred on, 1040
Charlton, M. G. : Hydrogen Reduction of Tungsten Oxides, 703
Chatham Islands : The Intertidal Flora and Fauna of the (G. A. Knox), 871
Chaudron, Prof. Georges . Preparation of Aluminium of Extreme Purity by the 'Zone Fusion' Process, 923
Chayen, Sonja (Metcalfe, Dr. George, and) · Nitrogen Fixation by Soil Yeasts, 841
Chelating Agents Effect of, on Heavy Metal Catalysis (A. J. Chalk and J. F. Smith), 802
Cheldelin, Prof. Vernon H., and others : Alternate Pathways of Glycerol Oxidation in *Acetobacter suboxydans*, 1104
  Origin of Glycine and Serine in Bakers' Yeast, 1145
Chemical Action of Ionizing Radiations—Excitation of Optical Levels by Particles of Relatively Low Energy (Dr. Joseph Weiss), 78
Chemical Actions of Ionizing Radiations on Liquids (Société de Chimie Physique Discussion on), 998
Chemical Analysis of Industrial Solvents (Dr. Morris B. Jacobs and Dr. Leopold Scheflan), *review* by C. Whalley, 197
Chemical Aspects of Abnormal Growth . Some (Prof. F. Bergel), 156
Chemical Aspects of Basic Mechanisms in Radiobiology : Physical and (Proceedings of an Informal Conference held at Highland Park, Illinois, 1953, edited by John L. Magee, Martin D. Kamen and Robert L. Platzman), 389
Chemical Carcinogenesis and the Influence of Solvents : Experimental—Research in Finland (Prof. Kai Setälä), 873
Chemical Characteristics of the Profundal Zone of Lakes · Biological, Physical and (International Union of Biological Sciences Symposium on), 1136
Chemical Composition of Marine Organisms : The Elementary (A. P. Vinogradov), translated from the Russian by Julia Efron and Jane K. Setlow, *review* by Dr. L. H. N. Cooper, 808
Chemical Composition of Uredospores of Wheat Stem Rust (*Puccinia graminis tritici*), (Neville Prentice and L. S. Cuendet), 1151
Chemical Constitution : Odour and (J. Timmermans), 235
Chemical Engineering in Great Britain (Stanley Robson), 819
Chemical Engineers, Institution of : Presidential Address (Stanley Robson), 819
Chemical Form of Phosphorus-32 produced in Aluminium by Bombardment with Nitrogen (Dr. G. A. Chackett and D . K. F. Chackett), 232
Chemical Industry, Society of : Messel Memorial Lecture (Lord Cherwell), 349
  Formation of a Pesticides Group, 540
Chemical Industry, Society of (Agriculture Group). Discussion on Methods of Land-Clearance for Agriculture, 68
Chemical Industry, Society of (Plastics and Polymer Group) Symposium on the Chemistry and Physics of Synthetic Fibres, 116
Chemical Industry, Society of (Aberdeen Section and the Food and Agriculture Groups) and the Scottish Branch of the Institute of Biology : Conference on the Utilization as Food of Fish and Agricultural Products, 209
Chemical Laboratory Apparatus, Instruments and Techniques Exhibition of (Manchester and District Section of the Royal Institute of Chemistry), 1174
Chemical Manufacturers (British), Association of : Proceedings of the Conference on Work Study, 490
Chemical Pathology at St. Mary's Hospital Medical School, London, 537
Chemical Physiology of Contraction in Body and Heart Muscle (Prof. A. Szent-Gyorgyi), *review* by J. R. Bendall, 477
Chemical Research (Meeting of the Scientific Film Association for the introduction and exhibition of films of advances in), 492
Chemical Research Laboratory, Teddington : Report for 1953, 170
  Open Days, 817
Chemical and Allied Industries · Minerals for the (Sydney J. Johnstone), *review* by V. A. Eyles, 574
Chemical and Plastic Materials Exhibition in Paris, 540
Chemically Defined Media · Cultivation of *Pasteurella tularensis* in—Effect of Buffers and Spermine (Dr. J. Mager, A. Traub and N. Grossowicz), 747
Chemicals : Organic, *review* by B. A. Ellis, 374
Chemicals in Food (Sir Frank Engledow), 295
Chemisorption on Metals (M. McD. Baker and Sir Eric Rideal), 1185
Chemistry · College (Harry H. Sisler, Calvin A. Van der Werf and Arthur W. Davidson), *review* by G. Fowles, 669
  Comprehensive Inorganic (edited by Prof. M Cannon Sneed, Prof. J. Lewis Maynard and Prof. Robert C. Brasted), Vol. I, Principles of Atomic and Molecular Structure (W. N. Lipscomb), Theoretical and Applied Nuclear Chemistry (P. R. O'Connor), The Actinide Series (G. T. Seaborg), *review* by Dr. R Spence, 944
  Grants for Research in (Chemical Society), 209
  Industrial and Manufacturing (Geoffrey Martin), Part I, Organic, seventh edition revised by Edward I. Cooke, *review* by H. M. Langton, 419
  Inorganic (Dr. E. de Barry Barnett and Dr. C. L. Wilson), *review*, 7
  New Ideas in (Sir John Lennard-Jones), 438
  Nobel Prize for, for 1954 awarded to Prof. Linus Pauling, 907
  Organic, and Analysis (Dr. Cecil L. Wilson), 591
  Organic, in the Arts and Manufactures, *review* by H. M. Langton, 419
  Physical, of Metals (Dr. Lawrence S. Darken and Dr. Robert W. Gurry), *review* by Prof. F. C. Thompson, 624
  Research in (Ramsay Memorial Fellowship Awards for 1954–55), 112
  Research Studentships in (British Celanese, Ltd., Awards), 681
  Seventeenth-Century, the Phlogiston Theory and Dalton's Atomic Theory (Prof. J. R. Partington), 291
  Synthetic Organic (Romeo B. Wagner and Prof Harry D. Zook), *review* by Prof. John Read, 576
Chemistry at Aberdeen, 953
Chemistry at Dundee, 586
Chemistry at the Imperial College of Science and Technology, 205
Chemistry at University College, London, 64
Chemistry (Analytical) : Ion Exchanges in (Prof. Olof Samuelson), *review* by E. Q Laws, 1119
Chemistry (Industrial) Seventeenth International Congress of, 386
Chemistry (Inorganic) . A Modern View of, *review* by Dr. R. Spence, 944
Chemistry (Nuclear) : Theoretical and Applied (P. R. O'Connor), (Comprehensive Inorganic Chemistry, edited by Prof. M. Cannon Sneed, Prof. J. Lewis Maynard and Prof. Robert C. Brasted, Vol. I), *review* by Dr. R. Spence, 944
Chemistry (Organic) : Elsevier's Encyclopaedia of (edited by F Radt), Series 3, Carboisocyclic Condensed Compounds, Vol. 12B, Naphthalene (A), Compounds containing one Naphthalene Nucleus, Naphthoic Acids and their Halogen, Nitrogen and Hydroxyl Derivatives, *review* by Dr. J. W. Cook, 1073
  Research Fellowship in the field of (sponsored by the Geigy Company for one year in the University of Birmingham), 1132
  Summer School in (Institute of Chemistry of Ireland), 590
Chemistry (Physical and Inorganic), at Belfast, 110
Chemistry (Physiological) . Essentials of (Prof Arthur K Anderson), fourth edition, *review* by Prof. J. N. Davidson, 764
Chemistry (Pure and Applied) · Fourteenth International Congress of 588, 777
Chemistry (Pure and Applied), International Union of . Eighteenth Conference, 588, 777
Chemistry, Royal Institute of (Manchester and District Section) · Exhibition of Chemical Laboratory Apparatus, Instruments and Techniques, 1174
Chemistry, Institute of, of Ireland : Summer School in Organic Chemistry (Eva M. Philbin), 590
Chemistry of Carbon Compounds (edited by Dr. E. H. Rodd), Vol. 2, Part B, Alicyclic Compounds, *review* by Dr. R A Raphael, 669
Chemistry in relation to the Development of the Nervous System (Mental Health Research Fund first International Neurochemical Symposium), 455
Chemistry of Keratin Formation Histology and (Dr. Howard A Bern), 509
Chemistry of N-Carboxy-α-Amino-Acid Anhydrides : New Observations on the (D. G. H. Ballard, Dr. C. H. Bamford and Dr. F. J. Weymouth), 173
Chemistry of Heterocyclic Compounds, *review* by Dr. James D. Loudon, 241
Chemistry of Muscle Contraction—Contraction of Muscle without Fission of Adenosine Triphosphate or Creatine Phosphate (Prof. A Fleckenstein, Dr. J. Janke, Dr. R. E. Davies and Prof. H. A. Krebs), 1081 , Is Adenosine Triphosphate broken down during a Single Muscle Twitch ? (Dr. W. F. H. M. Mommaerts), 1083
Chemistry of some Natural Pigments, 990, *erratum*, 1132
Chemistry and Biology : Nuclear Science in Physics, *review* by Dr. E. Bretscher, 1162
Chemistry and Physics of Synthetic Fibres (Plastics and Polymer Group of the Society of Chemical Industry Symposium on), 116
Chemists and Engineers in the United States . Registration of, 65
Chemotherapeutic Experiments with Natural Constituents of the Body (Dr. Hans Meyer-Doring), 355
Cherwell, Lord : Appointed a member of the United Kingdom Atomic Energy Authority, 64
  Messel Memorial Lecture to the Society of Chemical Industry, 349
Chester, G. V. . Awarded a Research Fellowship in the United States by the National Academy of Sciences, Washington, 1173
Chester, Dr. K. Starr : Forecasting and Assessment of Plant Diseases, 769
Chick Embryos · Infection of Chickens and, with the Viruses of Foot-and-Mouth Disease and of Vesicular Stomatitis (H. H Skinner), 1052
Chick Neurons Isolated in Chorion-Allantoic Grafts · Autonomous Differentiation of some (Prof. Alberto Stefanelli), 974
Chickens Isolation from the Lower Respiratory Tract of, of Bacteria administered by Mouth (H. Williams Smith), 45
Chickens and Chick Embryos: Infection of, with the Viruses of Foot-and-Mouth Disease and of Vesicular Stomatitis (H. H. Skinner), 1052
Child Through the Ages (Exhibition at the Wellcome Historical Medical Museum), 822
Childe, Prof. V G. : *Obituary* of Prof. H Frankfort, 337
  The First Colonization of Britain by Farmers, *review*, 575
Children : The Health of, 822
Children (Handicapped) : Social Problems of, 862
Children, National Committee for the Defence of · Making our Way (Mrs. Peggy Jay), 862
Chilka Lake : Fisheries of (S. Jones and K. H. Sujansingani), 1131
Chilton, D. : Museum Treatment, 334
Chimie et des Matières Plastiques : Third Salon de la, 540
Chimie Physique, Société de : Discussion on the Chemical Actions of Ionizing Radiations on Liquids, 998
China (Communist) · Position of Scientists in (Dr. A. Z. Chang), 429
China To-day . Science in, 429
Chipman, Prof. John : Awarded the Brinell Medal of the Swedish Academy of Engineering Sciences, 955
Chisholm, E. de C., and others : Meteorology and Scottish Agriculture, 494
Chitty, Dr. D. H. : The Numbers of Man and Animals, 816
Chitty, Dr. D. H., and Southern, H. N. (edited by) : Control of Rats and Mice, Vol. I, Rats ; Vol. 2, Rats ; Vol. 3, House Mice, *review* by S. A. Barnett, 1118
Chlorella : Molybdenum in the Growth and Metabolism of (Dr. J. F. Loneragan and Prof. Daniel I. Arnon), 459
Chloride in the 'Symplasm' of *Vallisneria* Leaves · Transport of (Prof. W. H. Arisz), 223

Chlorinated Hydrocarbon Insecticides: Houseflies Resistant to a Group of (Dr. J. R. Busvine), 783
Chlorine (Liquid): Estimation of Impurities in, by Infra-red Absorption Spectrophotometry (A. W. Pross), 467
Chlorine in Sea Water: A Chainomatic Pycnometer for the Determination of (D. J. Rochford), 641
Chlorine Dioxide: Photolysis of, and Absolute Rates of Chlorine Monoxide Reactions (F. J. Lipscomb, Prof. R. G. W. Norrish and Dr. G. Porter), 785
Chlorine Isotope Effect (Rosalie M. Bartholomew, F. Brown and M. Lounsbury), 133
Chlorine Monoxide Reactions: Photolysis of Chlorine Dioxide and Absolute Rates of (F. J. Lipscomb, Prof. R. G. W. Norrish and Dr. G. Porter), 785
p-Chloromercuribenzoic Acid: Use of, in the Determination of Ascorbic Acid in the presence of Sulphydryl Compounds (J. A. Owen, B. Iggo and D. B. Horn), 701
Chlorophyll in Young Shoots of European Beech (*Fagus sylvatica*) in Winter (K. Gundersen), 87
Chlorophyllide, the Probable Precursor of a Growth Inhibitor (Mrs. G. Blaauw-Jansen), 312
Chloroplasts: Cytochrome *b* Component of (Dr. Robert Hill), 501
Chloroplasts (Isolated): Photosynthesis by (Prof. Daniel I. Arnon, Dr. M. B. Allen and Dr. F. R. Whatley), 394
Cholesterol: Nutritive Value of Lucerne Protein Concentrates, fed with and without (S. J. Cowlishaw, D. E. Eyles, W. F. Raymond and J. M. A. Tilley), 227
Chorion-Allantoic Grafts: Autonomous Differentiation of some Chick Neurons isolated in (Prof. Alberto Stefanelli), 974
Christensen, Prof. Bert E., and others: Origin of Glycine and Serine in Bakers' Yeast, 1145
Christmas Lectures for Young Persons, 1040
Chromatograms (Paper): A New Method for the Colorimetric Estimation of Amino-Acids on (F. A. Isherwood and D. H. Cruickshank), 123
Chromatograms of the Keto-acid 2,4-Dinitrophenylhydrazones: Identification of an Artefact on (G. H. N. Towers and D. C. Mortimer), 1189
Chromatograms of a Mutant Stock of *Drosophila*: Fluorescent Substances in (Dr. Elisabeth Goldschmidt), 883
Chromatographic Method for the Estimation of Oleic and Linoleic Acids in the presence of Straight-chain Saturated Fatty Acids (W. Mary L. Crombie, R. Comber and S. G. Boatman), 181
Chromatographic Method for the Quantitative Estimation of Amino-Acids: A Paper (Dr. Anthony L. Levy), 126
Chromatographic Methods of Inorganic Analysis (Dr. F. H. Pollard and Dr. J. F. W. McOmie), *review* by E. Q. Laws, 1119
Chromatographic Separation of the Aminofluorescein Isomers (Dr. J. De Repentigny and Dr. A. T. James), 927
Chromatography (Prof. F. J. Coll), 591
Chromatography, a Review of Principles and Applications (Edgar Lederer and Michael Lederer), *review*, 5
Chromatography: Inorganic (Orsino C. Smith), *review* by E. Q. Laws, 1119
  Paper (Dr. Friedrich Cramer), second edition (translated by Leighton Richards), *review* by R. A. Wells, 1164
  Principles and Applications of, *review*, 5
Chromatography (Paper): Determination of Sour Orange Rootstock by (Prof. Raymond M. Selle), 140
  Modified Horizontal Migration Method in (N. C. Ganguli), 189
Chromatography (Preparative): A New Paper Column for (Lennart Hagdahl and Dr. Carl Erik Danielson), 1062
Chromatography (Vapour-phase): Improvements in, at Relatively High Temperatures (F. R. Cropper and A. Heywood), 1063
Chromatography of Carbohydrates: Structural Changes in Boiling Solutions of Sugar with reference to (Dr. T. H. Soutar and Evelyn Hampton), 801
Chromatography of Guanidino Amino-acids from Synthetically Modified Gelatin: Ion-Exchange (J. E. Eastoe and A. W. Kenchington), 966
Chromatography of Organic Acids: Paper (Prof. F. Smith and D. Spriestersbach), 466
Chromatography of Polyols and Cetoses: A New Spray Reagent for Paper (Dr. Paul Godin), 134
Chromatography of Tissue Histamine (Dr. G. B. West and Dr. J. F. Riley), 882
Chromatography as a Tool for Mosquito Taxonomy: Paper—The *Culex pipiens* Complex (Dr. Don W. Micks), 217
Chromatography and Ion Exchange: Analysis by, *review* by E. Q. Laws, 1119
Chromatophore-expanding Activity of Pituitary Extracts: Inactivation of the, by Ascorbic Acid (Dr. Marg. Holzbauer and Dr. R. Rigler), 877
Chromium (Dr. A. H. Sully), *review* by Dr. W. Hume-Rothery, 422
  Metallurgy of, *review* by Dr. W. Hume-Rothery, 422
Chromosomal Biotypes in Emmer Wheat (Dr. P. N. Bhaduri and P. N. Ghosh), 934
Chromosome Aberrations produced by 8-Ethoxycaffeine: Effect of Oxygen on the Frequency of (Dr. Bengt Kihlman), 561
Chromosomes in the Rabbit Blastocyst: A Simplified Method for Spreading the (Ole Venge), 608
O Chromosomes and the Distribution of the Dental Fricatives in Europe (R. W. Thompson), 1095
X-Chromosomes in *Drosophila melanogaster*: Stability in Development and Relational Balance of (G. Tebb and Dr. J. M. Thoday), 1109
Chrysanthemums (Non-vernalized): Acceleration of Flowering in, by the Removal of Apical Sections of the Stem (Dr. D. Vince and D. T. Mason), 842, (Dr. W. W. Schwabe), 1022
Chrysophyceae: Cobalamin Requirement in (M. R. Droop), 520
Chrystal, R. N.: Appointed forest entomologist, Cyprus, 209
Chubb, E. C.: Elected an honorary fellow of the Museums Association, 334
Cianchi, Renzo: Vinci Leonardo e la sua famiglia, *review*, 152
Ciba Foundation: Appointment of Prof. F. G. Young and Prof. A. Haddow to the executive council, 113
  Support for Gerontological Studies, 162
  Colloquium on Aspects of Ageing, 162
  Symposium on Mammalian Germ Cells (edited by G. E. W. Wolstenholme, assisted by Margaret P. Cameron and Jessie S. Freeman), *review* by Dr. Gregory Pincus, 899
Ciliate Protozoa (Rumen): A Remarkable Disintegrative Effect of Skatole upon certain (J. Margaret Eadie and Dr. A. E. Oxford), 973
Cini, Dr. M.: Nuclear and Meson Physics, 531
Circuit for Balancing the Characteristics of Pairs of Valves: A New (R. E. Aitchison), 704
Circuits of Television Receiver Valves: Data and (J. Jager), *review* by Dr. R. L. Smith-Rose, 99
d-*iso*Citric Acid: The *d*-*iso*Citric Lyase System—the Formation of Glyoxylic and Succinic Acids from (Dr. J. A. Olson), 695
d-*iso*Citric Lyase System—the Formation of Glyoxylic and Succinic Acids from *d*-*iso*Citric Acid (Dr. J. A. Olson), 695
City Museum, Bristol: Report of the Committee for 1953, 499
  Stratford Mill in Blaise Castle House Folk Park: Handbook to, 499
City and Guilds of London Institute: Annual Report, 725
Civil Engineering To day (David Watson), 1134
Civil Engineers, Institution of: Presidential Address (David Watson), 1134
Civil Servant in Britain, 281
Civil Servants: Professional, Technical and Scientific, 387
Civil Service: The British, 983
Civil Service: British, 1854–1954 (Wyn Griffith), 296
Civil Service (Scientific): Promotion of Individual Research Workers, 999
Civil Service in the Constitution (Prof. K. C. Wheare), 281
Civil Service, Royal Commission on the: Evidence submitted by the Institution of Professional Civil Servants, 387

Clark, Prof. W. E. Le Gros: The Piltdown Bones and 'Implements', 61
  Obituary of Prof. F. Wood Jones, 772
Clark (Wallace) International Management Award for 1955 awarded to Lieut.-Colonel L. F. Urwick, 1132
Clarke, G. R., and others: Determination of the Absolute Concentration of Deuterium in Thames River Water, 469
Clarke, H. M.: The Synchronous Induction Motor, *review*, 944
Clarke, Robert: A Great Haul of Ambergris, 155
Clarke, Colonel R. S.: Appointed a member of the Advisory Committee on the Protection of Birds for England and Wales, 1086
Classification of the Antifungal Antibiotics from *Bacillus subtilis* (N. Sharon, A. Pinsky, R. Turner-Graff, J. Babad and A. P. Cercós), 1190
Classification for Forestry: Oxford System of Decimal (Prof. E. P. Stebbing), 869
Classification of the Terrestrial Heteroptera (Geocorisae), (Dennis Leston, J. G. Pendergrast and T. R. E. Southwood), 91
Clay, Sir Henry: *Death* of, 253
Clay, Dr. R. S.: *Obituary* by the Rev. W. L. Doherty, 16
Claydon, R. K.: Appointed veterinary officer, Nyasaland, 492
Clayson, Dr. D. B., and others: Induction of Tumours with 1-(2-Tolylazo)-2-naphthol (Oil Orange *TX*), 879
Clayton, Mrs. R. M.: Localization of Embryonic Antigens by Antisera labelled with Fluorescent Dyes, 1059
Clayton Memorial Lecture of the Manchester Literary and Philosophical Society (Sir William Haley), 711
Cleaned Iron Objects: Protecting (L. Biek, E. S. Cripps and D. M. D. Thacker), 431
Cleavage in European Science, *review* by F. I. G. Rawlins, 666
Cleavage Face, of Galena: Adsorption of Alkyl Xanthate and Dithiophosphate on a, as revealed by Electron Diffraction (Hitosi Hagihara and Hajime Uchikoshi), 80
Clegg, E. J.: Fertility, 493
Clegg, Dr. L. F. L.: Bacteriology of Milk and Milk Products, 1135
Clemmow, P. C.: The Physics of the Ionosphere, 867
Clifton, R. G. (Williams, J. L. S., and): Developments in Testing Rubber, 169
Climate (Terrestrial): A Climatological and Astronomical Interpretation of the Ice Ages and of the Past Variations of (Dr. E. J. Öpik), 172
Climates (Tropical and Sub-Tropical): Breeding for Beef in (D. M. Joubert), 915
Climatological and Astronomical Interpretation of the Ice Ages and of the Past Variations of Terrestrial Climate (Dr. E. J. Öpik), 172
Clinical Biochemists, Association of, and the Association of Clinical Pathologists: Joint Meeting on Thyroid Function, 826
Clinical Pathologists, Association of (Association of Clinical Biochemists and the): Joint Meeting on Thyroid Function, 826
Clostridium histolyticum: Separation of Proteolytic Enzymes of (Robert DeBellis, Ines Mandl, John D. MacLennan and Edward L. Howes), 1191
Clostridium welchii (*perfringens*) BP6K: Inhibition by Cystine of Lecithinase (α-Toxin) Production in (Harry Gooder and Lois Bigger Gehring), 1054
Clothe Us: How Science Helps to (Dr. H. A. Thomas), 1040
Clouds and Precipitation: Physics of (Swiss Federal Commission for the Study of Hail Formation and Prevention International Symposium on), 957
Clunies-Ross, Sir Ian: John Anderson Gilruth—the Influence of his Life and Work on the Development of the Livestock Industries of the Commonwealth, 1131
Clusters of Stars: New General Catalogue of Nebulae and (J. L. E. Dreyer), 634
Coagulation and Flocculation (Faraday Society General Discussion on), 344
Coal Board, National: Gift of £3,475 to the Department of Mining, University of Leeds, for special research projects, 863
  Research Work on Smokeless Fuels (Sir Charles Ellis), 1130
  Grant of £1,600 to the University of Birmingham, for research in the Department of Mining, 1132
Coal Board, National (Northeastern Division): Gift of £3,000 to the Department of Mining, University of Leeds, being renewal of an annual grant, 863
Coal-like Materials: Paramagnetic Resonance, a New Property of (J. Uebersfeld, A. Étienne and J. Combrisson), 614

Coalfields of Great Britain (edited by Sir Arthur Trueman), *review* by Dr. J. E. Richey, 418
Coals Infra-Red Spectra of (R. R. Gordon, W. N. Adams, G. J. Pitt and G. H. Watson), 1098
Coast and the Geographer (Prof. J. A. Steers), 440
Coastal Flooding in Britain, 193
Coat Changes in Cattle . Environmental Control of (N. T. M. Yeates), 609
Coate, Godfrey T. (Reintjes, Prof. J. Francis, and) : Principles of Radar (by members of the Staff of the Radar School, Massachusetts Institute of Technology), third edition, *review*, 7
Cobalamin Requirement in Chrysophyceae (M. R. Droop), 520
Cobaltic Oxide, Co O_3 : Nutritional Availability of (Sidney Mittler), 88
Cocaine : Stereochemistry of (Prof. G. Fodor, Ö. Kovács and I. Weisz), 131
Cocarboxylasic Activity of Thiamine Phosphoric Esters (Gertrudis de la Fuente and R. Diaz-Cadavieco), 1014
Cochran, Dr. W. (Lipson, Dr. H., and) · The Determination of Crystal Structures, *review* by Dr. D. Rogers, 943
Cockcroft, Sir John Appointed a member of the United Kingdom Atomic Energy Authority, 64
  Progress in Nuclear Physics, *review*, 150
  Elected president of the European Atomic Energy Society, 252
  Elected president of the Institute of Physics, 260
  Recent Developments in Nuclear Physics, 438
  Awarded a Royal Medal for 1954 of the Royal Society, 953, 1030 , work of, 1030
Cockcroft, Sir John, and others : Rutherford by Those who Knew Him, 161
Cockcroft, M. G. · Appointed lecturer in industrial metallurgy at the University of Birmingham, 820
Cocker, Prof. Wesley : New Reagents and Techniques, 591
Cocoa Fermentation (R. V. Wadsworth and G. R. Howat), 392
Codling (*Gadus callarias*) 'Browning' Reactions in Freeze-dried Extractives from the Skeletal Muscle of (Dr. N. R. Jones), 605
Coe, R. F. : Resignation as Department of Scientific and Industrial Research Fellow in physics at the University of Birmingham, 820
Coefficients (Binomial) Table of (prepared for the Mathematical Tables Committees of the British Association and the Royal Society under the editorship of J. C. P. Miller), *review* by J. H. Pearce, 1075
Coelacanths : New Facts about (Prof. J. Millot), 426
Co-enzyme Deficiency : Apparent Induced Enzyme Formation due to (A. A. Hakim and Prof. Frank C. Happold), 358
Coenzyme A in the Oxidation of Fat . Participation of (Prof. F. Lynen), 962

De, Dr. N. N. (Raja Rama Rao, M. R., and) : Abdominal Lymphatic Tissue as a Source of Hyperglycaemic Glycogenolytic Factor, 229
De, Prof. S. N. : To receive an award under the Commonwealth Bursaries Scheme of the Royal Society and Nuffield Foundation, 1086
de Beer, Sir Gavin : The Piltdown Bones and 'Implements', 61
  Archaeopteryx and Evolution, 439
DeBellis, Robert, and others : Separation of Proteolytic Enzymes of *Clostridium histolyticum*, 1191
de Broglie, Louis : The Revolution in Physics, *review* by Prof. W. H. McCrea, 762
de Broglie, Louis (Réunions d'études et mises au point tenues sous la présidence de) : Les applications de la mécanique ondulatoire à l'étude de la structure des molécules, *review* by S. Weintroub, 989
de Broglie on Quantum Theory, *review* by Prof. W. H. McCrea, 762
de Broglie Waves : Geometrical Mechanics and (Prof. J. L. Synge), *review* by Dr. Abdus Salam, 900
de Candole, C. A., and McPhail, M. K. : Pentamethonium as an Adjuvant to Atropine in the Therapy of Paraoxon Poisoning, 552
de Moivre, Abraham (1667–1754), 950
De Repentigny, Dr. J., and James, Dr. A. T. : A Chromatographic Separation of the Aminofluorescein Isomers, 927
de Vries, Prof. Hl., and Barendsen, G. W. : Measurements of Age by the Carbon-14 Technique, 1138
Deacon, Dr. G. E. R. : Dedication of the Laboratory of Oceanography, Woods Hole, 107
Dead Tissues : Measurement of Electrode Potentials in Living and (Dr. D. B. Cater and Dr. A. F. Phillips), 121
Dean, Dr. F. M. : Awarded a United States Fellowship by the National Academy of Sciences, Washington, for research at the University of California, 164
Debye, Peter J. W. : The Collected Papers of, *review* by Sir Eric Rideal, 4
Decalin and Steroid Systems : Fluorescent Glass Models of *cyclo*Hexane, (W. Brady), 590
Decarboxylation of γ-Methyleneglutamic Acid by Plant Extracts : Enzymic (L. Fowden), 208
Decay in the Sugar Maple (*Acer saccharum*) in Ontario (V. J. Nordin), 343
Decimal Classification for Forestry : Oxford System of (Prof. E. P. Stebbing), 869
Decomposition of Ethyl Nitrite : Effect of Nitrogen Dioxide on the Thermal (Dr. F. H. Pollard, A. E. Pedler and C. J. Hardy), 979
Decomposition of Oxalate by *Streptomyces* (S. R. Khambata and Prof. J. V. Bhat), 696
Dedijer, Stevan : Federation of Mathematics and Physics Societies of Yugoslavia—Congress in Zagreb, 1179
Dee, Prof. P. I. : Nuclear and Meson Physics, 530
Deep Sounding from a Southern Hemisphere (Robert L. Fisher and Roger Revelle), 469
Deep and Shallow Incisions : Effect of, on Organogenesis at the Fern Apex (Prof. C. W. Wardlaw and E. G. Cutter), 734
Dearing, J. W. : Appointed agricultural officer, Fiji, 821
Deese, Dawson C. (Henderson, James H. M., and) : Correlation between Endogenous Auxin and its Destruction *in vivo* by 2 : 4-Dichlorophenoxyacetic Acid in Plants, 967
Deevey, E. S. : Biological, Physical and Chemical Characteristics of the Profundal Zone of Lakes, 1137
Defects in Crystalline Solids (International Union of Physics Conference on), 377
Defence (National) : Financial Control of Research for, 95
Defence of Children, National Committee for the : Making our Way (Mrs. Peggy Jay), 862
Defence Research Policy Committee : Appointment of Sir Frederick Brundrett as chairman, 20
Deficiency Diseases and Intoxications of Cattle : Analysis of Milk in (Dr. W. T. Binnerts and Prof. E. Brouwer), 974
Definition and Measurement of Standards and Levels of Living : Report on International (United Nations, the International Labour Office and Unesco), 350
Degree Students : Modern Physics for, *review* by R. W. Haywood, 240
Delayed Coincidences : Measurements of Lifetimes of Excited States of Atoms by the Method of (the late S. Heron, R. W. P. McWhirter and Dr. E. H. Rhoderick), 564
Delayed Effect of Mustard Gas : Some Cytological Observations on the (Dr. G. E. Nasrat), 968
Delayed Fertilization and Spontaneous Triploidy in Mouse Embryos : Independence of (A. H. Gates and Dr. R. A. Beatty), 356
Delmon, P. J. : Simple Automatic Fraction Cutter, 755
Demain, A. L., and Phaff, H. J. : Composition and Action of Yeast Polygalacturonase, 515
Democracy (American) : Government and Science, their Dynamic Relation in (Don K. Price), *review* by R. Brightman, 475
Demolon, Albert : *Obituary* by Dr. R. K. Schofield, 1171
Dennesy, Joan M. (Winder, Frank, and) : Metaphosphate in Mycobacterial Metabolism, 353
Denny Scholarship in Marine Engineering (Institution of Naval Architects), 1132
Denny Scholarship in Naval Architecture (Institution of Naval Architects), 1132
Dental Fricatives in Europe : The O Chromosomes and the Distribution of the (R. W. Thompson), 1095
Denton, W. H., and others : Determination of the Absolute Concentration of Deuterium in Thames River Water, 469
Deom, Dr. J., and Mortelmans, Dr. J. : A Case of *Shigella sonnei* Septicaemia in a Calf, 316
Deoxyribonucleic Acid : Biological Role of (Dr. Alfred Marshak and Celia Marshak), 919
  E. coli containing 5-Bromouracil in its (Dr. Stephen Zamenhof and Mrs. Gertrude Griboff), 307
  Utilization of Formate-^{14}C for Synthesis of, by Human Bone Marrow Cells *in vitro* (Dr. L. G. Lajtha), 1013
Deoxyribonucleic Acid Content of the Nuclei of the Thyroid Gland of the White Rat : Cell Activity and (H. Roels), 514
Deoxyribonucleic Acids of *Bacterium coli* and its Bacteriophages : Incorporation of Halogenated Pyrimidines into the (D. B. Dunn and Dr. J. D. Smith), 305 ; (Dr. Stephen Zamenhof and Mrs. Gertrude Griboff), 306
Deoxyribonucleoprotein : Fractionation of, by Successive Extraction with Constant Salt Concentration (J. A. Lucy and Prof. J. A. V. Butler), 32
Deoxyribonucleoproteins of Cell Nuclei—Sensitivity to X-Rays (Maurice H. Bernstein), 463
Deoxyribose Compounds : Colour Reaction for (Dr. Lionel A. Manson), 967
Depolarization Schemes involving Reactions of Higher Order : Methods of Calculation of Polarographic Currents for (Dr. Jaroslav Koutecky), 233
Dermatitis in Pigs : A Peculiar Nutritional (G. Thomas and A. Eden), 553
Derraugh, L. F. : Appointed a senior agricultural officer, Gold Coast, 492

Desert Locust, *Schistocerca gregaria* Forsk : An Epizootic among Laboratory Stocks of (J. P. Stevenson), 222
Desiccation : Liberation of Amino acids by Plant Roots in relation to (H. Katznelson, J. W. Rouatt and T. M. B. Payne), 1110
Design of Steel Building Frames, *review* by Prof. W. Fisher Cassie, 1026
Design and Accuracy of Volumetric Glassware, 635
Design and Application of Small Digital Computers (American Institute of Electrical Engineers, the Institute of Radio Engineers and the Association of Computing Machinery fourth Annual Eastern Joint Computer Conference and Exhibition), 432, 681
Dessens, H. : Physics of Clouds and Precipitation, 957
Destruction *in vivo* by 2 : 4 Dichlorophenoxyacetic Acid in Plants : Correlation between Endogenous Auxin and its (James H. M. Henderson and Dawson C. Deese), 967
Destruction of Tumour Cells by Rift Valley Fever Virus (Dr. N. Takemori, M. Nakano, M. Hemmi, H. Ikeda, S. Yanagida and M. Kitaoka), 698
Detection of Carbohydrase in Paper Electrophoresis (L. R. Wetter and Jane J. Corrigal), 695
Detection by Paramagnetic Resonance : Stabilization of Free Radicals by Adsorption—(Dr. D. Bijl, Dr. H. Kainer and A. C. Rose-Innes), 830
Detection and Estimation of Germanium : Fluorometric (N. Appala Raju and Prof. G. Gopala Rao), 400
Detergents (Non-ionic) : Use of Adsorption Columns in the Analysis of Emulsions stabilized with (T. Green, R. P. Harker and F. O. Howitt), 659
Determination of the Absolute Concentration of Deuterium in Thames River Water (G. R. Clarke, W. H. Denton and P. Reynolds), 469
Determination of Adrenocortical Steroids and their Metabolites (Proceedings of a Conference held by the Society for Endocrinology, edited by P. Eckstein and S. Zuckerman), *review* by Dr. N. R. Lawrie, 52
Determination of Ascorbic Acid in the presence of Sulphydryl Compounds : Use of *p* Chloromercuribenzoic Acid in the (J. A. Owen, B. Iggo and D. B. Horn), 701
Determination of Calcium and Magnesium in the Hæmolymph of Insects : A Simple Microtitration Method for the (Dr. K. van Asperen and Ida van Esch), 927
Determination of Chlorine in Sea Water : A Chainomatic Pycnometer for the (D. J. Rochford), 641
Determination of Crystal Structures (Dr. H. Lipson and Dr. W. Cochran), *review* by Dr. D. Rogers, 943
Determination of the Gamma Isomer of Benzene Hexachloride in Cattle Dips : A Polarographic Method for the (G. W. Walker), 44
Determination of Lactic Acid in Cultures of Lactobacilli (Dr. A. John G. Barnett), 649
Determination of the Origin of Opium by means of the Composition of the Ash (J. C. Bartlet and C. G. Farmilo), 407
Determination of the Sex Ratio of a Plant Parasitic Nematode : Environmental (Dr. C. Ellenby), 1016
Determination of Sodium, Potassium, Calcium, Magnesium and Strontium by a New Multichannel Flame-Spectrometer : Simultaneous (Dr. Bert L. Vallee), 1050
Determination of Sour Orange Rootstock by Paper Chromatography (Prof Raymond M. Selle), 140
Determining the Thermal Energy of Radiation : Callendar's 'Radio-Balance' for (W. B. Mann), 634
Dethier, V. G. : Odour Research, 303
Detonative Behaviour of Cast Trinitrotoluene : Influence of 'Surface Chilling' on the (T. C. Tranter), 81
Detoxification of Diphtheria Toxin with Formaldehyde mixed with an Amino-acid (Carola Neumuller), 405
Deuterium in Thames River Water : Determination of the Absolute Concentration of (G. Clarke, W. H. Denton and P. Reynolds), 469
Development : Industrial Research and, in the United States, 26
  Scientific Research and, in American Industry (Bulletin No. 1148 of the Bureau of Labor Statistics, United States Department of Labor), 26
Development in Aids for Sub-normal Vision : A New (J. Lederer), 977
Development in Aluminium : Research and—Banbury Laboratories of Aluminium Laboratories, Ltd., 254
Development of Atomic Energy in Britain, 473
Development of Canada during the Past Few Decades (Dr. C. J. Mackenzie), 206
Development of Higher Technological Education : Report on the (Association of Principals of Technical Institutions and Association of Technical Institutions), 325
Development of the Livestock Industries of the Commonwealth : John Anderson Gilruth—the Influence of his Life and Work on the (Sir Ian Clunies-Ross), 1131
Development of Logical and Mathematical Concepts—Piaget's Recent Psychological Studies (Dr. W. Mays), 625
Development of the Nervous System : Chemistry in relation to the (Mental Health Research Fund first International Neurochemical Symposium), 455
Development of Pain-producing Substance in Human Plasma (Desiree Armstrong, Prof. C. A. Keele, Dr. J. B. Jepson and J. W. Stewart), 791
Development of Tolerance to Ganglion Blockade by Methonium Compounds (Dr. J. K. Mohanty), 184
Development and Relational Balance of X-Chromosomes in *Drosophila melanogaster* : Stability in (G. Tebb and Dr. J. M. Thoday), 1109
Development and Utilization of Water Resources (Report of the United Nations Economic and Social Council), 213
Development and Welfare in the British Colonies : Report for 1953–54, 387
Developments in Nuclear Physics : Recent (Sir John Cockcroft), 438
Devons, Prof. S. : Nuclear and Meson Physics, 531
Devonshire, Dr. A. : Ferroelectric Properties of Single Crystals, 1092
Dew, G. D. : Awarded a Bowen Prize for 1953 by the Institute of Physics, 208
Dexter Cattle Crosses (South Devon ×) : Maternal Effect on Birth Weight in (D. M. Joubert and Dr. John Hammond), 647
Dialogue Concerning the Two Chief World Systems—Ptolemaic and Copernican (Galileo Galilei), translated by Stillman Drake, *review* by Prof. E. N. da C. Andrade, 420
2 : 4-Diaminopteridines as Folinic Acid Antagonists : Some (Dr. H. O. J. Collier and Margaret Phillips), 180
Diamond : The Problem of the Two Types of (Prof. G. B. B. M. Sutherland, D. E. Blackwell and W. G. Simeral), 901
Diamond Tool Industry in 1953 (Industrial Diamond Information Bureau), 431
Diamonds : Artificial and Natural Coloration of (R. A. Dugdale), 120
Diapause : The Sorghum Midge (T. Passlow), 656
Diaz-Cadaveco, R. (Fuente, Gertrudis de la, and) : Cocarboxylasic Activity of Thiamine Phosphoric Esters, 1014
2 : 4-Dichlorophenoxyacetic Acid in Plants : Correlation between Endogenous Auxin and its Destruction *in vivo* by (James H. M. Henderson and Dawson C. Deese), 967
Dick, Dr. G. W. A. : Appointed to the chair of bacteriology at Queen's University, Belfast, 253, 383 ; work of, 383
Dick, J. B. : Physiological Aspects of the Heating and Ventilation of Houses in Britain, 578
Dick, W. E. : Science and the Press, 848
Dickson, R. C. M. : Honorary Fellowship of Heriot-Watt College, Edinburgh, conferred on, 164
Dictionary of Organic Compounds (edited by Sir Ian Heilbron and H. M. Bunbury), Vols. 1–4, new edition, *review* by B. A. Ellis, 374
Didymella lycopersici Kleb. : Internal Infection of Tomato Seed by (Dorothy E. Fisher), 656
Dielectric Increment of Sodium Alginate as a Function of Polyion and Counter-ion Concentration (Dr. Lars-Goran Allgén), 1155
Dielectric Oils : Structure of Breath Deposits on (A. Brin), 468
Dielectric Properties of Tellurite Glasses (J. Ph. Poley), 268
Dietary Vitamin B_{12} : Biological Value of Proteins as influenced by (B. R. Baliga, S. Balakrishnan and Dr. R. Rajagopalan), 35
Diezel, Dr. P. : Chemistry in relation to the Development of the Nervous System, 455
Differential Pressures : Measurement of Small, at Low Absolute Pressures (D. I. Gaffee and A. G. Monroe), 756
Differential Refractometer : A Modified (Dr. F. Korosy), 269
Differential Thermal Analysis : Comparative Performance of Nickel and Porous Alumina Sample Holders for (T. L. Webb), 686 ; (Dr. Robert C. Mackenzie), 688
Differential Thermal Studies of some Indian Montmorillonites : X-Ray and (A. K. Bose and Purnima Sengupta), 40
Differential Thermogravimetry (Prof. L. Erdey, F. Paulik and J. Paulik), 885
Differentiation of some Chick Neurons isolated in Chorion-Allantoic Grafts : Autonomous (Prof. Alberto Stefanelli), 974
Differentiation of Growing and Non-Growing Bacteria by a Staining Technique (H. E. Wade and D. M. Morgan), 920, *erratum*, 1087
Diffraction (Electron) : Adsorption of Alkyl Xanthate and Dithiophosphate on a Cleavage Face of Galena as revealed by (Hitoshi Hagihara and Hajime Uchikoshi), 80
Diffraction Diagrams of Cellulose Microfibrils in *Valonia* : Electron (Prof. R. D. Preston and G. W. Ripley), 76
Diffusion Cathode : A New Type of (A. H. Beck, A. B. Cutting, A. D. Brisbane and G. King), 1010
Diffusion and Mass Transport in Tubes (Sir Geoffrey Taylor), 113
Digby, Dr. E. : Social and Individual Significance of Ageing, 684
Digestibility of a Sample of Pasture Grass by Calves (D. G. Armstrong, T. R. Preston and R. H. Armstrong), 1182
Digital Computers : Design and Application of Small (American Institute of Electrical Engineers, the Institute of Radio Engineers and the Association of Computing Machinery fourth Annual Eastern Joint Computer Conference and Exhibition), 432, 681
Dillon, Prof. T. P. : Opening Address at the Summer School in Organic Chemistry of the Institute of Chemistry of Ireland, 590
Dimbleby, Dr. G. W. : The Interactions between Acid Soils and Forest Trees, 855
Dimensionen : Die Welt der ungewohnten (Prof. Arnold Hildesheimer), *review* by Heinz Von Foerster, 284
Dimensions in Physics : Use of, *review* by Dr. H. Lipson, 330
Dimond, Dr. A. E., and Horsfall, Dr. J. G. : Crop Protection, 769
Dingle, Prof. H. : The Sources of Eddington's Philosophy (Eddington Lecture for 1954), 727
Dinitrophenylation of α-, β- and ω-Amino-acids with Sanger's Reagent : Polymerization Reactions occurring during (D. Heikens, Dr. P. H. Hermans and P. F. van Velden), 1187
2,4-Dinitrophenylhydrazones (Keto-acid) : Identification of an Artefact on Chromatograms of the (G. H. N. Towers and D. C. Mortimer), 1189
Diphtheria Toxin : Detoxification of, with Formaldehyde mixed with an Amino-acid (Carola Neumüller), 405
  Submerged Culture Production of (F. V. Linggood, A. C. Matthews, S. Pinfield, C. G. Pope and T. R. Sharland), 557
Diphtheria Toxin within the Cells of *C. diphtheriae* : Potent (Shoki Nishida), 970
Diplopods : Presence of a Peritrophic Membrane in (Mrs. Betty Mason and Owen Gilbert), 1022
Diprose, K. V. : Promoted to Senior Principal Scientific Officer in the Scientific Civil Service, 999 ; work of, 999
Dips (Cattle) : A Polarographic Method for the Determination of the Gamma Isomer of Benzene Hexachloride in (G. W. Walker), 44
Dirac, Prof. P. A. M. : Granted leave of absence by the University of Cambridge, 1087
Direct Microscopy for Study and Count of Soil Protozoa (Y. T. Tchan and J. S. Bunt), 656
Direct Observation of Hapten–Antibody Equilibria (Paul Doty and Samuel I. Epstein), 89
Direction of Travel of Sea Waves : Finding the (N. F. Barber), 1048
Directors of Research Associations, Committee of : Election of Dr. S. Whitehead as chairman, 20
Directory of International Scientific Organizations (Unesco), 489
Discharge (Gaseous) : Use of a, as an Identifiable Radar Target (G. W. G. Court), 367
Discharge of Gametangia from a Brown Alga by a Change from Light to Darkness : Stimulation of the (Dr. Lionel Jaffe), 743
Discovery : June 1954 issue, 66
Discovery (Scientific) : The Organization of (Prof. P. M. S. Blackett), 164
Discovery Reports : Vol. 27, Siphonophora of the Indian Ocean (A. K. Totton), 501

Discrete Sources : Radio Observations of Ionized Hydrogen Nebulæ and other, at a Wave-length of 9·4 cm. (F. T. Haddock, C. H. Mayer and R. M. Sloanaker), 176
Disease (Infectious) : A Statistical Method of Estimating the Periods of Incubation and Infection of an (Norman T. J. Bailey), 139
Disease Epidemic in Fish (H. Affleck), 615
Disease Resistance : Adventitious-Root Formation by Fungal Pathogen Metabolites as a Possible Mechanism of (Prof. M. A. Mostafa), 86
Diseases : Soil-borne Pests and (Association of Applied Biologists Symposium on), 768
Diseases (Plant)   Forecasting and Assessment of (Association of Applied Biologists Symposium on), 769
Diseases of Conifers in New Zealand . Insects and the (G B. Rawlings), 1087
Diseases and Pests on Horticultural Planting Material (P. Aitkenhead and Dr. J. A. Tomlinson), 163
Disintegrative Effect of Skatole : A Remarkable, upon certain Rumen Ciliate Protozoa (J. Margaret Eadie and Dr. A. E. Oxford), 973
Dislocations in Crystals : Mechanical Effects of (Conference at the University of Birmingham), 377
Disorders of the Alimentary Tract and their Nutritional Effects (Scottish Group of the Nutrition Society Symposium on), 492, 1090
Dispersal of *Phytophthora palmivora* Sporangia . Use of Ultra-violet Fluorescent Substances for Observations on (C. A. Thorold), 409
Displacement of Ions in an Ionic Lattice   A Mechanism for the (J. H. O. Varley), 886
Dissent : Freedom, Loyalty, (Prof. Henry Steele Commager), *review* by R. Brightman, 942
  The Right to, *review* by R. Brightman, 942
Distances of Nebulæ : The Law of Red Shifts and the (the late Dr. Edwin Hubble), 1046
Distillation (F. T. Riley), 591
Distillation (Vacuum) . Concentration of Potato Root Diffusate by (N. G. Hague), 1018
Distribution of the Dental Fricatives in Europe . The *O* Chromosomes and the (R W. Thompson), 1095
Distribution of Histamine : Intracellular (Dr. I. Mota, W. T. Beraldo, A. G. Ferri and L. C. U. Junqueira), 698
Distribution of Minor Elements in Rocks (British Association for the Advancement of Science, Section C (Geology), Discussion on), 811
Distribution of Organic Components of Bone   Longitudinal (G. Curzon), 646
Disulphide : A New Mixed—Penicillamine-Cysteine (Milton Tabachnick, Herman N. Eisen and Bernard Levine), 701
Dithiophosphate . Adsorption of Alkyl Xanthate as, on a Cleavage Face of Galena as revealed by Electron Diffraction (Hitosi Hagihara and Hajime Uchikoshi), 80
Diversity of Scientific Advances (Dr. E. D. Adrian), 1032
Division of Amphibian Eggs : Influence of Ribonuclease on the (L. Ledoux, J Le Clerc and F. Vanderhaeghe), 793
Dix, Dr. R. M. : Localization of Function in the Cerebral Cortex, 720
Dobriner, Konrad, and others : Infrared Absorption Spectra of Steroids, *review* by Dr. A. E. Martin, 945
Dobrowolski, Prof. A. B.   Reference to the obituary notice of (G Seligman), 20
Dobry, Alan, and Mähncke, Henry E. : Reaction of Stearic Acid Monolayers with Copper and Cuprous Oxide, 507
Dobzhansky, Prof. Th. (Gartler, Stanley, and) : Excretion in Human Urine of an Unknown Amino-acid derived from Dates, 553
Dodd, Dr. J. M. : Comparative Endocrinology of Vertebrates, 543
  Hormones and Control of Zoological Function, 721
Dodds, Dr. J. M., and Beck, A. H. . New Forms of Thermionic Cathode, 1176
Dodgson, Dr. K. S., and others : Isolation and Characterization of Biosynthetic Arylsulphates, 599
Doeksen, Dr. J. : Soil-borne Pests and Diseases, 768
Dog and Cat : Lingual Proprioception in Pig, (Mary E. Law), 1107
Dogs : Heparin and Histamine in Mast-Cell Tumours from (Rosemary Cass, J F. Riley, Dr. G. B. West, K. W. Head and S. W. Stroud), 318
Doherty, Rev. W. L. : *Obituary* of Dr. R. S Clay, 16
Dolichos biflorus and *Phaseolus lunatus* : A Further Serological Distinction between the Hæmagglutinins of (Lieut.-Colonel G. W. G. Bird), 1015
Dollin, F : Factors Influencing the Continuing Development of the Steam Turbine (Parsons Memorial Lecture of the Institution of Mechanical Engineers), 681
Domb, Dr. Cyril : Appointed to the University of London chair of theoretical physics at King's College, 112, 250 ; work of, 250
Domestic Buffalo . Sweating Mechanism in the (Dr. E. S. E. Hafez and M. M. Shafei), 1181
Domestic Fowl : Neurohypophysial Control of Follicular Maturation in the (R. M. Fraps and M. H. Conner), 1148
Dominion Museum, Wellington   Records, Vol. 2, Part 1, 490
Domville, V. T.   Appointed a senior agricultural officer, Jamaica, 209
Donahue, Dr Wilma   Social and Individual Significance of Ageing, 684
Donald, Prof. M. B.   *Obituary* of Hugh Griffiths, 339
Donatien, Dr. André . *Death* of, 589
Done, J. (Payne, P. R., and) : Assay of Tritium-labelled Substances—a 'Combustion Bomb' Method of Preparation of Gas for Counting, 27
Donovan, B. T., and Harris, Prof. G. W. : Effect of Pituitary Stalk Section on Light-induced Œstrus in the Ferret, 503
Doolittle, Arthur K. : Liquid-State Equation for Normal Paraffins, 369
Dorsiventrality in Leaves : Experiments on the Cause of (I. M. Sussex), 351 ; (R. Snow and Mary Snow), 352
Doty, Paul, and Epstein, Samuel I. : Direct Observation of Hapten–Antibody Equilibria, 89
Doubling of Spectral Lines : Unusual (Rev. J. Junkes and Rev. E. W. Salpeter), 138
Douglas, Dr. C. G. : Physiological Aspects of the Heating and Ventilation of Houses in Britain, 578
Douglas, Dr. G. P. : *Obituary* by Miss F. B. Bradfield, 952
Dowling, Dr. John J. : Sensitive Parallax Detector for Optical Bench, 465
Dowson, Dr. D. : Appointed lecturer in the Department of Mechanical Engineering, University of Leeds, 863
Dowson, G. : Appointed agricultural officer, Sarawak, 821
Doyle, Dr. A. E., and others : Mechanism of Hypotensive Action of Reserpine, an Alkaloid of *Rauwolfia serpentina*, 1015
Dragonflies (British) . Seasonal Regulation in (Philip S. Corbet), 655, *erratum*, 777
Dresel, Dr. E. I. B., and Tooth, Miss B. E. : Solubility of Uroporphyrin I in Ethyl Acetate, 271
Drewery, J. : Appointed lecturer in psychology at Queen's University, Belfast, 67
Dreyer, J. L. E. : New General Catalogue of Nebulæ and Clusters of Stars, 634
Dreyer, Prof. T. F. : *Obituary* by Prof. A. J. D. Meiring, 485 ; obituary by L. H. Wells, 486
Dreyfus Prize for 1954 awarded to Dr. Hans Kalmus, 636
Drogin, Dr. I. : Theory and Practice of Compounding Rubber, 169
Droop, M. R. : Cobalamin Requirement in Chrysophyceae, 520
Droplets : Production of Individual, Sized, by High-Voltage 'Firing' from a Micropipette (H. A. Druett and K. R. May), 467
Drosophila . Fluorescent Substances in Chromatograms of a Mutant Stock of (Dr. Elisabeth Goldschmidt), 883
Drosophila melanogaster : Stability in Development and Relational Balance of X-Chromosomes in (G. Tebb and Dr. J. M. Thoday), 1109
Drosophila subobscura Collin . Dawn and Dusk Flight of (L. R. Taylor and Dr. H. Kalmus), 221
Druett, H. A., and May, K. R. : Production of Individual, Sized, Droplets by High-Voltage 'Firing' from a Micropipette, 467
Drummond, J. W   Appointed agricultural officer, Nyasaland, 864
Drummond Fellowship in Nutrition awarded to Dr. Iain MacIntyre, 386
Drummond Fellowship for 1955 for Research in Nutrition, 955
Drumtochty Forest (Forestry Commission Booklet), 391
Drying : Biological Applications of Freezing and (edited by R. J. C. Harris), *review* by Dr. S. T. Cowan, 850
Drying of Biological Cultures, 349
Drying Biological Material   Freezing and, *review* by Dr S. T. Cowan, 850
du Toit, Dr. Alex. L.   The Geology of South Africa (edited and prepared for publication by Dr. S. H. Haughton), third edition, *review*, 945
Ducker, Sophie C. (McLennan, Dr. Ethel I., and) : Micro-fungal Population of Acid Sandy Podsols, 1060
Duckham, A. N. . Appointed to the chair of agriculture in the University of Reading, 428 ; work of, 428
Duckworth, Prof Henry E : Atomic Weights of the Monoisotopic Elements, 595
Duddell Lecture of the Physical Society (Prof. A. C. B. Lovell), 164
Dudenbostel, B. F. : Molecular Spectroscopy, 1165
Dudley, B. R.   Resignation as lecturer in applied mathematics at the University of Sheffield, 820
Dugdale, R. A. : Artificial and Natural Coloration of Diamonds, 120
Dujardin, R. A.   Appointed geologist, British Guiana, 864
Dujarric de la Rivière, Dr. R. : et Eyquem, Dr. A.   Les groupes sanguins chez les animaux, *review* by Dr. A. E. Mourant, 898
Duncan, D. C. (Handyside, J. D., and) : Selection of Supervisors, 330
Duncan, Prof. W J. : Basic Dynamics for Students of Aeronautics, *review*, 1073
Duncanson, Sir John   Appointed a member of the National Research Development Corporation for a further period, 20
Dunlop Rubber Co., Ltd. : Gift of £450 a year for seven years to the Department of Textile Industries, University of Leeds, for a research scholarship, 863
Dunn, D. B., and Smith, Dr. J. D.   Incorporation of Halogenated Pyrimidines into the Deoxyribonucleic Acids of *Bacterium coli* and its Bacteriophages, 305
Dunn, Dr. Diana Rowan, and White, Prof. E. G. . Lungworms (*Metastrongylus* spp) in Pigs, and their Development in the Guinea Pig, 1193
Dupouy, Prof. G., and Fert, Prof. Ch. : Electron Optics, 825
Durand, M. R. E. : Appointed veterinary officer, Kenya, 492
Dushman, Dr. Saul : *Obituary* by Prof. P. A. Vick, 381
Dusk Flight of *Drosophila subobscura* Collin : Dawn and (L. R. Taylor and Dr. H. Kalmus), 221
Dussart, B. .   Biological, Physical and Chemical Characteristics of the Profundal Zone of Lakes, 1136
Dutch-Norwegian Joint Establishment for Nuclear Energy Research : Report for the Year 1952–53, 258
Dutta, Prof. A. K., and Samal, K.   Ultrasonic Absorption in Castor Oil, Carbon Disulphide, Benzene and Xylene, 976
Dyers and Colourists, Society of : Election of Fred Smith as president, 113
  Perkin Medal awarded to Dr. Arthur Zitscher, 636
Dyes (Fluorescent) : Localization of Embryonic Antigens by Antisera labelled with (Mrs. R. M. Clayton), 1059
Dyes (Phthalein) : Reaction between, and Heated Foodstuffs (Allan Frolich), 879
Dynamic Aspects of Biochemistry (Prof. Ernest Baldwin), second edition, *review* by Prof. J. N. Davidson, 764
Dynamics (Aeronautical) : Introduction to (Prof. Manfred Rauscher), *review* by Prof. W. J. Duncan, 1073
Dynamics for Students of Aeronautics . Basic, *review* by Prof. W. J. Duncan, 1073
Dyson, Prof. F. J. : Nuclear and Meson Physics, 531

E IONIZATION of the Ionosphere . Thunderstorms and Sporadic (Prof. S. K. Mitra and M. R. Kundu), 798
Eadie, J. Margaret, and Oxford, Dr. A. E. : A Remarkable Disintegrative Effect of Skatole upon certain Rumen Ciliate Protozoa, 973
Eames, Dr. A. J. : Plant Genera, 71
Earland, Christopher, and Raven, David J. : A New Solvent for Silk, 461
Earliest Sign of a Sensory-Motor Reaction . Antagonist Inhibition as the (H.-J. Hufschmidt and Tamara Hufschmidt), 607
Earth : The Limits of the (Fairfield Osborn), *review* by Prof. L. Dudley Stamp, 422
  Perturbing Action of the, on Meteor Streams (L. Kresák), 826
Earth (Tropical Black) : *In vitro* Production of (Dr. D. G. Hessayon and R. G. Hutton), 612
Earth's Climate : The Ice Ages and Past Variations of the, 172

Earth's Outer Core . Composition of the (Prof. K. E. Bullen), 505
Earthquake near Orléansville, Algeria, 538
Earthquake of July 21, 1952, and its After-shocks : An Engineering Study of the Southern Californian (Karl V. Steinbrugge and Donald F. Moran), 909
Earthquakes during March, 66 ; during April, 112
East Africa : Experiments on Artificial Stimulation of Rain in (D. A. Davies), 256
East Africa High Commission : Appointment of Miss E. R. Blydenstein as meteorologist, 344
  Annual Report for 1953 of the East African Industrial Research Board, 430
  Appointment of R. D. Brown as veterinary research officer (virologist), 821
  Appointment of M. C. Williams as medical research officer, grade 3, 821
  Annual Report for 1953, 823
East African Industrial Research Board : Annual Report for 1953, 430
East African Malaria Unit : Appointment of T. E Fletcher as scientific officer (chemist), 821
East African Territories (British) : Economic Survey of the (A. J. Hunt), 114
East American Species of Crabs in European Waters : Occurrence of Two (Torben Wolff), 188
Easterfield, Dr. T. E. . Pitfalls in the Collection of Data from Firms, 500
Eastern Joint Computer Conference and Exhibition . Fourth Annual (American Institute of Electrical Engineers, the Institute of Radio Engineers and the Association of Computing Machinery), 432, 681
Eastman, George (1854–1932), 64
Eastoe, J. E., and Kenchington, A. W. : Ion-Exchange Chromatography of Guanidino Amino-acids from Synthetically Modified Gelatin, 966
Eayrs, Dr. J. T. · Chemistry in relation to the Development of the Nervous System, 457
Eccles, J. ; Power Resources of the World, 1000
Ecdysis : The Second, of Infective Nematode Larvae (R. I. Sommerville), 751
Eckstein, Mrs. B. : Resignation as lecturer in geography at the University of Birmingham, 820
Eckstein, P. : Comparative Endocrinology of Vertebrates, 543
Eckstein, P., and Zuckerman, S. (edited by) · The Determination of Adrenocortical Steroids and their Metabolites (Proceedings of a Conference held by the Society for Endocrinology), *review* by Dr. N. R. Lawrie, 52
Eclipse of February 25, 1952 (Solar) : The Ionosphere during the (C. M. Minnis), 1137
Eclipse of June 30 (Total Solar) : British Expeditions' Results (Prof. R. O. Redman), 247
  Magnetic Observations at Quetta during the (S. A. A. Kazmi), 706
Ecological 'Niche' : A Curious, among the Fishes of Lake Tanganyika (Dr. G. Marlier and N. Leleup), 935
Ecology : Research Studentships in (Nature Conservancy Awards), 727
Ecology (Small-Mammal) : Use of Radioactive Isotopes in (Gillian K. Godfrey (Mrs. Crowcroft)), 961
Economic Survey of the British East African Territories (A. J. Hunt), 114
Economic Systems : Automatic Control for, *review* by Prof. G. L. S. Shackle, 421
  The Mechanism of (Prof. Arnold Tustin), *review* by Prof. G. L. S. Shackle, 421
Economy (British) : The Changing Structure of the (Prof. E. A. G. Robinson), 440
Eddington Lecture for 1954 (Prof. H. Dingle), 727
Eddington's Philosophy : The Sources of (Prof. H. Dingle), 727
Eddington's Theory · Recession of the Galaxies in (Dr. N. B. Slater), 321
Eden, A. (Thomas, G., and) : A Peculiar Nutritional Dermatitis in Pigs, 553
Eden, Dr. T. : Morphological Basis of Quality in Tea, 844
Edge, R. D. : Appointed a Research Fellow in the School of Physical Sciences of the Australian National University, Canberra, 67
Edinburgh, H.R.H. the Duke of · Science in New Zealand, 678
  To open the new laboratories at Shawbury of the Research Association of British Rubber Manufacturers, 910
  Informal Visit to the Fulmer Research Institute, Stoke Poges, 1167
Edington, Dr. G. M. · Appointed special pathologist, Gold Coast, 864
Edison Swan Electric Co., Ltd. · Educational Booklet on Electrons, 432
Edlén, Prof. B. : Atomic Line Spectra, 729
Edlund, T. : Protective Effect of *d,l-α*-Octadecylglycerolether in Mice given Total Body X-Irradiation, 1102
Edström, Jan-Erik, and Hydén, Holger : Ribonucleotide Analysis of Individual Nerve Cells, 128
Education · Adult—Why this Apathy ? (Dr. Ernest Green), 524
  Adult, in Great Britain, 523
  Adult, in Great Britain (Report of the Ashby Committee), 865
  Higher Technological (Parliamentary and Scientific Committee Memorandum on), 372
  Higher Technological, in Great Britain (R. A. Butler), 111
  Higher Technological, in Great Britain, 251
  The Place of Biology in a General University (Institute of Biology and the University College of North Staffordshire Residential Conference on), 777
  Technological and Technical, in Britain, 325
Education (Adult) · The Organization and Finance of, in England and Wales (Ministry of Education), 865
Education (Higher Technological) · Report on the Development of (Association of Principals of Technical Institutions and Association of Technical Institutions), 325
Education (Modern) . The History of Science in (Dr. H. Hamshaw Thomas), 481
Education, Ministry of : The Organization and Finance of Adult Education in England and Wales, 865
Education (Higher Technological), London and Home Counties Regional Advisory Council for ; Publication No. 18, Applied Research in Technical Colleges, 913
Education Scheme of the Institute of Fuel : New (Dr. D. T. A. Townend), 489
Education and Extension Services in Applied Biology (Association of Applied Biologists Symposium on), 768
Education and Training in the field of Management (British Institute of Management Booklet on), 432
Edward VI (King) Grammar School, Camp Hill, Birmingham (Natural History Society of) : Brown's Coppice, a Survey, 686
Edwards, R. G.: Colchicine-induced Heteroploidy in Early Mouse Embryos, 276
Efficiency of Oxidative Phosphorylation (Prof. Henry Lardy and J. H. Copenhaver, Jun.), 231
Effluents : Biological Evaluation of Water and (Biological Methods Group of the Society for Analytical Chemistry Symposium on), 1042
Egg Production in Starved Milkweed Bugs : Corpus allatum and (A. S. Johansson), 89
Egg-laying in Ctenophora (A. K. Totton), 360
Eggleton, Dr. M. Grace · Title of reader in physiology in the University of London conferred on, 1040
Eggleton, Dr. Philip : Obituary by Prof. G. F. Marrian, 952
Eggs (Amphibian) : Influence of Ribonuclease on the Division of (L. Ledoux, J. Le Clerc and F. Vanderhaeghe), 793
Eggs (British Birds') : The Observer's Book of (compiled by G. Evans), *review* by Bruce Coleman, 480
Egloff, Gustav : Physical Constants of Hydrocarbons, Vol. 5, Paraffins, Olefins, Acetylenes and other Aliphatic Hydrocarbons, *review* by Dr. E. F. G. Herington, 1164
Egner, W. E., and Young, A. : Staffing of Grammar Schools, 208
Einstein, Prof. Albert : Scientific Convocation under the auspices of the Hebrew University of Jerusalem, the Technion, Haifa, the Weizmann Institute of Science, Rehovot, and the Research Council of Israel, in celebration of the seventy-fifth birthday of, 591
Eisen, Herman N., and others : A New Mixed Disulphide—Penicillamine–Cysteine, 701
Ejby-Poulsen, P. : Hæmolytic Anæmia produced Experimentally in the Guinea Pig by *T*-transformation of the Erythrocytes *in vivo* with Purified Concentrated Enzyme, 929
Elastic Fibres : Staining Reactions of, with special reference to 'Elastotic Degenerations' in the Human Skin (Prof. Theodore Gillman, Jack Penn, Doris Bronks and Marie Roux), 789
Elastic Scattering · Direction of Polarization of Proton Spin produced by (L. Marshall and J. Marshall), 1184
Elasticity : Some Basic Problems of the Mathematical Theory of (N. I. Muskhelishvili), translated from the Russian by J. R. M. Radok, third edition, *review* by Prof R. Hill, 713
  A Landmark in the Theory of, *review* by Prof. R. Hill, 713
Elastin in the Adult Rat · Metabolism of (H. G. B. Slack), 512
'Elastotic Degenerations' in the Human Skin · Staining Reactions of Elastic Fibres with special reference to (Prof. Theodore Gillman, Jack Penn, Doris Bronks and Marie Roux), 789
Elbert, Prof. S. H., and Spoehr, Dr. Alexander : Linguistic Studies in Polynesia, 471
Elcoate, P. V., and others : Influence of Ethylenediamine-tetra-acetic Acid on the Excretion of Zinc by the Rat, 881
Electric Fields produced by Growing Roots · A New Approach to the Study of (Prof. A. L. McAulay and B. I. H. Scott), 924
Electric Power · Production of, by mixing Fresh and Salt Water in the Hydroelectric Pile (R. E. Pattle), 660
Electrical Breakdown Strength of Air at Low Pressure in the Region of 300 Mc./s. . Artificial Increase of (G. W. E. Stark and G. L. Fougere), 1066
Electrical Engineers, Institution of : Jubilee of the application by Sir Ambrose Fleming for the British Patent of his thermionic valve, 386
  Presidential Address (J. Eccles), 1000
  Jubilee Celebration of the Invention of the Thermionic Valve, 1076
Electrical Forces between Charged Colloid Particles : Short-range (Dr. D. M. C. MacEwan), 39
Electrical Machines and Transformers, *review* by R. Neumann, 988
Electrical Measurements : Precision (Symposium at the National Physical Laboratory), 910
Electrical Potential Analyser for the Solution of the Problem of the Determination of the Torsion Constants for Bulbs and Fillets (P. J. Palmer), 253
Electrical Research Association : Network Analyser of the, 214
Electrical Systems : Aircraft (Vacation School at the Imperial College of Science and Technology), 67, 1001
Electrical and Allied Industries Research Association, British : Annual Report for 1953, 592
Electricity : Gas and (Research in British Power Industries), 996
Electrode Potentials · Measurement of, in Living and Dead Tissues (Dr. D. B. Cater and Dr. A F. Phillips), 121
Electrolyte Concentrations in Red Blood Cells of British Breeds of Sheep (John V. Evans), 931
Electro-Magnetic Machines (Prof. R. Langlois-Berthelot), translated and revised in collaboration with Lieut.-Colonel H. M. Clarke, *review* by R. Neumann, 988
Electromagnetic Radiation : T. K. Sidey Summer-time Award for Research on (Royal Society of New Zealand), 955
Electron Diffraction : Adsorption of Alkyl Xanthate and Dithiophosphate on a Cleavage Face of Galena as revealed by (Hitosi Hagihara and Hajime Uchikoshi), 80
Electron Diffraction Diagrams of Cellulose Microfibrils in *Valonia* (Prof. R. D. Preston and G. W. Ripley), 76
Electron Irradiation of Polythene (A. C. Baskett and C. W. Miller), 364
Electron Microscopy · Introduction to (Prof. Cecil E. Hall), *review* by Dr. V. E. Cosslett, 898
  International Conference on, London, 1954 (Dr. C. E. Challice), 824
  1950 International Congress of, *review* by Dr. V. E. Cosslett, 330
Electron Microscopy as a Text-Book Subject, *review* by Dr. V. E. Cosslett, 898
Electron Pulses : Velocity of (L. L. Whyte, D. L. Richards and Dr. D. Gabor), 398, 681
Electron-Track Autoradiography of Radioactive Frog Embryos (Frederick Sperling), 749
Electronegativity and the Stability of Metal Complexes (Dr. D. Chapman), 887
Electronic Band Structure of Solids (Radar Research Establishment Conference on), 949
Electronics : Advances in (edited by L. Marton), Vol. 5, *review* by Dr. L. Jacob, 287

Electronics : Communications and, 724
Electronics, Institution of (North-West Branch) : Exhibition in Manchester (Dr. A. W. Hanson), 345
Electronics Course at Harwell : Ninth (Atomic Energy Research Establishment), 298
Electronics at Work (Scientific Instrument Manufacturers' Association Exhibition), 636
Electrons (Edison Swan Electric Co., Ltd., Educational Booklet on), 432
Electrophoresis (Paper) : Detection of Carbohydrates in (L. R. Wetter and June J. Corrigal), 695
Electrophoresis (Zone) : Fractionation of Serum Proteins by, in Glass Powder (C. J. Bradish and Nan V. Smart), 272
Electrophoresis of Human Red-Cell Stroma (T. A. J. Prankerd, Dr. K. I. Altman and J. R. Anderson), 1146
Electrophoresis of *Strychnos* Alkaloids : Paper (Prof. G. B. Marini-Bettòlo and Dr. M. Lederer), 133
Electrophoretic Behaviour of Steroid-Detergent Mixtures in Aqueous Buffers : Solubility and (Dr. Otto J. Schmid and Dr. Klaus D. Voigt), 129
Electrophoretic Migration of Contents of Intact Liver Nuclei (J. St. L. Philpot and J. E. Stanier), 651
Electrophoretic Movement of Higher Fatty Acids on Filter Paper (Dr. A. John G. Barnett and D. K. Smith), 659
Electrophoretic Technique : Recent Advances in (Dr. E. F. McCarthy), 591
Electroretinal Photopic Sensitivity Curves (Dr. E. P. Johnson and T. N. Cornsweet), 614
Elements : A New Periodic Table of the, based on the Structure of the Atom (Dr. S. I. Tomkeieff), *review* by Prof. F. A. Paneth, 420
Elements 97, 98, 99 and 100 : Spontaneous Fission Properties of (P. R. Fields, M. H. Studier, L. B. Magnusson and J. R. Huizenga), 265
Elements (Minor) : Distribution of, in Rocks (British Association for the Advancement of Science, Section C (Geology), Discussion on), 811
Elements (Monoisotopic) : Atomic Weights of the (Prof. Henry E. Duckworth), 595
Elements in Rocks : Frequency Distribution of the Concentrations of (K. V. Aubrey), 141
Elkes, Prof. J. : Chemistry in relation to the Development of the Nervous System, 456

Ellis, Sir Charles : Smokeless Fuels, 1130
Ellis, F. : Rheology in Mechanical Engineering, 202
Ellis, R. T. : Tolerance to the Maize Rust *Puccinia polysora* Underw., 1021
Elsevier's Encyclopaedia of Organic Chemistry (edited by F. Radt), Series 3, Carboisocyclic Condensed Compounds, Vol. 12B, Naphthalene (A), Compounds containing One Naphthalene Nucleus, Naphthoic Acids and their Halogen, Nitrogen and Hydroxyl Derivatives, *review* by Dr. J. W. Cook, 1073
Elster, H. J. : Biological, Physical and Chemical Characteristics of the Profundal Zone of Lakes, 1136
Embryo (Newt) : Nuclear Uptake of Glycine-2-^{14}C in the (J. L. Sirlin and Prof. C. H. Waddington), 309
Embryonic Antigens : Localization of, by Antisera labelled with Fluorescent Dyes (Mrs. R. M. Clayton), 1059
Embryos (Chick) : Infection of Chickens and, with the Viruses of Foot-and-Mouth Disease and of Vesicular Stomatitis (H. H. Skinner), 1052
Embryos (Early Mouse) : Colchicine-induced Heteroploidy in (R. G. Edwards), 276
Embryos (Mouse) : Independence of Delayed Fertilization and Spontaneous Triploidy in (A. H. Gates and Dr. R. A. Beatty), 356
Embryos (Radioactive Frog) : Electron-Track Autoradiography of (Frederick Sperling), 749
Emery, E. W., and Veall, N. : Radiation Dosimetry of Iodine-132, 889
Emission of Positive Ions from Platinum : Effect of Vapours of Halogen Compounds on the (Prof. Nobuji Sasaki and Masaru Onchi), 84
Emmer Wheat : Chromosomal Biotypes in (Dr. P. N. Bhaduri and P. N. Ghosh), 934
Emperor Moth, *Saturnia pavonia* L. : Factors affecting the Larval Spot Colours of the (D. B. Long), 563
Empire Cotton Growing Corporation : Progress Report for 1952–53 from the Experiment Stations in Northern Nigeria, 726
Emulsions stabilized with Non-Ionic Detergents : Use of Adsorption Columns in the Analysis of (T. Green, R. P. Harker and F. O. Howitt), 659
Enantiomorphs : Enzymatic Conversion of Two Geometrical Isomers into (W. R. Sistrom and R. Y. Stanier), 513
Encephalomyelitis (Canine) : A Virus associated with (James H. Whittem), 359
Endemic Diseases, Bulletin of (Institute of Endemic Diseases, Baghdad), 819
Enders, Prof. John F. : Nobel Prize for Physiology and Medicine for 1954 awarded jointly to Prof. Frederick C. Robbins, Prof. Thomas H. Weller and, 818
Endocrine Mechanism controlling Locust Pigmentation : A Possible (B. Nickerson), 357
Endocrinology (Joint Biology Committee Conference on), 680
Endocrinology, Society for : Memoir No. 2, The Determination of Adrenocortical Steroids and their Metabolites (edited by P. Eckstein and S. Zuckerman), *review* by Dr. N. R. Lawrie, 52
Endocrinology of Vertebrates : Comparative (International Symposium on the), 543
Endogenous Auxin and its Destruction *in vivo* by 2 : 4-Dichlorophenoxyacetic Acid in Plants : Correlation between (James H. M. Henderson and Dawson C. Deese), 967
Energy : Chemical Action of Ionizing Radiations—Excitation of Optical Levels by Particles of Relatively Low (Dr. Joseph Weiss), 78
Energy Spectrum (Planck) : The Maximum of the (R. N. Bracewell), 563
Energy Transfer in Hot Gases (United States National Bureau of Standards, Circular 523), 383
Engine : The Hydrogen (R. O. King and Mogens Rand), 975
Engineering : Industrial—Report of a visit to the U.S.A. in 1953 of a British Specialist Team on Industrial Engineering (British Productivity Council), 893
  Public Health (Peter C. G. Isaac), *review* by H. E. W., 1075
  Relaxation in Physics and, *review* by Prof. G. Temple, 714
Engineering Industry in Britain : Recruitment in the (British Association for the Advancement of Science, Sections G (Engineering) and L (Education), Discussion on), 637
Engineering Progress : Effects of New Materials on (Dr. Willis Jackson), 441
Engineering Structures : Vibration in, *review* by Dr. K. M. Entwistle, 1029
Engineering Study of the Southern Californian Earthquake of July 21, 1952, and its Aftershocks (Karl V. Steinbrugge and Donald F. Moran), 909
Engineers : Writing for, *review* by R. H. Macmillan, 622
Engineers in the United States : Registration of Chemists and, 65
Engineers as Writers (edited by Walter J. Miller and Leo E. A. Saidla), *review* by R. H. Macmillan, 622
England : The Platonic Renaissance in (Prof. Ernst Cassirer), translated by James P. Pettegrove, *review* by F. I. G. Rawlins, 475
England (Rural), Council for the Preservation of : Twenty-eighth Annual Report, 297
England and Wales : New Nature Reserves in, 1088
  The Organization and Finance of Adult Education in (Ministry of Education), 865
Engledow, Sir Frank : Chemicals in Food, 295
English Electric Research Fellowship in Aeronautics awarded to M. E. Filby, 680
Enhancement of Insulin Action by Pituitary Growth Hormone (P. J. Randle), 1053
Entomological Conference : Sixth Commonwealth, 541 ; (Dr. C. H. N. Jackson), 1112, (The Writer of the Article), 1112
Entomology and Public Opinion, 253
Entwicklungs- und Bewegungsphysiologie der Pflanze (Dr. Erwin Bunning), dritte Auflage, *review* by Dr. E. Ashby, 285
Entwistle, Dr. K. M. : Vibration in Engineering Structures, *review*, 1029
Environment : Salmon Migration and the (Prof. A. G. Huntsman), 215
Environment (Natural) : Examination of Soil Micro-organisms in their (Mrs. F. E. S. Alexander and R. M. Jackson), 750
Environmental Control of Coat Changes in Cattle (N. T. M. Yeates), 609
Environmental Determination of the Sex Ratio of a Plant Parasitic Nematode (Dr. C. Ellenby), 1016
Enzymatic Conversion of Salicylhydroxamic Acid to Salicylamide (Prof. Julius Lowenthal), 36
Enzymatic Conversion of Two Geometrical Isomers into Enantiomorphs (W. R. Sistrom and R. Y. Stanier), 513
Enzyme : Haemolytic Anaemia produced Experimentally in the Guinea Pig by *T*-transformation of the Erythrocytes *in vivo* with Purified Concentrated (P. Ejby-Poulsen), 929
Enzyme Formation : Apparent Induced, due to Coenzyme Deficiency (A. A. Hakim and Prof. Frank C. Happold), 358
Enzyme System of Rat Liver : Conversion of Schradan and Parathion by an (A. N. Davison), 1056
Enzymes (Proteolytic) : Separation of, of *Clostridium histolyticum* (Robert DeBellis, Ines Mandl, John D. MacLennan and Edward L. Howes), 1191
Enzymic Decarboxylation of γ-Methyleneglutamic Acid by Plant Extracts (L. Fowden), 208
Enzymic Synthesis of Serine : Participation of Pyridoxal Phosphate in the (R. L. Blakley), 652
Ephedrine on Dark Vision : Effect of (Dr. G. W. Granger), 653
Epidemic in Fish : A Disease (H. Affleck), 615
Epididymis : Glycogen Secretion in the (Dr. Lennart Nicander), 700
Epistatic Factor : Analysis of Unordered Tetrads Segregating for a Lethal or other (Dr. H. L. K. Whitehouse), 463
Epithelial Cell of the Lactating Goat Udder : Synthetic Activity of a Single (K. C. Richardson and Dr. S. J. Folley), 828
Epizootic among Laboratory Stocks of the Desert Locust, *Schistocerca gregaria* Forsk (J. P. Stevenson), 222
Epstein, Samuel I. (Doty, Paul, and) : Direct Observation of Hapten–Antibody Equilibria, 89
Equation for Normal Paraffins : Liquid-State (Arthur K. Doolittle), 369
Equations : Singular Integral (N. I. Muskhelishvili), second edition, *review* by Prof. R. Hill, 713
Equatorial Africa : The Birds of West and (Dr. David Armitage Bannerman), Vol. 1, Struthionidae, to Picidae ; Vol. 2, Eurylaemidae to Ploceidae, *review* by Sir Landsborough Thomson, 5
Equine Ampullar Secretion : Ergothioneine in the (Prof. E. Leone), 404
Eradication of *Venturia inaequalis* (Cooke) Wint. (K. E. Hutton), 1017
Erdey, Prof. L., and others : Differential Thermogravimetry, 885
Ergothioneine in the Equine Ampullar Secretion (Prof. E. Leone), 404
Erlanger, Bernard F., and Goode, Louise : Gramicidin S—Relationship of Cyclic Structure to Antibiotic Activity, 840
Erwood, F. C. Elliston : The Present State of Monastic Archaeology in Kent, 69
Erythrocyte Stroma (Human) : Incorporation of Acetate-2-^{14}C into, as a Function of Storage (Dr. K. I. Altman and Scott N. Swisher), 459
Erythrocytes *in vivo* : Haemolytic Anaemia produced Experimentally in the Guinea Pig by *T*-transformation of the, with Purified Concentrated Enzyme (P. Ejby-Poulsen), 929
Erythromycin : Toxicity of (W. J. Kaipainen and S. Faine), 969
Esch, Ida van (Asperen, Dr. K. van, and) : A Simple Microtitration Method for the Determination of Calcium and Magnesium in the Haemolymph of Insects, 927
E. coli containing 5-Bromouracil in its Deoxyribonucleic Acid (Dr. Stephen Zamenhof and Mrs. Gertrude Griboff), 307
Eshelby, Dr. J. D. : Mechanical Effects of Dislocations in Crystals, 378
Essen, Dr. L., and others : World-wide Frequency and Time Comparisons by means of Radio Transmissions, 922
Essentials of Physiological Chemistry (Prof. Arthur K. Anderson), fourth edition, *review* by Prof. J. N. Davidson, 764
Esso Magazine, Vol. 3, No. 11, 299
Esters (Thiamine Phosphoric) : Cocarboxylasic Activity of (Gertrudis de la Fuente and R. Diaz-Cadavieco), 1014

Estimates, Select Committee on : Fifth Report, Session 1953–54, Agricultural Research, 663, 955
Estimates of Age for some African Minerals (Prof. J. T. Wilson, R. M. Farquhar, P. Gretener, R. D. Russell and H. A. Shillibeer), 1006
Estimation of Germanium : Fluorometric Detection and (N. Appala Raju and Prof. G. Gopala Rao), 470
Estimation of Impurities in Liquid Chlorine by Infra-red Absorption Spectrophotometry (A. M. Pross), 467
Estimation of Oleic and Linoleic Acids in the presence of Straight-chain Saturated Fatty Acids : A Chromatographic Method for the (W. Mary L. Crombie, R. Comber and S. G. Boatman), 181
Estimation of the Survival-Rate of Anopheline Mosquitoes in Nature (G. Davidson), 792
Ethics and Politics : Human Society in (Bertrand Russell), *review* by Prof. T. S. Simey, 1162
Ethnic Groups living in Malaya : Renal Excretion of 17-Ketosteroids by Members of some (Prof. J. W. H. Lugg and Dr. J. M. Bowness), 1147
Ethnobotany of the Gilbert Islands (Prof. Katharine Luomala), 679
Ethnology of Saipan in the Mariana Islands (Alexander Spoehr), 19
Ethology : Some Concepts of (Dr. W. H. Thorpe), 101
8-Ethoxycaffeine : Effect of Oxygen on the Frequency of Chromosome Aberrations produced by (Dr. Bengt Kihlman), 561
Ethyl Acetate : Solubility of Uroporphyrin I in (Dr. E. I. B. Dresel and Miss B. E. Tooth), 271
Ethyl Nitrite : Effect of Nitrogen Dioxide on the Thermal Decomposition of (Dr. F. H. Pollard, A. E. Pedler and C. J. Hardy), 979
Ethylenediamine-tetra-acetic Acid : Influence of, on the Excretion of Zinc by the Rat (M. J. Millar, M. I. Fischer, C. A. Mawson and P. V. Elcoate), 881
Étienne, A., and others : Paramagnetic Resonance, a New Property of Coal-like Materials, 614
Etiolated *Avena* Seedlings : Growth of Wounded (C. L. Mer), 680
Euler, Prof. U. S. v., and Pernow, B. : Effects of Intraventricular Administration of Substance P, 184
Europäischen Wissenschaften und die Transzendentale Phänomenologie : Die Krisis der (Edmund Husserl), herausgegeben von Walter Biemel, *review* by F. I. G. Rawlins, 666
Europe : The O Chromosomes and the Distribution of the Dental Fricatives in (R. W. Thompson), 1095
Europe, the United States and Canada : Organization of Applied Research in (Organization for European Economic Co-operation), 778
European Atomic Energy Society : Establishment of a, 251
European Beech (*Fagus sylvatica*) in Winter : Chlorophyll in Young Shoots of (K. Gundersen), 87
European Economic Co-operation, Organization for : Organization of Applied Research in Europe, the United States and Canada, Vol. 1, A Comparative Study ; Vol. 2, Applied Research in Europe ; Vol. 3, Applied Research in the United States and Canada, 778
European Organization for Nuclear Research : Election of Sir Ben Lockspeiser as president of Council, 774
  Appointment of Prof. E. Amaldi as deputy director-general, 774
  Appointment of Prof. F. Bloch as director, 774
  Appointment of Prof. C. J. Bakker as a member of the Directorate and director of the Synchro-cyclotron Division, 775
European Science : The Cleavage in, *review* by F. I. G. Rawlins, 666
European Scientists interested in Genetical Problems : Grant of 7,500 dollars from the Rockefeller Foundation to the University of Glasgow towards the expenses of three Conferences of, 777
European Waters : Occurrence of Two East American Species of Crabs in (Torben Wolff), 188
European and American Discoveries in Polynesia : Explorers of the Pacific—(Te Rangi Hiroa) (Peter H. Buck), *review* by J. N. L. Baker, 287
Evans, G. (compiled by) : The Observer's Book of British Birds' Eggs, *review* by Bruce Coleman, 480
Evans, Dr. G. : Social and Individual Significance of Ageing, 683
Evans, John V. : Electrolyte Concentrations in Red Blood Cells of British Breeds of Sheep, 931
Evans, Dr. J. W. : Appointed director of the Australian Museum, Sydney, 1130 ; work of, 1130
Evans, Dr. R. F. : Awarded a United States Fellowship by the National Academy of Sciences, Washington, for research at Purdue University, 164
Evans, W. M., and Tranter, T. C. : 'Reaction Time' of Cast Trinitrotoluene as a Function of the Rate of Charge Cooling, 1100
Everyday Life : Science in (Ellsworth S. Obourn, Prof. Elwood D. Heiss and Gaylord C. Montgomery), *review* by Dr. Maurice Ashby, 331
Evidence for the Antiproton, 160
Evidence of Fire in South African Cave Deposits (Dr. Kenneth P. Oakley), 261
Evolution (Dr. Walter Zimmermann), *review* by the late Prof. F. E. Fritsch, 149
Evolution : *Archaeopteryx* and (Sir Gavin de Beer), 439
Evolutionary Concepts : The Rise of, *review* by the late Prof. F. E. Fritsch, 149
Ewart, D. G. : Constants of the Stellar Velocity Ellipsoid, 297
Ewe : Effect of Thyroxine on Sexual Behaviour in the (F. M. Labban), 933
Ewing, Maurice (Press, Frank, and) : Microseisms, 302
Examination of Soil Micro-organisms in their Natural Environment (Mrs. F. E. S. Alexander and R. M. Jackson), 750
Excavation of a Shell Mound at Palo Seco, Trinidad : On the (J. A. Bullbrook), *review* by Dr. G. H. S. Bushnell, 287
Excavations at Wari, Ayacucho, Peru (Wendell C. Bennett), *review* by Dr. G. H. S. Bushnell, 287
Exchange of ^{14}C-Glucose-1-phosphate with Uridine-diphosphate-glucose by the Galacto-Waldenase System (Dr. Raúl E. Trucco), 1103
Excised Tomato Roots : Norvaline, a Growth Factor for (William G. Boll), 517
Excitation of Optical Levels by Particles of Relatively Low Energy : Chemical Action of Ionizing Radiations—(Dr. Joseph Weiss), 78
Excited States of Atoms : Measurements of Lifetimes of, by the Method of Delayed Coincidences (the late S. Heron, R. W. P. McWhirter and Dr. E. H. Rhoderick), 564
Excretion in Human Urine of an Unknown Amino-acid derived from Dates (Stanley Gartler and Prof. Th. Dobzhansky), 553
Excretion of Zinc by the Rat : Influence of Ethylenediamine-tetra-acetic Acid on the (M. J. Millar, M. I. Fischer, C. A. Mawson and P. V. Elcoate), 881
Existence of Tricalcium Phosphate in Bone : Isotopic Exchanges and the (Dr. J. Govaerts), 831
Exocrine Cells of the Pancreas : Fine Structure of (Dr. Cyril E. Challice and Dennis Lacy), 1150
Expansion of Grey Tin : Thermal (Dr. J. Thewlis and A. R. Davey), 1011
Experiment in the Popularization of Science, *review* by Heinz Von Foerster, 284
Experimental Chemical Carcinogenesis and the Influence of Solvents—Research in Finland (Prof. Kai Setälä), 873
Experimental Meteorology : International Symposium on (Swiss Federal Commission for the Study of Hail Formation and Hail Prevention), 589
Experimental Method : The Physics of (Dr. H. J. J. Braddick), *review* by Dr. S. Whitehead, 712
Experimental Physics : Principles of, *review* by Dr. S. Whitehead, 712
Experimental Plant Morphology, *review* by Dr. E. Ashby, 285
Experiments on Artificial Stimulation of Rain in East Africa (D. A. Davies), 256
Experiments on the Cause of Dorsiventrality in Leaves (I. M. Sussex), 351 ; (R. Snow and Mary Snow), 352
Explorers of the Pacific—European and American Discoveries in Polynesia (Te Rangi Hiroa) (Peter H. Buck), *review* by J. N. L. Baker, 287
Extension of Range of the Angwantibo (D. R. Rosevear), 190
Extension Services in Applied Biology : Education and (Association of Applied Biologists' Symposium on), 768
External Affairs, Department of (Antarctic Division), Melbourne : Interim Report No. 7, Scientific Observations on Heard Island (P. G. Law and T. Burstall), 1132
External Metasomatism associated with Serpentine (Sir Edward Bailey and Prof. W. J. McCallien), 836
Extra-Mural Work of Universities : Science in the (Prof. Robert Peers), 166
Extraction of ACTH from Human Pituitaries (C. L. Hewett, B. Cruickshank and A. R. Currie), 745
Extraction with Constant Salt Concentration : Fractionation of Deoxyribonucleoprotein with Successive (J. A. Lucy and Prof. J. A. V. Butler), 32
Extraction of Intact Crystalline Inclusions from the Cells of Plants Infected with Tobacco Mosaic Virus : Rapid (Dr. Miguel Rubio Huertos), 313
Eye (Living Human) : Measurement of Rhodopsin in the (Dr. W. A. H. Rushton and Dr. F. W. Campbell), 1096
Eye Movements accompanying Voluntary Head Movements : Measurement of (F. Hodgson and Dr. Mary P. Lord), 75
Eyles, D. E., and others : Nutritive Value of Lucerne Protein Concentrates, fed with and without Cholesterol, 227
Eyles, V. A. : Nicolaus Steno, Seventeenth-Century Anatomist, Geologist and Ecclesiastic, 8
  Minerals used in Industry, *review*, 574
Eyquem, Dr. A. (Dujarric de la Rivière, Dr. R., et) : Les groupes sanguins chez les animaux, *review* by Dr. A. E. Mourant, 898
Eyraud, I. : Atomic Line Spectra, 731
Eysenck, Dr. H. J. : Appointed to the University of London chair of psychology at the Institute of Psychiatry, 955

FAGUS *sylvatica* in Winter : Chlorophyll in Young Shoots of European Beech (K. Gundersen), 87
Faine, S. (Kalpainen, W. J., and) : Toxicity of Erythromycin, 969
Falcone, A. B., and others : Reversal and Mechanism of Oxidative Phosphorylation, 401
Falkenbergia rufolanosa in the Isle of Man : Occurrence of (M. I. Walker, Dr. E. M. Burrows and Dr. S. M. Lodge), 315
Fallen Snow : Newly, and Air Temperature (Prof. Mario Bossolasco), 362
Family Planning (Dr. Philip M. Bloom), 215
Fano, Dr. U. : Nuclear and Meson Physics, 531
Faraday, Michael (Prof. James Kendall), 864
Faraday Society : General Discussion on Coagulation and Flocculation, 344
Farbwelt fur Rotgrünblinde : Rotgrünblindheit als Erlebnis—Fuhrer durch die (Dr. Heinz Ahlenstiel), *review* by Prof. W. D. Wright, 989
Farmer, Dr. F. T. (Clark, Dr. R. E. D., and) : A New Type of High-Voltage Machine, 1065
Farmer, Dr. F. T. (Fowler, J. F., and) : Conductivity induced in Polytetrafluoroethylene by X-Rays, 136
  Conductivity induced in Polystyrene by X-Rays, 800
Farmers : The First Colonization of Britain by, *review* by Prof. V. G. Childe, 575
Farmilo, C. G. (Bartlet, J. C., and) : Determination of the Origin of Opium by means of the Composition of the Ash, 407
Farquhar, R. M., and others : Estimates of Age for some African Minerals, 1006
Farris, Dr. E. J. : Fertility, 493
Fasciola hepatica : Maintenance *in vitro* of (Dr. Ben Dawes), 654
Fasting Blood-Sugar Level of the Rat : Effect of Acetate on the (R. J. Garner and R. Roberts), 1194
Fat : Participation of Coenzyme A in the Oxidation of (Prof. F. Lynen), 962
Fat (Maternal Liver) : Relationship between, and Foetal Weight in Ovine Pregnancy (N. L. Ferguson), 277
Fatigue of Copper : Structural Changes during the (R. B. Davies), 980
Fats (Animal) : Occurrence of *trans*-Acids in (L. Hartman, Dr. F. B. Shorland and I. R. C. McDonald), 185
Fats (Natural) : Occurrence of Fatty Acids with Uneven-numbered Carbon Atoms in (Dr. F. B. Shorland), 603
Fatty Acids : Electrophoretic Movement of Higher, on Filter Paper (Dr. A. John G. Barnett and D. K. Smith), 659
  Occurrence of, with Uneven-numbered Carbon Atoms in Natural Fats (Dr. F. B. Shorland), 603
Fatty Acids (Straight-chain Saturated) : A Chromatographic Method for the Estimation of Oleic and Linoleic Acids in the presence of (W. Mary L. Crombie, R. Comber and S. G. Boatman), 181

Fauna of the Chatham Islands : The Intertidal Flora and (G. A. Knox), 871
Fauna Preservation Society of Nyasaland The Mixed Game Reserve, 587
Fawcett, Sir Luke : Appointed a member of the United Kingdom Atomic Energy Authority, 64
Fea, G. · Physics of Clouds and Precipitation, 959
Federation of British Industries : Conference on Technical Colleges and Industry, 210
Presidential Address (Sir Harry Pilkington), 779
A Career for the Graduate in Industry, 1115
Industry and the Graduate, 1115
Federation of Mathematics and Physics Societies of Yugoslavia—Congress in Zagreb (Stevan Dedijer), 1179
Feeding Behaviour of Birds : Social (Austin L. Rand), 301
Fehr, K., and others : Vitamin B$_{11}$ in Crude Liver Extracts, 558
Feldberg, Dr. W., and Malcolm, J. L. Chemistry in relation to the Development of the Nervous System, 455
Fell, Dr. Honor B. : Tissue Culture, *review*, 809
Fellows of the Royal College of Surgeons of England 1930–1951 : Lives of the (the late Sir D'Arcy Power, and continued by W. R. Le Fanu), *review* by Sir Gordon Gordon-Taylor, 51
Fellowship (Tin Research Institute), 864
Fellowship in Aeronautics : English Electric Research (awarded to M. E. Filby), 680
Fellowship in the field of Organic Chemistry : Research (sponsored by the Geigy Company for one year in the University of Birmingham), 1132
Fellowship for Research in Nutrition · Drummond, 955
Fellowship Awards for Research in Chemistry for 1954–55 : Ramsay Memorial, 112
Fellowships : Locke Research (Royal Society Awards), 1174
Mond Nickel (Awards for 1954), 1174
Fellowships for 1954–55 : Postgraduate (National Research Council of Canada), 540
Fellowships for British Scientists : United States Research, 164, 1173
Fellowships in Statistics : Postdoctoral (University of Chicago), 777
Feltham, Dr. P. · Rheology in Mechanical Engineering, 202
Appointed a lecturer in metallurgy in the Department of Coal Gas and Fuel Industries with Metallurgy and Chemical Engineering, University of Leeds, 863
Ferguson, Dr. K. A. · Prolonged Stimulation of Wool Growth following Injections of Ox Growth Hormone, 411
Ferguson, N. L. : Relationship between Maternal Liver Fat and Foetal Weight in Ovine Pregnancy, 277
Ferguson, Sheila, and Fitzgerald, Hilde : Studies in the Social Services, *review* by Miss M. P. Hall, 851
Fermentation : Cocoa (R. V. Wadsworth and G. R. Howat), 392
Fermi, Prof. E. : What can we Learn with High-energy Accelerators (Retiring Presidential Address to the American Physical Society), 914
Death of, 1040
Fermor, Sir Lewis : *Obituary* by Dr. W. D. West, 380
Fern Apex · Effect of Deep and Shallow Incisions on Organogenesis at the (Prof. C. W. Wardlaw and E. G. Cutter), 734
Ferranti, B. de : Ferroelectric Properties of Single Crystals, 1093
Ferret : Effect of Pituitary Stalk Section on Light-induced Œstrus in the (B. T. Donovan and Prof. G. W. Harris), 503
Ferrets : Effect of Cervical Sympathectomy on the Onset of Œstrus in (M. E. Abrams, W. A. Marshall and A. P. D. Thomson), 311
Ferri, A. G., and others : Intracellular Distribution of Histamine, 698
Ferric Carbohydrate : Placental Transfer of a High Molecular (Prof. Gunnar Nylander), 310
Ferrites : Ferromagnetic Resonance in (P. A. Miles), 177
Ferrocytochrome *c* : Phosphorylation coupled with the Oxidation of, by Heart Sarcosomes (Dr. E. C. Slater), 1143
Ferroelectric Properties of Single Crystals (Radio Components Research and Development Committee Colloquium on), 1091
Ferromagnetic Resonance in Ferrites (P. A. Miles), 177
Fert, Prof. Ch. (Dupouy, Prof. G., and) : Electron Optics, 825
Fertility, Society for the Study of · Annual Conference, 493
Fertilization (Delayed) : Independence of, and Spontaneous Triploidy in Mouse Embryos (A. H. Gates and Dr. R. A. Beatty), 356
Fertilizers in Fishponds (C. H. Mortimer), *review* by F. T. K. Pentelow, 1120
Fibers : Fundamental Principles of Polymerization—Rubbers, Plastics and (Dr. G. F. D'Alelio), *review* by Prof. H. W. Melville, 52
Fibre Friction (Textile Institute Conference on), 113
Fibres (Collagen) : Contraction and Relaxation of (Dr. I. Banga, Prof. J. Baló and D. Szabó), 788
Fibres (Elastic) Staining Reactions of, with special reference to 'Elastotic Degenerations' in the Human Skin (Prof. Theodore Gillman, Jack Penn, Doris Bronks and Marie Roux), 789
Fibres (Microscopic) : Photoelastic Effects in (A. J. Cruise), 923
Fibres (Synthetic) : Chemistry and Physics of (Plastics and Polymer Group of the Society of Chemical Industry Symposium on), 116
Fibrils (Collagen) : Structural Units in (A. C. T. North, P. M. Cowan and Prof. J. T. Randall), 1142
Fibroin (Silk) : Basic Amino-acids of (M. C. Corfield, F. O. Howitt and A. Robson), 603
Field, Dr. E. J. : Effect of Cortisone on the Neonatal Rat, 182
Field : A Method of Rearing Individual Trombiculid Mites in the (Dr. J. R. Audy and M. Nadchatram), 1021
Field Biology at the King Edward VI Grammar School, Camp Hill, Birmingham, 686
Field Studies, Council for the Promotion of (Royal Meteorological Society in conjunction with the) : Vacation Course in Synoptic Meteorology, 633
Field Theory : A Survey of (Physical Society Meeting on), 863
Fields, P. R., and others : Spontaneous Fission Properties of Elements 97, 98, 99 and 100, 265
Fields and Particles (Prof. J. A. Wheeler), 914
Fields and Waves in Modern Radio (Simon Ramo and Prof. John R. Whinnery), second edition, *review* by Dr. L. Jacob, 7
Fieldwork · The Status of Geography and the Role of (Prof. S. W. Wooldridge), 1039
Filby, M. E. · Awarded the English Electric Research Fellowship in Aeronautics, 680
Filer, E. W., and others : A New Iron Borocarbide, 978
Film and the Social Sciences, 917
16-mm. Film : Photographs of Serial Sections of the Lung projected rapidly in Sequence using (Dr. Brian E. Heard), 319
Films extending from the Edge of Pools or from Menisci : Resistance to Flow of Liquids over Solids by Thin (E. B. Bielak, G. F. N. Calderwood and Dr. E. W. J. Mardles), 1009
Films of Poly-di-methyl Siloxanes on Organic Liquid Substrates : Surface (W. H. Banks), 365
Filter Paper : Electrophoretic Movement of Higher Fatty Acids on (Dr. A. John G. Barnett and D. K. Smith), 659
Filters (Interference) : New Types of, of Greater Areas and Higher Contrast (A. Hermansen), 218
Fin . A Supernumerary Pelvic, in the Powan (*Coregonus clupeoides* Lacépède), (F. W. K. Gervers), 935

Fryer, J. D. : Methods of Land-Clearance for Agriculture, 69
  Weed Control, 1179
Fuel, Institute of : New Education Scheme of the (Dr. D. T. A. Townend), 489
Fuel Research Board : Report for 1953, 588
Fuel and Power, Ministry of : Appointment of K. T Spencer as chief scientist, 382
Fuels : Smokeless (Sir Charles Ellis), 1130
Fujii, Dr. T. : Presence of Zinc in Nucleoli and its Possible Role in Mitosis, 1108
Fulbright Programme : Travel Grants under the, 1040
Fuller, C. S., and others : Bell Solar Battery, 163
Fulmer Research Institute, Stoke Poges : Open Day, 821, 1167
Fulton, Prof. John F. : Michael Servetus, Humanist and Martyr, *review* by Dr. Douglas Guthrie, 941
Function (Zoological) : Hormones and Control of (British Association for the Advancement of Science, Section D (Zoology), Discussion on), 720
Function in the Cerebral Cortex : Localization of (British Association for the Advancement of Science, Section I (Physiology), and the Physiological Society, Discussion on), 718
Function of Intracellular Ribonucleases : A Possible (Jay S Roth), 129
Function of Polyion and Counter-ion Concentration : Dielectric Increment of Sodium Alginate as a (Dr. Lars Goran Allgén), 1155
Function of Storage : Incorporation of Acetate-2-^{14}C into Human Erythrocyte Stroma as a (Dr. K. I. Altman and Scott N. Swisher), 459
Fundamental Principles of Polymerization—Rubbers, Plastics and Fibers (Dr. G. F. D'Alelio), *review* by Prof. H. W. Melville, 52
Fundamental Research : The Contribution of, to Applied Biology (Prof. V. B. Wigglesworth), 766
Fundamental Science in Agricultural Research, with special reference to the Development of Genetics (Prof. K. Mather), 998
Fundamentals of Colour Reproduction (Dr. R. W. G. Hunt), 12
Fuente, Gertrudis de la, and Diaz-Cadavieco, R. : Cocarboxylase Activity of Thiamine Phosphoric Esters, 1014
Fungal Pathogen Metabolites : Adventitious-Root Formation by, as a Possible Mechanism of Disease Resistance (Prof. M. A. Mostafa), 86
Fungal Phytopathogen : Effect of Streptomycin on the Host–Pathogen Relationship of a (Dr. K. O. Muller, J. H. E. Mackay and Janet N. Friend), 878
Fungi : Flowers and, *review* by Prof. Ronald Good, 197
  Mushrooms and Toadstools, a Study of the Activities of (Dr. John Ramsbottom), *review* by Prof. Ronald Good, 197
  Somatic Selection in (Dr. J. L. Jinks), 409
Fungi (Soil) : Test for the Pseudomycorrhizal Group of (Dr. Ida Levisohn), 408
Fungicide Research Services in Great Britain : Insecticide and, 111
Fungistatic Agents : Use of Mercurated Thiazoles as (Dr. M. K. Rout, B. Padhi and N. K. Das), 516
Furber, M. J : Appointed agricultural officer, Nyasaland, 821
Furnaces for High-Temperature Research : Solar (W. M. Conn), 490
Furth, Rear Admiral F. R. : New Laboratory of Oceanography at Woods Hole opened by, 107
Furth, Mrs. H. Littman : Proposal for a New Æther Drift Experiment, 505
Fusarium solani sensu Snyder and Hansen : Wilt of Shisham (*Dalbergia sissoo* Roxb.) due to (Dr. B. K. Bakshi), 278

GABOR, Dr. D. : New Forms of Thermionic Cathode, 1177
Gabor, Dr. D., and others : Velocity of Electron Pulses, 398, 681
Gadus callarias : 'Browning' Reactions in Freeze-dried Extractives from the Skeletal Muscle of Codling (Dr. N. R. Jones), 605
Gaffee, D. L., and Monroe, A. G. : Measurement of Small Differential Pressures at Low Absolute Pressures, 756
Galacto-Waldenase System : Exchange of ^{14}C-Glucose-1-phosphate with Uridine-diphosphate-glucose by the (Dr. Raúl E. Trucco), 1103
Galactopoietic Action of Thyroxine in Cattle kept in Subtropical Countries (Prof. M. Maqsood), 185
Galaxies in Eddington's Theory : Recession of the (Dr. N. B. Slater), 321
Galena : Adsorption of Alkyl Xanthate and Dithiophosphate on a Cleavage Face of, as revealed by Electron Diffraction (Hitosi Hagihara and Hajime Uchikoshi), 80
Galileo Galilei : Dialogue Concerning the Two Chief World Systems—Ptolemaic and Copernican (translated by Stillman Drake), *review* by Prof. E. N. da C. Andrade, 420
Gallie, Miss Elspeth M. : The Purposeful Display of Personalia and Historical Relics, 334
Gallien, Dr. L. : Comparative Endocrinology of Vertebrates, 544
Gallium : Germanium and, and their Applications (British Association for the Advancement of Science, Section B (Chemistry), Discussion on), 627
Game Reserve : The Mijedi, 587
Gametangia from a Brown Alga : Stimulation of the Discharge of, by a Change from Light to Darkness (Dr. Lionel Jaffe), 743
Gamma Isomer of Benzene Hexachloride in Cattle Dips : A Polarographic Method for the Determination of the (G. W. Walker), 44
Gamma-Ray Sources for Radiography : Memorandum on (Institute of Physics), second edition, 726
Gammarus tigrinus Sexton 1939 : Identity of (Dr. H. B. N. Hynes), 563
Ganapathy, C. V., and others : Low-temperature Sintering of Titanium Dioxide for Ceramic Capacitors, 1187
Gandy, R. O. : *Obituary* of Dr. A. M. Turing, 535
Ganglion Blockade : Development of Tolerance to, by Methonium Compounds (Dr. J. K. Mohanty), 184
Ganguli, N. C. : Modified Horizontal Migration Method in Paper Chromatography, 189
Ganguli, N. C., and others : Biosynthesis of *l*-Ascorbic Acid, 511
Ganguly, Sabrata : A Riboflavin-producing Bacterium, 559
Garampi, M. L. (Capraro, Dr. V., and) : Comparative Endocrinology of Vertebrates, 544
Garcia-Riquelme, O., and Velasco, R. : Atomic Line Spectra, 729
Garner, R. J., and Roberts, R. : Effect of Acetate on the Fasting Blood-Sugar Level of the Rat, 1194
Garrard, E. H. (Newbould, F. H. S., and) : An Actinophage for Potato Scab, 997
Garratt, A. J. : Appointed a liaison officer at the National Physical Laboratory, 110
Garrett, Dr. C. G. B. : Magnetic Cooling, *review* by Dr. K. Mendelssohn, 810
Garrett, K H. : Awarded a postgraduate research scholarship by Courtaulds' Scientific and Educational Trust Fund, 492
Garrett, Dr. S. D. : Soil-borne Pests and Diseases, 768
  The Interactions between Acid Soils and Forest Trees, 856
Garrod, Prof. L. P. : The Life and Philosophy of Almroth Wright, *review*, 621
Garstang, R. H. : Atomic Line Spectra, 730
Gartler, Stanley, and Dobzhansky, Prof. Th. : Excretion in Human Urine of an Unknown Amino-acid derived from Dates, 553
Garton, C. G. : Ferroelectric Properties of Single Crystals, 1093
Garton, W. R. S., and Bovey, Dr. L. F. H. : Atomic Line Spectra, 729
Gas for Counting : Assay of Tritium-labelled Substances—a 'Combustion Bomb' Method of Preparation of (P. R. Payne and J. Done), 27
Gas and Electricity (Research in British Power Industries), 996
Gas Engineers, Institution of : Murdoch Memorial Lecture (Dr. Alexander Fleck), 492
  Ninety-first Annual Report, 635

Gaseous Discharge as an Identifiable Radar Target : Use of (G. W. G. Court), 367
Gaseous Fluoro- and Fluorochloro-Carbons : Heats of Formation of (F. W. Kirkbride and F. G. Davidson), 79
Gaseous Mixture : Spontaneous Ignition of an Inflammable, on Release from Compression (the late Dr. W. C. F. Shepherd), 658
Gases, The Kinetic Theory of : An Introduction to Thermodynamics, and Statistical Mechanics (Prof. Francis Weston Sears), second edition, *review* by R. W. Haywood, 240
Gases (Hot) : Energy Transfer in (United States National Bureau of Standards, Circular 523), 383
Gases (Rare) : Non-isothermal Plasmas in the (R. D. Craig and Dr. J. D. Craggs), 367
Gatenby, Prof. J. Brontë : The Golgi Apparatus, 21
Gates, Allen (Runner, Meredith N., and) : Conception in Prepuberal Mice following Artificially Induced Ovulation and Mating, 222
Gates, A. H., and Beatty, Dr. R. A. : Independence of Delayed Fertilization and Spontaneous Triploidy in Mouse Embryos, 356
Gaunt, J., and Burns, W. G. : Molecular Spectroscopy, 1166
Gaunt, J. : Atomic Line Spectra, 731
Gaunt, Dr. M. : Electron Optics, 825
Gay, P. : The Species Concept in relation to the British Flora, 247
Geddes, C. J. : The Role of Trade Unions in the Future, 1089
Geering, Q. A. : Estimation of Losses from Pests, 541
Gehring, Lois Bigger (Gooder, Harry, and) : Inhibition by Cystine of Lecithinase (α-Toxin) Production in *Clostridium welchii* (*perfringens*) BP6K, 1054
Geigy Company : To sponsor a Research Fellowship in the field of organic chemistry in the University of Birmingham, for one year, 1132
Gelatin : Ion-Exchange Chromatography of Guanidino Amino-acids from Synthetically Modified (J. E. Eastoe and A. W. Kenchington), 966
Geldard, Prof. Frank A. : The Human Senses, *review* by Prof. John Cohen, 417
Gell-Mann, Dr. M. (Pais, Dr. A., and) : Nuclear and Meson Physics, 532
Gelles, Dr. E. : Appointed lecturer in chemistry at the University of Glasgow, 1039
Gemmell, Prof. A. R. : The International Botanical Congress in Paris, 717
Gene Frequencies in Strains of *Trifolium repens* L. (H. Daday), 521
Genes (*Rh* Blood-Group) : A Position Effect of the (Dr. R. Race, Dr. Ruth Sanger, Dr. P. Levine, R. T. McGee, Dr. J. J. van Loghem, Miss Mia van der Hart and C. Cameron), 460
Genetical Problems : European Scientists interested in (Grant of 7,500 dollars from the Rockefeller Foundation to the University of Glasgow towards the expenses of three Conferences of), 777
Genetical Research in Hungary : Current Trends of (Anne McLaren and Donald Michie), 390
Genetics : The Biochemistry of (Prof. J. B. S. Haldane), *review* by Dr. David M. Bonner, 526
  Fundamental Science in Agricultural Research, with special reference to the Development of (Prof. K. Mather), 998
  Rice Breeding and (K. Ramiah and M. B. V. N. Rao), 862
  A Treatise of, *review* by Dr. G. Pontecorvo, 987
Genetics (Biochemical) : Root Culture and (W. G. Boll), 820
Genetics in relation to other Biological Sciences (British Association for the Advancement of Science, Sections D (Zoology) and K (Botany), Discussion on), 672
Genetics of Man : Social Implications of the (Dr. G. Pontecorvo), 960
Génétique : Traité de (Prof. Ph. L'Héritier), *review* by Dr. G. Pontecorvo, 987
Genius : Sir William Petty, Portrait of a (E. Strauss), *review* by Dr. A. R. Hall, 573
Geodesy and Geophysics, International Union of, 20
Geodetical and Geophysical Instruments and Equipment : Exhibition of (Italian National Research Council), 20
Geographer : The Coast and the (Prof. J. A. Steers), 440
Geographical Association : Annual Conference, 1039
Geography : Biology and (Association of Agriculture and the Burton Manor Residential College for Adult Education Course on), 253
  Pioneer Plant—The Phytogeographical Researches of Sir Joseph Dalton Hooker (Dr. W. B. Turrill), *review* by Prof. Ronald Good, 6
  Second International Conference of Teachers of, 633
  The Status of, and the Role of Fieldwork (Prof. S. W. Wooldridge), 1039
Geography at Edinburgh, 295
Geography at University College, Leicester, 17
Geological Society : Meeting on the Piltdown Bones and 'Implements', 61
Geological Survey Department, Gold Coast : Appointment of W. B. Tevendale as senior geologist, 209
Géologiques (Cartes) : Introduction à la lecture des (Antoine Bonte), deuxième édition, *review* by Dr. Gilbert Wilson, 668
Geologist (Amateur) : The Pleistocene Period and Work for the (H. E. P. Spencer), 70
Geology of South Africa (Dr. Alex. L. du Toit), edited and prepared for publication by Dr. S. H. Haughton, third edition, *review*, 945
Geology and Archæology of Northern France : Pleistocene, *review* by M. C. Burkitt, 987
Geometrical Isomers : Enzymatic Conversion of Two, into Enantiomorphs (W. R. Sistrom and R. Y. Stanier), 513
Geometrical Mechanics and de Broglie Waves (Prof. J. L. Synge), *review* by Dr. Abdus Salam, 900
Geometrical Optics (Dr. C. Curry), *review*, 152
Geometry : Algebraic (Prof. Solomon Lefschetz), *review* by Dr. L. S. Goddard, 7
Geophysical Bulletins, Canadian (National Research Council of Canada), Vol. 6, 954
Geophysical Conference (University of the Witwatersrand), 538
Geophysics in Canada during 1953, 954
Geophysics, Henry Salvatori Laboratory of, Stanford University, California (Prof. Joshua L. Soske), 255
George, Dr. Philip, and Hanania, Dr. G. I. H. : Effect of Hæm-linked and other Ionizations on Hæmoprotein Reactions, 33
George and Becker, Ltd., W. and J. (Griffin and Tatlock, Ltd., and) : To be merged under the title of Griffin and George, Ltd., 20
Gerard, Dr. R. W. : Chemistry in relation to the Development of the Nervous System, 455
Gerebtzoff, Dr. M. A. : Chemistry in relation to the Development of the Nervous System, 456
Germ Cells : Mammalian (edited by G. E. W. Wolstenholme, assisted by Margaret P. Cameron and Jessie S. Freeman), *review* by Dr. Gregory Pincus, 899
Germane : Bond-Lengths and Force Constants for Methane, Silane and (R. A. Ballinger and N. H. March), 179
Germanium : Fluorometric Detection and Estimation of (N. Appala Raju and Prof. G. Gopala Rao), 400
Germanium and Gallium and their Applications (British Association for the Advancement of Science, Section B (Chemistry), Discussion on), 627
Germination in Seed of Birch (*Betula pubescens* Ehrh.) : Photoperiodic Control of (M. Black and Dr. P. F. Wareing), 705
Gerontological Studies : Support for (Ciba Foundation), 162
Gerontology, International Association of : Conference on Ageing, 682
Gervers, F. W. K. : A Supernumerary Pelvic Fin in the Powan (*Coregonus clupeoides* Lacépède), 935
Ghats (Western) of India : The Flora of Khandala on the (H. Santapau), 66
Ghosh, Dr. J. J., and Quastel, Prof. J. H. : Narcotics and Brain Respiration, 28
Ghosh, P. N. (Bhaduri, Dr. P. N., and) : Chromosomal Biotypes in Emmer Wheat, 934
Ghosh, Sailendra N. : Awarded Fellowship by thesis of Heriot-Watt College, Edinburgh, 164
Gianotti, Agostino : Geografia e geologia negli scritti di Leonardo da Vinci, *review*, 152
Gibbons, Dr. R. A. : Awarded a Research Fellowship in the United States by the National Academy of Sciences, Washington, 1173
Gibbs, D. : Ferroelectric Properties of Single Crystals, 1092
Gilbert, Owen (Mason, Mrs. Betty, and) : Presence of a Peritrophic Membrane in Diplopoda, 1022
Gilbert Islands : Ethnobotany of the (Prof. Katharine Luomala), 679
Gill, D. A. : Appointed chief of the Division of Animal Health and Production, Commonwealth Scientific and Industrial Research Organization, 64
Gill, Prof. P. S. : Gulmarg Research Observatory, 300
Gillespie, A. S. : Sea-horses in a School Laboratory, 539
Gilliland, Dr. I. C. : Thyroid Function, 826
Gillman, Prof. Theodore, and others : Staining Reactions of Elastic Fibres with special reference to 'Elastotic Degenerations' in the Human Skin, 789
Gillmore, Marion H. : Microseisms, 302
Gilmour, Dr. John, and Walters, Dr. Max : Wild Flowers—Botanizing in Britain, *review* by Prof. Ronald Good, 197
Gilmour, J. S. L. : The Species Concept in relation to the British Flora, 245
Gilruth, John Anderson—the Influence of his Life and Work on the Development of the Livestock Industries of the Commonwealth (Sir Ian Clunies-Ross), 1131
Ginsberg, Prof. Morris : Title of professor emeritus of sociology in the University of London conferred on, 209
Ginsborg, Dr. B. L. : Awarded a Stothert Research Fellowship of the Royal Society, 18
Ginsburg, Dr. M. : Comparative Endocrinology of Vertebrates, 545
Girdwood, Dr. R. H. : Disorders of the Alimentary Tract and their Nutritional Effects, 1090
Gjessing, Prof. R. : Chemistry in relation to the Development of the Nervous System, 457
Glad, S. : Atomic Line Spectra, 729
Gland (Mammary) : Use of Glutamine by the, for the Synthesis of Casein (J. M. Barry), 315
Glass 'Cage' : Trapped Atoms and Radicals in a (Dr. Irwin Norman and Dr. George Porter), 508
Glass Cell for Preparative Counter-Current Distribution : A New (M. Verzele and F. Alderweireldt), 702
Glass Models of *cyclo*Hexane, Decalin and Steroid Systems : Fluorescent (W. Brady), 590
Glass Powder : Fractionation of Serum Proteins by Zone Electrophoresis in (C. J. Bradish and Nan V. Smart), 272
Glass Rubber Transition in Polyethylene Terephthalate Filaments : Effects of Crystallization on the (D. W. Woods), 753
Glass and Ceramic Research Institute, Central (Calcutta) : *Bulletin*, Vol. 1, No. 1, 1086
Glasses (Tellurite) : Dielectric Properties of (J. Ph. Poley), 268
Glasshouse Crops Research Institute, Littlehampton : Resumption of Mushroom Research, 252
Glassware : Volumetric—Scientific Aspects of Design and Accuracy (National Physical Laboratory, Notes on Applied Science, No. 6), 635
Glees, Dr. F. P. : Localization of Function in the Cerebral Cortex, 720
Glentress Forest (Forestry Commission Booklet), 391
Glover, Prof. R. E. : Appointed principal and dean of the Royal Veterinary College, 1132
Gluck, Miss Helen : The Dilemma of the Painter and Conservator in the Synthetic Age, 334
Gluckman, Prof. Max : Rituals of Rebellion in South-East Africa (Frazer Lecture for 1952), 72
Glucose and Glycerol across the Red Cell Membrane : Passage of (Freda Bowyer), 355
d(−)Glutamic Acid in Tumour Proteins : Metabolism and the Occurrence of (Dr. Gunther Hillmann, Anneliese Hillmann-Elies and Friedrich Methfessel), 403
Glutamine : Use of, by the Mammary Gland for the Synthesis of Casein (J. M. Barry), 315
Glutathione Breakdown and Transpeptidation Reactions in *Proteus vulgaris* (Pamela Samuels Talalay), 516
Glycerol across the Red Cell Membrane : Passage of Glucose and (Freda Bowyer), 355
Glycerol studied with Variants of *Bacillus subtilis* : Oxidative Dissimilation of (Prof. J. M. Wiame, S. Bourgeois and R. Lambion), 37
Glycerol Oxidation in *Acetobacter suboxydans* : Alternate Pathways of (Jens G. Hauge, Tsoo E. King and Prof. Vernon H. Cheldelin), 1104
Glycine : Effect of, on the Survival of Bull Spermatozoa *in vitro* (A. Roy and Marcus W. H. Bishop), 746
Glycine-2-^{14}C : Nuclear Uptake of, in the Newt Embryo (J. L. Sirlin and Prof. C. H. Waddington), 309

Glycine and Serine in Bakers' Yeast: Origin of (Chih H. Wang, J. Wendell Davis, Prof. Vernon H. Cheldelin and Prof. Bert E. Christensen), 1145
Glycogen Secretion in the Epididymis (Dr. Lennart Nicander), 700
Glyoxylic and Succinic Acids from *d*-isoCitric Acid: The *d*-isoCitric Lyase System—the Formation of (Dr. J. A. Olson), 695
Goat Udder (Lactating): Synthetic Activity of a Single Epithelial Cell of the (K. C. Richardson and Dr. S. J. Folley), 828
Goddard, C. K.: Hormones and Control of Zoological Function, 721
Goddard, Dr. L. S.: Algebraic Geometry, *review*, 7
Ideal Theory, *review*, 7
Principles of Numerical Analysis, *review*, 624

Hudson, Dr. C. S.: Aircraft Electrical Systems, 1001
Hudson, Dr. J. C.: Appointed head of the Corrosion Advice Bureau of the British Iron and Steel Research Association, 386
Hufschmidt, H.-J., and Hufschmidt, Tamara: Antagonist Inhibition as the Earliest Sign of a Sensory-Motor Reaction, 607
Hufschmidt, Tamara (Hufschmidt, H.-J., and): Antagonist Inhibition as the Earliest Sign of a Sensory-Motor Reaction, 607
Hughes, Dr. A. F. W.: Chemistry in relation to the Development of the Nervous System, 455
Hughes, A. P.: Awarded a Nature Conservancy Research Studentship in Botany, 727
Hughes, F. E.: Appointed chief conservator of forests, Gold Coast, 344
Hughes, Dr. M. H.: Appointed special pathologist, Gold Coast, 864
Hughes, P.: Awarded the John Murray Travelling Studentship in Oceanography and Limnology of the Royal Society, 18
Hughes Medal for 1954 of the Royal Society awarded to Martin Ryle, 908, 1032
Huizenga, J. R., and others: Spontaneous Fission Properties of Elements 97, 98, 99 and 100, 265
Hulburt, E. O.: The Physics of the Ionosphere, 867
Hulme, Dr. A. C.: A New Amino-acid in the Peel of Apple Fruits, 1055
Hulthén, E.: Atomic Line Spectra, 730
Human Blood and Tissues: Progesterone in (Josef Zander), 406
Human Blood Platelets: Blood Groups of (Prof. P. Moureau and Dr. A. Andre), 88
Human Bone Marrow Cells *in vitro*: Utilization of Formate-^{14}C for Synthesis of Deoxyribonucleic Acid by (Dr. L. G. Lajtha), 1013
Human Erythrocyte Stroma: Incorporation of Acetate-2-^{14}C into, as a Function of Storage (Dr. K. I. Altman and Scott N. Swisher), 459
Human Eye (Living): Measurement of Rhodopsin in the (Dr. W. A. H. Rushton and Dr. F. W. Campbell), 1096
Human Milk (Artificial): The Rat as a Test Animal in evaluating, for Infants (Prof. Paavo Roine, Helge Gyllenberg, Marjatta Rossander and Ritva Vuokila), 519
Human Nature: Science and (Dr. E. D. Adrian), 433
Human Pituitaries: Extraction of ACTH from (C. L. Hewett, B. Cruickshank and A. R. Currie), 745
Human Plasma: Development of Pain-producing Substance in (Desiree Armstrong, Prof. C. A. Keele, Dr. J. B. Jepson and J. W. Stewart), 791
Human Problems in Industry: Commonwealth Conference on (Industrial Welfare Society), 206
Human Red-Cell Stroma: Electrophoresis of (T. A. J. Prankerd, Dr. K. I. Altman and J. R. Anderson), 1146
Human Relations in Industry, 49, 677
Human Senses: The (Prof. Frank A. Geldard), *review* by Prof. John Cohen, 417
Human Serum: Neutralization of Silkworm Jaundice Virus by (K. Aizawa), 748
Human Skin: Staining Reactions of Elastic Fibres with special reference to 'Elastotic Degenerations' in the (Prof. Theodore Gillman, Jack Penn, Doris Bronks and Marie Roux), 789
Human Society in Ethics and Politics (Bertrand Russell), *review* by Prof. T. S. Simey, 1162
Human Urine: Excretion in, of an Unknown Amino-acid derived from Dates (Stanley Gartler and Prof. Th. Dobzhansky), 553
Humane Vivisection: Research on, 488
Humanity: Science, Animals and (W. Lane-Petter), 532
Hume, I. Noel: The Marshes of the Medway Estuary in Romano-British Times, 91
Hume-Rothery, Dr. W.: Metallurgy of Chromium, *review*, 422
  Journal of the Institute of Metals, *review*, 576
Humphries, C. J.: Atomic Line Spectra, 730
Hungarian Physiological Society: Twentieth (anniversary) Annual Conference, 545
Hungarian Scientific Exchanges, 909
Hungary: Current Trends of Genetical Research in (Anne McLaren and Donald Michie), 390
  Physiology in (Dr. Joseph Needham and Dr. Dorothy M. Needham), 545
Hunt, A. J.: Economic Survey of the British East African Territories, 114
Hunt, Dr. R. W. G.: Fundamentals of Colour Reproduction, 12
Hunter, Dr. A.: *Obituary* of Dr. Henri Mineur, 338
Hunter, G. L., and others: Successful Inter-breed Transfer of Ova in Sheep, 890
Hunter, Prof. R. B.: Disorders of the Alimentary Tract and their Nutritional Effects, 1091
Huntsman, Prof. A. G.: Salmon Migration and the Environment, 215
Hurley, T. F.: International Peat Symposium 1954, 483
Hussain, Dr. Z.: Awarded the Padma Vibhushan Pahela Varg (first class) by the President of India on Independence Day, 428
Husserl, Edmund: Die Krisis der Europäischen Wissenschaften und die Transzendentale Phänomenologie (herausgegeben von Walter Biemel), *review* by F. L. G. Rawlins, 666
Hutchins, Dr. Robert M.: The University of Utopia, 940; *review* by R. Brightman, 1164
Hutchinson, J. B., and others: The Flavour of Porridge, 458
Hutton, K. E.: Eradication of *Venturia inaequalis* (Cooke) Wint., 1017
Hutton, R. G. (Hessayon, Dr. D. G., and): *In vitro* Production of Tropical Black Earth, 612
Huxley, Prof. Julian: 'The Case for Natural Selection', 279

Hyaluronate Solutions : Flow Potentials in (C. E. Jensen, Jørgen Koefoed and Thure Vilstrup), 1101
Hyaluronidases (Bacterial) : Production of Unsaturated Uronides by (Alfred Linker and Dr. Karl Meyer), 1192
Hybrids (Triploid Dactylorchid) : Cytology of (Prof. J. Heslop-Harrison), 112
Hydén, Dr. H. : Chemistry in relation to the Development of the Nervous System, 456
Hydén, Dr. H. (Edström, Jan-Erik, and) : Ribonucleotide Analysis of Individual Nerve Cells, 128
Hyderabad Central Laboratories for Scientific and Industrial Research : Report for 1952, 868
Hydraulics Research Board : Report of the, with the Report of the Director of Hydraulics Research for the Year 1953, 348
Hydrocarbon Insecticides (Chlorinated) : Houseflies Resistant to a Group of (Dr. J. R. Busvine), 783
Hydrocarbons : Physical Constants of (Gustav Egloff), Vol. 5, Paraffins, Olefins, Acetylenes and other Aliphatic Hydrocarbons, *review* by Dr. E. F. G. Herington, 1164
Hydrocarbons (Carcinogenic) : Action of Squalene upon (Dr. Harry Sobel and Jesse Marmorston), 553
Hydrocarbons and related Compounds : Selected Values of Physical and Thermodynamic Properties of—Comprising the Tables of the American Petroleum Institute Project 44 (Prof. Frederick D. Rossini, Prof. Kenneth S. Pitzer, Raymond L. Arnett, Rita M. Braun and Prof. George C. Pimentel), *review* by H. B. Milner, 54
Hydroelectric Pile : Production of Electric Power by mixing Fresh and Salt Water in the (R. E. Pattle), 660
Hydrogen in the Manufacture of Steel (K. C. Barraclough), 111
Hydrogen Engine (R. O. King and Mogens Rand), 975
Hydrogen Nebulae (Ionized) : Radio Observations of, and other Discrete Sources at a Wave-length of 9·4 cm. (F. T. Haddock, C. H. Mayer and R. M. Sloanaker), 176
Hydrogen Reduction of Tungsten Oxides (M. G. Charlton), 703
Hydrogenated Mutton Fat : Isolation of *n*-Heptadecanoic Acid from (R. P. Hansen, F. B. Shorland and Dr. N. J. Cooke), 39
Hydrological Survey Department, Uganda : Appointment of W. G. Owen as geographer, 344
Hydrolysis of Methylglucosides (Dr. C. A. Bunton, T. A. Lewis, D. R. Llewellyn, H. Tristram and C. A. Vernon), 560
Hydromechanics Research Association, British : Annual Report for 1952–53, 259
Hydropolyp in the Biological Cycle of a Freshwater Jellyfish (Dr. J. Bouillon), 1112
5-Hydroxytryptamine, its Occurrence in Cowhage (Dr. K. Bowden, Dr. Barbara G. Brown and Dr. Jean E. Batty), 925
Hygiene : Modern Food, *review* by Osman Jones, 285
Hygiene (Food) : Food Poisoning and (Dr. Betty C. Hobbs), *review* by Osman Jones, 285
Hylleraas, E. A. : Atomic Line Spectra, 730
Hynes, Dr. H. B. N. : Identity of *Gammarus tigrinus* Sexton 1939, 563
Hyoscyamine : Biogenesis of (E. Leete, Dr. Léo Marion and I. D. Spenser), 650
Hyperglycaemic Glycogenolytic Factor : Abdominal Lymphatic Tissue as a Source of (M. R. Raja Rama Rao and Dr. N. N. De), 229
Hypotensive Action of Reserpine, an Alkaloid of *Rauwolfia serpentina* : Mechanism of (Dr. E. G. McQueen, Dr. A. E. Doyle and Dr. F. H. Smirk), 1015

IBALL, Dr. John (Clark, Mrs. Sheena M., and) : Orientation of Apatite Crystals in Bone, 399
Ice Ages : A Climatological and Astronomical Interpretation of the, and of the Past Variations of Terrestrial Climate (Dr. E. J. Öpik), 172
Ideal Theory (Prof. D. G. Northcott), *review* by Dr. L. S. Goddard, 7
Identifiable Radar Target : Use of a Gaseous Discharge as an (G. W. G. Court), 367
Identification of an Artefact on Chromatograms of the Keto acid 2,4-Dinitrophenylhydrazones (G. H. N. Towers and D. C. Mortimer), 1189
Identification of certain 'Ketosteroids' from Cattle Urine as Ionone Derivatives (A. H. Holtz), 316
Identity of *Gammarus tigrinus* Sexton 1939 (Dr. H. B. N. Hynes), 563
Iggo, B., and others : Use of *p*-Chloromercuribenzoic Acid in the Determination of Ascorbic Acid in the presence of Sulphydryl Compounds, 701
Iglesias, Dr. Rigoberto, and others : Antioestrogenic Potencies of various Progesterone Derivatives with Oxidation at C_{11}, 839
Ignition of an Inflammable Gaseous Mixture on Release from Compression : Spontaneous (the late Dr. W. C. F. Shepherd), 658
Ikeda, H., and others : Destruction of Tumour Cells by Rift Valley Fever Virus, 698
Illumination (Kohler) : A Light Source for (Dr. O. V. S. Heath), 506
Illumination and the Twilight Movements of a Sonic Scattering Layer : Submarine (Elizabeth M. Kampa and Brian P. Boden), 869
Ilmenite (Natural) : Oxidation Changes in (C. E. Curnow and L. G. Parry), 1101
Image Intensifier Radiographs : Visibility of X-Ray Quantum Fluctuations on (Dr. T. Tol and Dr. W. J. Oosterkamp), 397
Imidazole and its Derivatives (Prof. Klaus Hofmann), Part 1, *review* by Dr. James D. Loudon, 241
Immobilization of Mineral Nutrients in Tropical Soils (W. V. Bartholomew, J. Meyer and H. Laudelout), 23
Imperial Chemical Industries, Ltd. : Gift of £20,000 to the Department of Textile Industries, University of Leeds, towards the cost of equipping the new man-made fibres building, 1040
Imperial College of Science and Technology : Vacation School on Aircraft Electrical Systems, 67, 1001
  Appointment of Prof. R. M. Barrer to the University of London chair of physical chemistry, 112, 205
  Retirement of Prof. H. V. A. Briscoe from the directorship of the laboratories for inorganic and physical chemistry, and the University of London chair of inorganic chemistry, 205
  Title of professor emeritus of inorganic chemistry in the University of London conferred on Prof. H. V. A. Briscoe, 209
  Title of professor emeritus in mathematics in the University of London conferred on Prof. Hyman Levy, 209
  Retirement of Prof. H. Levy from the chair of mathematics, 295
  Appointment of Dr. Nicol Gross to the University of London readership in production engineering, 777
  Appointment of Prof. R. P. Linstead as rector, 1130
Impregnation of Small Friable Objects (E. Martin Burgess), 587
Improvements in Vapour-phase Chromatography at Relatively High Temperatures (P. R. Cropper and A. Heywood), 1063
Impurities in Liquid Chlorine : Estimation of, by Infra-red Absorption Spectrophotometry (A. W. Pross), 467
Inability of Acetylcholine Antagonists to protect Mice against the Toxicity of 'Tensilon' (M. W. Parkes and P. Sacra), 969
Inactivation of the Chromatophore-expanding Activity of Pituitary Extracts by Ascorbic Acid (Dr. Marg. Holzbauer and Dr. R. Rigler), 877
Inactivation of Phage labelled with Phosphorus-32 : Effect of Temperature on the (C. Castagnoli and F. Graziosi), 599
Inagami, Kaoru : Mechanism of the Formation of Red Melanin in the Silkworm, 1105
Inbred Lines ? Why use (Dr. J. D. Biggers and P. J. Claringbold), 596
Incisions (Deep and Shallow) : Effect of, on Organogenesis at the Fern Apex (Prof. C. W. Wardlaw and E. G. Cutter), 734
Inclusions (Intact Crystalline) : Rapid Extraction of, from the Cells of Plants Infected with Tobacco Mosaic Virus (Dr. Miguel Rubio Huertos), 313
Incorporation of Halogenated Pyrimidines into the Deoxyribonucleic Acids of *Bacterium coli* and its Bacteriophages (D. B. Dunn and Dr. J. D. Smith), 305 ; (Dr. Stephen Zamenhof and Mrs. Gertrude Griboff), 306
Increase of Electrical Breakdown Strength of Air at Low Pressure in the Region of 300 Mc./s. : Artificial (G. W. E. Stark and G. L. Fougere), 1066
Increase of Respiratory-rate in Sweet Potato Tissue Infected with Black Rot (Dr. Ikuzo Uritani, Takashi Akazawa and Miyoko Uritani), 1060
Incubation and Infection of an Infectious Disease : A Statistical Method of Estimating the Periods of (Norman T. J. Bailey), 139
India : The Flora of Khandala on the Western Ghats of (H. Santapau), 66
  Kornerupine from Rannu, Uttar Pradesh (Dr. M. V. N. Murthy), 1065
  The Vegetation Types of (Indian Botanical Society Symposium on), 113
Indian Association for the Cultivation of Science : Annual Report for 1953–54, 495, 1045
Indian Botanical Society : Symposium on the Vegetation Types of India, 113
Indian Cashew-nut Shell Liquid : Olefinic Nature of Anacardic Acid from (V. J. Paul and Prof. Lourdu M. Yeddanapalli), 604
Indian Ceramic Society : Silver Jubilee of the, 538
Indian Independence Day Decorations, 428
Indian Ink Method for examining Micro-organisms : The Wet-film (Dr. J. Rishbeth), 361
Indian Journal of Fisheries, Vol. 1, Nos. 1 and 2, 1131
Indian Library Association : Union Catalogue of Learned Periodical Publications in South Asia, Vol. 1, 342
Indian Montmorillonites : X-Ray and Differential Thermal Studies of some (A. K. Bose and Purnima Sengupta), 40
Indian Ocean : Siphonophora of the (A. K. Totton), 501
Indirect Effect of Ultra-Violet Light on Skin Blood Vessels (M. W. Partington), 134
Individual Nerve Cells : Ribonucleotide Analysis of (Jan-Erik Edström and Holger Hydén), 128
Indo-Pacific Area : List of Scientific and other Periodicals published in the (Indo-Pacific Fisheries Council), second edition, 962
Indo-Pacific Fisheries Council : Special Publication No. 2, Fish Culture in Indonesia (general editor, G. L. Kesteven), 961
  List of Scientific and other Periodicals published in the Indo-Pacific Area, second edition, 962
Indonesia : Fish Culture in (general editor, G. L. Kesteven), (Indo-Pacific Fisheries Council, Special Publication No. 2), 961
Induced Enzyme Formation due to Co-enzyme Deficiency : Apparent (A. A. Hakim and Prof. Frank C. Happold), 358
Induction of Tumours with 1-(2-Tolylazo)-2-naphthol (Oil Orange *TX*), (Dr. G. M. Bonser, Dr. D. B. Clayson and Dr. J. W. Jull), 879
Induction Motor : The Synchronous (J. Griffin), *review* by H. M. Clarke, 944
Industrial Chemistry : Seventeenth International Congress of, 386
Industrial Development : Scientific Advances and, 145
Industrial Diamond Information Bureau : The Diamond Tool Industry in 1953, 431
Industrial Engineering—Report of a visit to the U.S.A. in 1953 of a British Specialist Team on Industrial Engineering (British Productivity Council), 893
Industrial Power from Nuclear Energy (Sir Christopher Hinton), 1085
Industrial Productivity : Scientific Research and (Sondes Place Research Institute, Occasional Bulletin No. 7), 1130
Industrial Research and Development in the United States, 26
Industrial Research Associations in Great Britain (G. L. Bailey), 547 ; (Dr. S. Whitehead), 547 ; (Sir Reginald Rootes), 547
Industrial Solvents : Chemical Analysis of (Dr. Morris B. Jacobs and Dr. Leopold Scheflan), *review* by C. Whalley, 197
Industrial Welfare Society : Commonwealth Conference on Human Problems in Industry, 206
Industrial and Manufacturing Chemistry (Geoffrey Martin), Part 1, Organic, seventh edition revised by Edward I. Cooke, *review* by H. M. Langton, 419
Industries : Chemicals for the Chemical and Allied (Sydney J. Johnstone), *review* by V. A. Eyles, 574
Industry : A Career for the Graduate in (Federation of British Industries), 1115
  Human Problems in (Industrial Welfare Society Commonwealth Conference on), 206
  Human Relations in, 49, 677
  Minerals used in, *review* by V. A. Eyles, 574
  The Oil, 299
  Phillips Serving Science and, Vol. 1, No. 1, 587
  Radiation Hazards in (British Occupational Hygiene Society Conference on), 209, 777
  Shift Work in (F. P. Cook), 1093

  Technical Colleges and, 371
  Technical Colleges and (Federation of British Industries Conference on), 210
  The University Graduate and, 1115
  Use of Scientific Developments in (British Association for the Advancement of Science, Section F (Economics), Discussion on), 728
  The Worker in (K. H. F. Murrell, A. T. Welford and Dr. H. D. Darcus), 118
Industry (American) : Scientific Research and Development in (Bulletin No. 1148 of the Bureau of Labor Statistics, United States Department of Labor), 26
Industry and the Graduate (Federation of British Industries), 1115
Industry and Research : The Microscope in (W. Watson and Sons, Ltd., Exhibition on), 386
Industry and Scientific Man-power : British (Sir Harry Pilkington), 779
Industry, Trade and Finance : Survey of (Seymour Melman), 350
Inelastic Scattering of 14-MeV. Neutrons by Lithium-7 (D. L. Allan), 267
Infants : The Rat as a Test Animal in evaluating Artificial Human Milk for (Prof. Paavo Roine, Helge Gyllenberg, Marjatta Rossander and Ritva Vuokila), 519
Infection of Chickens and Chick Embryos with the Viruses of Foot-and-Mouth Disease and of Vesicular Stomatitis (H. H. Skinner), 1052
Infection of an Infectious Disease : A Statistical Method of Estimating the Periods of Incubation and (Norman T. J. Bailey), 139
Infection of Tomato Seed by *Didymella lycopersici* Kleb. : Internal (Dorothy E. Fisher), 656
Infection and Tumour Growth : Cortisone in relation to (Prof. T. Nicol and R. S. Snell), 554
Infectious Disease : A Statistical Method of Estimating the Periods of Incubation and Infection of an (Norman T. J. Bailey), 139
Infective Larvæ (Trichostrongyle) : Size of, in 'Monobacterial' Culture (P. A. G. Wilson), 520
Infective Nematode Larvæ : The Second Ecdysis of (R. I. Sommerville), 751
Inflammable Gaseous Mixture : Spontaneous Ignition of, on Release from Compression (the late Dr. W. C. F. Shepherd), 658
Inflammatory Response : Restriction of, by Polysaccharides (M. Shilo, B. Wolman and Shlomo Hestrin), 786
Influence : Mass Communication, Power and, 709
  Power and (Lord Beveridge), 759
  Power and, in the Modern State, 759
Influence of Ribonuclease on the Division of Amphibian Eggs (L. Ledoux, J. Le Clerc and F. Vanderhaeghe), 793
Influence of Scientific Research in the Modern World (Symposium at the Research Laboratory in Geneva of the Battelle Memorial Institute), 910
Influence of Solvents : Experimental Chemical Carcinogenesis and the—Research in Finland (Prof. Kai Setälä), 873
Information Services, Overseas : Summary of the Report of the Independent Committee of Enquiry into the, 710
Infrared Absorption Spectra of Steroids (Konrad Dobriner, E. R. Katzenellenbogen and R. Norman Jones), *review* by Dr. A. E. Martin, 945
Infra-red Absorption Spectrophotometry : Estimation of Impurities in Liquid Chlorine by (A. W. Pross), 467
Infra-Red Analyses of Mixtures : Quantitative (L. R. C. McDonald), 703
Infra-Red Assignments of Unsaturation in the Region 900–1,000 cm.$^{-1}$ (Dr. D. Chapman and R. J. Taylor), 1011
Infra-red Radiation : International Symposium on (International Union of Physics, the International Commission for Optics, and others), 113
Infra-Red Spectra of Coals (R. R. Gordon, W. N. Adams, G. J. Pitt and G. H. Watson), 1098
Infra-red and Ultra-violet Absorption Spectra of Proteins in the Solid State (Elton S. Cook, Cornelius W. Kreke, Edward B. Barnes and Werner Motzel), 1144
Ingram, Dr. D. J. E., and others : Paramagnetic Resonance in Carbonaceous Solids, 797
Ingram, Miss V. : Social and Individual Significance of Ageing, 683
Inhibiting-Substances : Growth- and, in relation to the Rest Period of the Potato Tuber (K. L. J. Blommaert), 970
Inhibition of D-Amino-acid Oxidase (Eva Heimann-Hollaender and Dr. N. Lichtenstein), 559
Inhibition of the 'Condensing Enzyme' of *Aspergillus niger* by Magnesium (C. V. Ramakrishnan and S. M. Martin), 230
Inhibition by Cystine of Lecithinase (α-Toxin) Production in *Clostridium welchii* (*perfringens*) BP6K (Harry Gooder and Lois Bigger Gehring), 1054
Inhibition of Pyridoxal Phosphate Action by Toxopyrimidine Phosphate in the Tyrosine Decarboxylase System : Competitive (Dr. Katashi Makino and Masahiko Koike), 1056
Inhibition of Vernalization in *Linum usitatissimum* Linn. by certain Synthetic Hormones (Dr. S. C. Chakravarti), 461
Injections of Ox Growth Hormone : Prolonged Stimulation of Wool Growth following (Dr. K. A. Ferguson), 411
Injurious Effect of Air-saturated Water on certain Invertebrates (Prof. H. Munro Fox and Angela E. R. Taylor), 312
Inorganic Analysis : Chromatographic Methods of (Dr. F. H. Pollard and Dr. J. F. W. McOmie), *review* by E. Q. Laws, 1119
Inorganic Chemistry (Dr. E. de Barry Barnett and Dr. C. L. Wilson), *review*, 7
  Comprehensive (edited by Prof. M. Cannon Sneed, Prof. J. Lewis Maynard and Prof. Robert C. Brasted), Vol. 1, Principles of Atomic and Molecular Structure (W. N. Lipscomb), Theoretical and Applied Nuclear Chemistry (P. R. O'Connor), The Actinide Series (G. T. Seaborg), *review* by Dr. R. Spence, 944
  A Modern View of, *review* by Dr. R. Spence, 944
  Physical and, at Belfast, 110
Inorganic Chromatography (Orsino C. Smith), *review* by E. Q. Laws, 1119
Insdoc List of Current Scientific Literature (National Scientific Documentation Centre, New Delhi), 431
Insect Pests : Viruses and the Control of (Dr. Kenneth M. Smith), 1173
Insect Pests of Stored Products (Association of Applied Biologists Symposium on), 767
Insect Tissues : Culture of (T. D. C. Grace), 187
Insecticide and Fungicide Research Services in Great Britain, 111
Insecticides (Chlorinated Hydrocarbon) : Houseflies Resistant to a Group of (Dr. J. R. Busvine), 783
Insects : A Simple Microtitration Method for the Determination of Calcium and Magnesium in the Hæmolymph of (Dr. K. van Asperen and Ida van Esch), 927
  The Social (Dr. O. W. Richards), *review* by Dr. C. G. Butler, 622
Insects and the Diseases of Conifers in New Zealand (G. B. Rawlings), 1087
Instability of Milk due to a High Content of Calcium Ions (J. Boogaerdt), 884
Institut de Paléontologie humaine : Mémoire 26, Les Limons quaternaires du bassin de la Seine—Stratigraphie et archéologie paléolithique (François Bordes), *review* by M. C. Burkitt, 987
Institut Royal des Sciences Naturelles de Belgique : Mémoire No. 125, Three Abietaceous Cones from the Wealden of Belgium (K. L. Alvin), *review*, 900
Institute Medal of the Textile Institute awarded to Sir Ernest Goodale, 636
Istituto Nazionale di Ottica : Conference on Problems in Contemporary Optics, 113
Insulin Action : Enhancement of, by Pituitary Growth Hormone (P. J. Randle), 1053
Intact Crystalline Inclusions : Rapid Extraction of, from the Cells of Plants infected with Tobacco Mosaic Virus (Dr. Miguel Rubio Huertos), 313
Intact Liver Nuclei : Electrophoretic Migration of Contents of (J. St. L. Philpot and J. E. Stanier), 651
Integral Equations : Singular (N. I. Muskhelishvili), second edition, *review* by Prof. R. Hill, 713
Integument (Lamprey) : Permeability to Water of the (M. W. Hardisty), 360
Intensifier Radiographs (Image) : Visibility of X-Ray Quantum Fluctuations on (Dr. T. Tol and Dr. W. J. Oosterkamp), 397
Inter-African Phyto-Sanitary Commission, 725
Inter-African Soils Conference : Second, 112
Interaction between Metal Ions through Anions (Ryutaro Tsuchida and Dr. Shoichiro Yamada), 1064
Interactions between Acid Soils and Forest Trees (British Association for the Advancement of Science, Sections K (Botany) and K* (Forestry), Symposium on), 855
Inter-breed Transfer of Ova in Sheep : Successful (G. L. Hunter, C. E. Adams and L. E. Rowson), 890
Interdependence of Temporal and Auditory Judgments (Prof. John Cohen, C. E. M. Hansel and J. D. Sylvester), 642
Interference and Cell Protection by Poliomyelitis Virus in Tissue Culture (Dr. G. L. Le Bouvier), 649
Interference Filters of Greater Areas and Higher Contrast : New Types of (A. Hermansen), 218
Interference Microscope : Measurement of the Refractive Index of Cytoplasmic Inclusions in Living Cells by the (K. F. A. Ross), 836
Internal Infection of Tomato Seed by *Didymella lycopersici* Kleb. (Dorothy E. Fisher), 656
International Association of Gerontology : Conference on Ageing, 682
International Association of Applied Psychology : Congress, 680
International Association of University Professors and Lecturers : Eighth Conference of University Teachers, 208
International Atomic Energy Agency : British Participation in an, 1038
International Barometer Conventions : New (P. H. Bigg), 1127
International Botanical Congress in Paris (Prof. A. R. Gemmell), 717
International Commission for Optics, and others : International Symposium on Infra-red Radiation, 113
International Committee for Bird Preservation : Ninth International Conference, 59
  Report for 1953, 384
International Conference on Electron Microscopy, London, 1954 (Dr. C. E. Challice), 824
International Conference of Teachers of Geography : Second, 633
International Congress of Biochemistry : Third, 1173
International Congress of Pure and Applied Chemistry : Fourteenth, 588, 777
International Congress of Electron Microscopy, 1950, *review* by Dr. V. E. Cosslett, 330
International Congress of Industrial Chemistry : Seventeenth, 386
International Congress on Vitamin E : Third, 777
International Co-operation in the Field of Crop Protection (Association of Applied Biologists Symposium on), 766
International Council of Scientific Unions : Year Book of the (1954), 1003
International Definition and Measurement of Standards and Levels of Living : Report on (United Nations, the International Labour Office and Unesco), 350
International Horticultural Congress : Fourteenth, 636
International Institute of Refrigeration : Proceedings of the Meetings of Commissions 1 and 2 at Zurich, 297
International Labour Office, and others : Report on International Definition and Measurement of Standards and Levels of Living, 350
International Neurochemical Symposium : First (Mental Health Research Fund), 455
International Progress in Management, Council for (U.S.A.) : Wallace Clark International Management Award for 1955 presented to Lieut.-Colonel L. F. Urwick, 1132
International Review of Cytology (edited by G. H. Bourne and J. F. Danielli), Vol. 2, *review* by Prof. P. B. Medawar, 416
International Rubber Technology Conference : Third (F. A. Jones), 168
International Scientific Film Association : Eighth Annual Congress and Festival of Scientific Films, 432
International Scientific Organizations : Directory of (Unesco), 489
International Scientific Radio Union, 163
International Spectroscopy Colloquium : Fifth (D. M. Smith), 912
International Symposium on the Comparative Endocrinology of Vertebrates, 543
International Symposium on Infra-red Radiation (International Union of Physics, the International Commission for Optics and others), 113
International Symposium on Experimental Meteorology (Swiss Federal Commission for the Study of Hail Formation and Hail Prevention), 589
International Symposium on Peat (Bord na Móna), 20 ; (T. F. Hurley), 483
International Symposium on the Physics of Clouds and Precipitation (Swiss Federal Commission for the Study of Hail Formation and Hail Prevention), 957

International Tin Research Council : Appointment of Dr. Ernest S. Hedges as director, 1172
  Appointment of Dr. W. E. Hoare and W. R. Lewis as assistant directors, 1172
International Union of Biological Sciences : Activities of the, 731
  Symposium on the Biological, Physical and Chemical Characteristics of the Profundal Zone of Lakes, 1136
International Union of Pure and Applied Chemistry : Eighteenth Conference, 588, 777
International Union of Crystallography : Third Congress (Dr. H. Lipson), 378
International Union of Geodesy and Geophysics, 20
International Union of Physics : Conference on Defects in Crystalline Solids, 377
International Union of Physics, and others : International Symposium on Infra-red Radiation, 113
International Union of Pure and Applied Physics and Unesco : Conference on Nuclear and Meson Physics, 530
International West African Conference : Fifth (Prof. L. Dudley Stamp), 21
Interrelationships between a Yeast and a Bacterium when Growing Together in Defined Medium (Dr. S. W. Challinor and A. H. Rose), 877
Intertidal Flora and Fauna of the Chatham Islands (G. A. Knox), 871
Into the Wind (Lord Reith), 759
Intoxications of Cattle : Analysis of Milk in Deficiency Diseases and (Dr. W. T. Binnerts and Prof. E. Brouwer), 974
Intracellular Distribution of Histamine (Dr. I. Mota, W. T. Beraldo, A. G. Ferri and L. C. U. Junqueira), 698
Intracellular Ribonucleases : A Possible Function of (Jay S. Roth), 129
Intracellular Sites of Metabolism of 3 : 4 Benzpyrene in Mouse Liver (G. Calcutt and S. Payne), 841
Intrater, J. (Metzger, M., and) : Sub-Grain Boundary Corrosion in High-Purity Aluminium, 547
Intraventricular Administration of Substance P : Effects of (Prof. U. S. v. Euler and B. Pernow), 184
Invasiveness of Sarcoma Cells (M. Abercrombie and Dr. Joan E. M. Heaysman), 697
Invertebrates : Injurious Effect of Air-saturated Water on certain (Prof. H. Munro Fox and Angela E. R. Taylor), 312
  Oxygen and Haem in (Prof. H. Munro Fox), 355
Iodine-132 Radiation Dosimetry of (E. W. Emery and N. Veall), 889
Iodine Content of Cow's Milk : Goitre and the (Dr. W. T. Binnerts), 973
Iodometric Assay of Penicillinase (C. J. Perret), 1012
Iodoacetates (Aryl) : Histochemical Adaptation of (Dr. John P. Lhotka), 882
Ion Exchange : Analysis by Chromatography and, *review* by E. Q. Laws, 1119
Ion-Exchange Chromatography of Guanidino Amino-acids from Synthetically Modified Gelatin (J. E. Eastoe and A. W. Kenchington), 966
Ion Exchanges in Analytical Chemistry (Prof. Olof Samuelson), *review* by E. Q. Laws, 1119
Ionic Lattice : A Mechanism for the Displacement of Ions in an (J. H. O. Varley), 886
Ionizations : Effect of Haem-linked and other, on Haemoprotein Reactions (Dr. Philip George and Dr. G. I. H. Hanania), 33
Ionized Hydrogen Nebulæ and other Discrete Sources : Radio Observations of, at a Wave-length of 9·4 cm. (F. T. Haddock, C. H. Mayer and R. M. Sloanaker), 176
Ionizing Irradiation : The 'Oxygen-Effect' in (Dr. H. Laser), 753
Ionizing Radiations : Chemical Action of—Excitation of Optical Levels by Particles of Relatively Low Energy (Dr. Joseph Weiss), 78
  Chemical Actions of, on Liquids (Société de Chimie Physique Discussion on), 998
  A Quantitative Biological Test Sensitive to Low Doses of (Dr. H. Marcovich), 796
Ionone Derivatives : Identification of certain 'Ketosteroids' from Cattle Urine as (A. H. Holtz), 316
Ionosphere : Physics of the (Physical Society Conference on), 163, 866
  Thunderstorms and Sporadic *E* Ionization of the (Prof. S. K. Mitra and M. R. Kundu), 798
Ionosphere during the Solar Eclipse of February 25, 1952 (C. M. Minnis), 1137
Ions : Absorption of, by Plants (D. Reichenberg and J. F. Sutcliffe), 1047
Ions (Calcium) : Instability of Milk due to a High Content of (J. Boogaerdt), 884
Ions (Heavy-Metal) : Catalysis of Olefin Autoxidation by, in Non-Polar Media (G. L. Banks, A. J. Chalk, Miss J. E. Dawson and J. F. Smith), 274
Ions (Metal) : Interaction between, through Anions (Ryutaro Tsuchida and Dr. Shoichiro Yamada), 1064
Ions (Silver) : Effect of, on Mitochondrial Adenosine Triphosphatase (J. B. Chappell and G. D. Greville), 930
Ions in an Ionic Lattice : A Mechanism for the Displacement of (J. H. O. Varley), 886
Ions from Platinum : Effect of Vapours of Halogen Compounds on the Emission of Positive (Prof. Nobuji Sasaki and Masaru Oochi), 84
Iron Boro-carbide : A New (K. G. Carroll, L. S. Darken, E. W. Filer and L. Zwell), 978
Iron Objects : Protecting Cleaned (L. Biek, E. S. Cripps and D. M. D. Thacker), 431
Iron and Steel Institute and the Institute of Metals : Symposium on Powder Metallurgy, 432
Iron and Steel Research Association, British : Formation of a Corrosion Advice Bureau, 386
  Work of the London Group Laboratories open for Inspection, 821
Irradiation : Alkoxyglycerols in the Treatment of Leukopenia caused by (Astrid Brohult and John Holmberg), 1102
Irradiation (Ionizing) : The 'Oxygen-Effect' in (Dr. H. Laser), 753
Irradiation of Polyethylene Terephthalate ('Terylene') : Pile (Miss Audrey Todd), 613
Irradiation of Polythene : Electron (A. C. Baskett and C. W. Miller), 364
Irving-Bell, R. : Fertility, 493
Isaac, Peter C. G. : Public Health Engineering, *review* by H. E. W., 1075
Isherwood, F. A., and Cruickshank, D. H. : A New Method for the Colorimetric Estimation of Amino-Acids on Paper Chromatograms, 123
Isle of Man : Occurrence of *Falkenbergia rufolanosa* in the (H. I. Walker, Dr. E. M. Burrows and Dr. S. M. Lodge), 315
Isolated Chloroplasts : Photosynthesis by (Prof. Daniel I. Arnon, Dr. M. B. Allen and Dr. F. R. Whatley), 394
Isolation of *n*-Heptadecanoic Acid from Hydrogenated Mutton Fat (R. P. Hansen, F. B. Shorland and Dr. N. J. Cooke), 39
Isolation of *Keratinomyces ajelloi* from Soils in Great Britain (Dr. Geoffrey Daniels), 224
Isolation of Lignin from Finely Divided Wood with Neutral Solvents (Dr. Anders Björkman), 1057
Isolation from the Lower Respiratory Tract of Chickens of Bacteria administered by Mouth (H. Williams Smith), 45
Isolation of Mucic Acid from Fruits (E. F. L. J. Anet and T. M. Reynolds), 930
Isolation and Characterization of Biosynthetic Arylsulphatase (Dr. K. S. Dodgson, F. A. Rose and Dr. B. Spencer), 599
Isolation and Structure of an *N*-*iso*Butyldienediynamide from Pellitory (*Anacyclus pyrethrum* DC.), (Dr. L. Crombie), 832
Isolation and Structure of Neo-Herculin from *Zanthoxylum clava-herculis* L. (Dr. L. Crombie), 833
Isomers (Aminofluorescein) : A Chromatographic Separation of the (Dr. J. De Repentigny and Dr. A. T. James), 927
Isomers (Two Geometrical) : Enzymatic Conversion of, into Enantiomorphs (W. R. Sistrom and R. Y. Stanier), 513
Isoniazid : Biological Acetylation of (Dr. Willard J. Johnson), 744
Isotope Effect : Chlorine (Rosalie M. Bartholomew, F. Brown and M. Lounsbury), 133
Isotope School, Harwell : Special Course on Autoradiographic Techniques, 589
  Courses on the Techniques of Using and Handling Radioactive Materials, 1172
Isotope Techniques (Atomic Energy Research Establishment, Harwell, Conference on), 67
Isotopes (Radioactive) : Use of, in Small-Mammal Ecology (Gillian K. Godfrey (Mrs. Crowcroft)), 931
Isotopic Exchanges and the Existence of Tricalcium Phosphate in Bone (Dr. J. Govaerts), 831
Isotropic Media : A Modified Wedge Method for exciting Shear Modes in (Dr. B. Ramachandra Rao and P. Venugopala Rao), 835
Israel : Physics in (S. Weintroub), 591
Israeli Scientific Papers during 1948–53 (Exhibition at the Israeli Consulate), 1039
Italian Genetics Society : Formation of an, 910
Italian National Research Council : Exhibition of Geodetical and Geophysical Instruments and Equipment, 20
Italian Text-Book of Zoology, *review*, 478
Iterson, Miss W. van : Possible Relationships between Flagella, Cilia and Sperm Tails, 826
Itoh, Shinji, and Arimura, Akira : Effect of Posterior Pituitary Hormone on the Release of Adrenocorticotrophic Hormone, 37
Ivánovics, Prof. George, and Alföldi, Lewis : A New Antibacterial Principle—Megacine, 465
Ivens, Dr. G. W. : Weed Control, 1179

JACK, D. : Appointed agricultural officer, Tanganyika, 864
Jack, Dr. D. : *Obituary* of Prof. H. Stanley Allen, 108
Jack, J. (Horsley, R. A., and) : Chemistry and Physics of Synthetic Fibres, 117
Jacks, G. V. : Soil, *review* by Dr. A. M. Smith, 809
Jackson, A. (Sayce, L. A., and) : Molecular Spectroscopy, 1166
Jackson, Dr. C. H. N. : Methods for Controlling Tsetse, 542, 1112
Jackson, Dr. H. (Brown, Dr. F., and) : Thyroid Function, 826
Jackson, J. (Morris, G. A., and) : Absorption Towers, *review* by Prof. H. E. Watson, 1072
Jackson, M. C. N. : Human Infertility, 493
Jackson, Dr. R., and others : Paramagnetic Resonance in Carbonaceous Solids, 797
Jackson, R. M. (Alexander, Mrs. F. E. S., and) : Examination of Soil Micro-organisms in their Natural Environment, 750
Jackson, Dr. Willis : Technical Colleges and Industry, 210
  Effects of New Materials on Engineering Progress, 441
  Recruitment in the Engineering Industry in Britain, 637
Jacob, Joseph : Allopolyploidy in the Melaniid Snails, 1061
Jacob, Dr. L. : Fields and Waves in Modern Radio, *review*, 7
  Advances in Electronics, *review*, 287
  Thermionic Valves, *review*, 480
Jacobs, Dr. Morris B., and Scheflan, Dr. Leopold : Chemical Analysis of Industrial Solvents, *review* by C. Whalley, 197
Jacquinot, P. : Atomic Line Spectra, 729
Jaffe (Mr. and Mrs. John) Donation Studentships (Royal Society Awards), 164
Jaffe, Dr. Lionel : Stimulation of the Discharge of Gametangia from a Brown Alga by a Change from Light to Darkness, 743
Jager, L. : Data and Circuits of Television Receiver Valves, *review* by Dr. R. L. Smith-Rose, 99
Jamaica : The Vegetation of (G. F. Asprey and R. G. Robbins), 66
James, Dr. A. T. (De Repentigny, Dr. J., and) : A Chromatographic Separation of the Aminofluorescein Isomers, 927
James, C. G. : Awarded a Research Fellowship in the United States by the National Academy of Sciences, Washington, 1173
James, Dr. E. G. : Germanium and Gallium and their Applications, 627
James, Dr. W. O. : Plant Respiration, *review* by Prof. W. Stiles, 328
Jancke, Gunnar : Awarded a Gold Medal of the Swedish Academy of Engineering Sciences, 955
Janin, J. : Atomic Line Spectra, 731
Janke, Dr. J., and others : Chemistry of Muscle Contraction—Contraction of Muscle without Fission of Adenosine Triphosphate or Creatine Phosphate, 1081
Janmart, J. : The Kalahari Sands of the Lunda (N.E. Angola); their Earlier Redistribution and the Sangoan Culture, *review* by M. C. Burkitt, 331
Jarman, C. G. : Mechanical Separation of Plant Tissues, 890
Järnefelt, H. : Biological, Physical and Chemical Characteristics of the Profundal Zone of Lakes, 1136
Jarrell, K. : Awarded a postgraduate research scholarship by Courtaulds' Scientific and Educational Trust Fund, 492

Jarrett, Dr. A. H.: The Upper Atmosphere, 336
Jay, Mrs. Peggy: Making our Way, 862
Jester, R. S. L.: Weed Control, 1179
Jefferson's (Thomas) Farm Book, with Commentary and Relevant Extracts from other Writings (edited by Edwin Morris Betts), *review* by Sir John Russell, 415
Jellyfish (Freshwater): A Hydropolyp in the Biological Cycle of a (Dr. J. Bouillon), 1112
Jenkins, F. A.: Atomic Line Spectra, 730
Jensen, C. E., and others: Flow Potentials in Hyaluronate Solutions, 1101

Koike, Masahiko (Makino, Dr. Katashi, and) . Competitive Inhibition of Pyridoxal Phosphate Action by Toxopyrimidine Phosphate in the Tyrosine Decarboxylase System, 1056
Kolasiewicz, Anna, and others : Bacterial Antagonism by *Serratia marcescens*, 406
Kolsky, H. : Stress Waves in Solids, *review* by Dr. R. E. D. Bishop, 527
Kon, Dr. S. K. . Promoted to Deputy Chief Scientific Officer in the Scientific Civil Service, 999 , work of, 999
Koninklijk Nederlands Meteorologisch Instituut (1854–1954), 203
Kopech, Gertrude (prepared by Murray, Margaret R., and) : A Bibliography of the Research in Tissue Culture, 1884 to 1950, *review*, 576
Kopfermann, H. : Atomic Line Spectra, 729
Korner, A. : Awarded a Mr. and Mrs. John Jaffe Donation Studentship by the Royal Society, 164
Kornerupine from Rennu, Uttar Pradesh, India (Dr. M. V. N. Murthy), 1065
Kornreich, Dr. E. : Chemistry and Physics of Synthetic Fibres, 117
Korosy, Dr. F. : A Modified Differential Refractometer, 259
Kosswig, Prof. C. : Conservation of Nature in the Near and Middle East, 288
Kothari, Dr. D. S. (Auluck, Dr. F. C., and) : Random Fragmentation, 565
Kotten-Kaye, G. R. : Awarded a postgraduate research scholarship by Courtaulds' Scientific and Educational Trust Fund, 492
Koutecky, Dr. Jaroslav : Methods of Calculation of Polarographic Currents for Depolarization Schemes involving Reactions of Higher Order, 233
Kovács, O., and others Stereochemistry of Cocaine, 131
Kramer, Dr. L. M. J. : Education and Extension Services in Applied Biology, 768
Kramer, Prof. Sol . Succinoxidase Activity of the Flight Muscles of the Wasp, *Sceliphron caementarium*, 43
Krebs, Prof. H. A. Appointed Whitley professor of biochemistry in the University of Oxford, 160 ; work of, 160
  Chemistry in relation to the Development of the Nervous System, 456
  Awarded a Royal Medal for 1954 of the Royal Society, 953, 1031 ; work of, 1031
Krebs, Prof. H. A., and others : Chemistry of Muscle Contraction—Contraction of Muscle without Fission of Adenosine Triphosphate or Creatine Phosphate, 1081
Kreke, Cornelius W., and others : Infra-red and Ultra-violet Absorption Spectra of Proteins in the Solid State, 1144
Kresák, L. : Perturbing Action of the Earth on Meteor Streams, 826
Krishnamurthi M., and Sastry, G. Sivarama : Transition Temperatures of Polymers at Ultrasonic Frequencies, 132
Krishnan, Sir K. S. : Awarded the Padma Vibhushan Dusra Varg (second class) by the President of India on Independence Day, 428
Krotkov, G., and others : Synthesis of Sucrose by Tobacco Leaves, 1038
Küchemann, Dr, D. . Promoted to Senior Principal Scientific Officer in the Scientific Civil Service, 999 ; work of, 999
Kuehner, R. L. : Odour Research, 303
Kuhn, H. G. : Atomic Line Spectra, 730
Kundu, M. R. (Mitra, Prof. S. K., and) : Thunderstorms and Sporadic E Ionization of the Ionosphere, 798
Kunst, E. D. : Molecular Spectroscopy, 1166
Kuplan, L. : Social and Individual Significance of Ageing, 683
Kurti, Dr. N. : Low-Temperature Physics, 772

LARUE, Prof. Carl D., and Narayanaswami, Dr. S. : A New Type of Branching in Liverworts, 313
Labban, F. M. . Effect of Thyroxine on Sexual Behaviour in the Ewe, 933
Laboratory: Archaeology in the (Council for British Archaeology Conference on), 956
  Weighing in the, 1004
Laboratory (School) : Sea-horses in a (A. S. Gillespie), 539
Laboratory Animals Overseas : Legal Protection of, 296
Laboratory Stocks of the Desert Locust, *Schistocerca gregaria* Forsk . An Epizootic among (J. P. Stevenson), 222
Laboratory Weighing (Precise) : Balances, Weights and (National Physical Laboratory Notes on Applied Science, No. 7), 1004
Labour Turnover : Financial Effect of (H. Silcock), 1180 ; (Dr. F. T. Pearce), 1180
Lack, Dr. D. : The Numbers of Man and Animals, 815
Lactating Goat Udder : Synthetic Activity of a Single Epithelial Cell of the (K. C. Richardson and Dr. S. J. Folley), 828
Lactic Acid in Cultures of Lactobacilli : Determination of (Dr. A. John G. Barnett), 649
Lactobacilli : Determination of Lactic Acid in Cultures of (Dr. A. John G. Barnett), 649
Lacy, Dennis : The Golgi Apparatus—Symposium of the Royal Microscopical Society, 21, 727
Lacy, Dennis (Challice, Dr. Cyril E., and) : Fine Structure of Exocrine Cells of the Pancreas, 1150
Ladd, R., and others : New Synthetic Antispasmodics, 231
Lafferty, Dr. H. A. : *Obituary* by Prof. R. McKay, 585
Laing, E. M. : Appointed field geologist, Sierra Leone, 821
Laing, Nigel : Appointed a member of the Advisory Committee on the Protection of Birds for England and Wales, 1086
Laing, P. Gowans, and others : Significance of Metallic Transfer in Orthopaedic Surgery, 834
Laing, W. B. : Honorary Fellowship of Heriot-Watt College, Edinburgh, conferred on, 164
Lajtha, Dr. L. G. : Utilization of Formate-^{14}C for Synthesis of Deoxyribonucleic Acid by Human Bone Marrow Cells *in vitro*, 1013
Lake Chilka : Fisheries of (S. Jones and K. H. Sujansingani), 1131
Lake Tanganyika : A Curious Ecological 'Niche' among the Fishes of (Dr. G. Marlier and N. Leleup), 935
Lake (Great Bitter), Egypt : Variation of the Shells of *Murex tribulus* from the (Dr. Monica Taylor), 1111
Lakes : Biological, Physical and Chemical Characteristics of the Profundal Zone of (International Union of Biological Sciences Symposium on), 1136
Lambers, Dr. D. Hille Ris : Forecasting and Assessment of Plant Diseases, 769
Lambion, R., and others : Oxidative Dissimilation of Glycerol studied with Variants of *Bacillus subtilis*, 37
Lambs (Worm-free) : Production of, at Pasture (C. R. W. Spedding), 611
Lamellar Structure in Higher Plants : Crossed (A. B. Wardrop), 546
Lamont, N. : Appointed a senior agricultural officer, Fiji, 209
Lamontagne, Prof. Maurice : Canada's To-morrow, 212
Lamprey Integument : Permeability to Water of the (M. W. Hardisty), 360
Lancaster Royal Grammar School : The *New Biologian*, 341
Lancisi, Giovanni Maria (1654–1720), (Dr. W. R. Bett), 781
Land-Clearance for Agriculture : Methods of (Agriculture Group of the Society of Chemical Industry Discussion on), 68
Landelout, H., and others : The Immobilization of Mineral Nutrients in Tropical Soils, 23
Landmark in the Theory of Elasticity, *review* by Prof. R. Hill, 713
Landsberg, Dr. Helmut E. : Communication Problems in a Research Operation, 1044
Lane-Petter, W. : Science, Animals and Humanity, 532
Lang, Dr. H. R. (edited by) : *British Journal of Applied Physics*, Vol 4, 1953, and Supplement No. 2, Static Electrification, *review*, 376
Lang-Brown, J. R. : Appointed assistant conservator of forests, Uganda, 821
Langbridge, D. M. : Appointed scientific officer, Nigeria, 864
Langlois-Berthelot, Prof. R. : Electro-Magnetic Machines (translated and revised in collaboration with Lieut.-Colonel H. M. Clarke), *review* by R. Neumann, 988
Langton, H. M. : Organic Chemistry in the Arts and Manufactures, *review*, 419
Lansing, A. I. : Parental Age and Characteristics of the Offspring, 304
Lapinized Rinderpest Virus . Thermal Reactions of Kenya Cattle vaccinated with (G. R. Scott), 44
Lardy, Prof. Henry, and Copenhaver, Jun., J. H. : Efficiency of Oxidative Phosphorylation, 231
Large, E. C. . Forecasting and Assessment of Plant Diseases, 769
Large, Hard or Brittle Specimens : Tape for Microsectioning of Very (Prof. Axel Palmgren), 46
Larvae (Nematode) : The Cuticle of (Alan F. Bird), 362
  The Second Ecdysis of Infective (R. I. Sommerville), 751
Larvae (Trichostrongyle Infective) Size of, in 'Monobacterial' Culture (P. A. G. Wilson), 520
Larval Spot Colours of the Emperor Moth, *Saturnia pavonia* L. : Factors affecting the (D. B. Long), 563
Laser, Dr. H. : The 'Oxygen-Effect' in Ionizing Irradiation, 753
Latin America : Marine Biology in, 1002
  Scientific Institutions and Scientists in, 1, Costa Rica, El Salvador, Guatemala, Honduras, Nicaragua and Panama (Unesco Science Co-operation Office for Latin America), 430
Latner, Dr. A. L. : Nutrition and the Liver, 168
Laue, M. von : Theory of Superconductivity (translated by Lothar Meyer and William Band), *review* by Dr. A. B. Pippard, 376
Laurie, M. V. : Animal Populations and Forestry, 815
  The Interactions between Acid Soils and Forest Trees, 855

Laurmann, E. : *Obituary* by Dr. D. Shoenberg, 1129
Laval University, Quebec : Honorary D.Sc. awarded to Dr. Léo Marion, 1038
Law, E. F. : *Obituary* by Dr. S. W. Smith, 249
Law, Mary E. : Lingual Proprioception in Pig, Dog and Cat, 1107
Law, P. G., and Burstall, T. : Scientific Observations on Heard Island, 1132
Law of Red Shifts and the Distances of Nebulæ (the late Dr. Edwin Hubble), 1046
Lawrence, Dr. G. H. M. : Plant Genera, 71
Lawrence and Moseley Research Fellowship of the Royal Society awarded to Dr. D. S. Robinson, 18
Lawrie, Dr. N. R. : Determination of Adrenocortical Steroids, *review*, 52
  Obituary of Dr. C. G. L. Wolf, 1171
Laws, E. Q. : Analysis by Chromatography and Ion Exchange, *review*, 1119
Laws, Dr. R. M. : Awarded the Dr. W. S. Bruce Memorial Prize for 1954, 113
Lawson, D. I. : Fire and the Atomic Bomb, 586
Lawson, Dr. J. D. : Appointed lecturer in geology at the University of Birmingham, 820
Lawton, R. M. : Appointed assistant conservator of forests, Northern Rhodesia, 864
Layer-Lattice Silicates : Reactions of Molten Salts with (Joe L. White), 799
Le Bouvier, Dr. G. L. : Interference and Cell Protection by Poliomyelitis Virus in Tissue Culture, 649
Le Clerc, J., and others : Influence of Ribonuclease on the Division of Amphibian Eggs, 793
Le Fanu, W. R. (Power, the late Sir D'Arcy, continued by) : Lives of the Fellows of the Royal College of Surgeons of England 1930–1951, *review* by Sir Gordon Gordon-Taylor, 51
Le Fevre, E. J. : Rheology in Mechanical Engineering, 202
Lea, Douglas—Physicist into Biologist (Prof. C. A. Coulson), 432
Lea (Douglas) Memorial Lecture of the Hospital Physicists' Association (Prof. C. A. Coulson), 432
Lea-Wilson, C. P. : New Forms of Thermionic Cathode, 1177
Leach, E. R. : Political Systems of Highland Burma, a Study of Kachin Social Structure, *review* by Prof. S. E. Finer, 423
Leaf Activity : Influence of, on the Composition of the Wood Cell Wall (E. W. J. Phillips), 85
Leaf and Shoot Development : Effect of Shoot Orientation on (J. H. Palmer), 85
Learned Periodical Publications in South Asia : Union Catalogue of (Indian Library Association), Vol. 1, 342
Learning : The World of, 1954, fifth edition, *review*, 1075
Leathem, Dr. J. H. : Comparative Endocrinology of Vertebrates, 543
Leather Trades' Chemists, Society of : Annual Conference, 298
  Sixth Procter Memorial Lecture (Prof. J. T. Randall), 298, 853
Leatherjacket, *Tipula paludosa* : A Second Virus Disease of the (N. Xeros), 562
Leathley, J. A. : Awarded a postgraduate research scholarship by Courtaulds' Scientific and Educational Trust Fund, 492
Leaves : Absorption by, from Nutrient Sprays (G. N. Thorne), 111
  Experiments on the Cause of Dorsiventrality in (I. M. Sussex), 351 ; (R. Snow and Mary Snow), 352
Leaves (Tobacco) : Synthesis of Sucrose by (P. V. Vittorio, G. Krotkov and G. B. Reed), 1038
Leaves (*Vallisneria*) : Transport of Chloride in the 'Symplasm' of (Prof. W. H. Arisz), 223
Lebanese Society of the Friends of the Trees and Unesco Middle East Scientific Co-operation Office : Conference on the Conservation of Nature in the Near and Middle East, 288
Lecithinase in Barley Seedlings : Succinoxidase Inactivation by a (Brian C. Goodwin and E. R. Waygood), 517
Lecithinase (α-Toxin) Production in *Clostridium welchii* (*perfringens*) BP6K : Inhibition by Cystine of (Harry Gooder and Lois Bigger Gehring), 1054
Lecky, T. P. : Appointed chief livestock officer, Jamaica, 821
Lederer, Edgar, and Lederer, Michael : Chromatography, a Review of Principles and Applications, *review*, 5
Lederer, J. : A New Development in Aids for Sub-normal Vision, 977
Lederer, Michael (Lederer, Edgar, and) : Chromatography, a Review of Principles and Applications, *review*, 5
Lederer, Dr. M. (Marini-Bettólo, Prof. G. B., and) : Paper Electrophoresis of Strychnos Alkaloids, 133
Ledoux, L., and others : Influence of Ribonuclease on the Division of Amphibian Eggs, 793
Leete, E., and others : Biogenesis of Hyoscyamine, 650
Lefschetz, Prof. Solomon : Algebraic Geometry, *review* by Dr. L. S. Goddard, 7
Legal Protection of Laboratory Animals Overseas, 296
Leigh, R. S. : The Electronic Band Structure of Solids, 950
Leigh-Dugmore, C. H. : Simplified Particle-size Calculations, 567
Leleup, N. (Marlier, Dr. G., and) : A Curious Ecological 'Niche' among the Fishes of Lake Tanganyika, 935
Lennard-Jones, Sir John : New Ideas in Chemistry, 438
  Death of, 864 ; obituary by Prof. C. A. Coulson, 994
Lenz, F. : Biological, Physical and Chemical Characteristics of the Profundal Zone of Lakes, 1136
Leonardo da Vinci : Onoranze a, nel Quinto Centenario della Nascita, Nos. 1 to 12, *review*, 152
Leone, Prof. E. : Ergothioneine in the Equine Ampullar Secretion, 404
Leopoldina Academy of Natural Sciences, Halle : Election of Prof. K. Mothes as president, 864
Leston, Dennis, and others : Classification of the Terrestrial Heteroptera (Geocorisae), 91
Lethal or other Epistatic Factor : Analysis of Unordered Tetrads Segregating for a (Dr. H. L. K. Whitehouse), 463
Leucopenia caused by Irradiation : Alkoxyglycerols in the Treatment of (Astrid Brohult and John Holmberg), 1102
Levels of Living : Report on International Definition and Measurement of Standards and (United Nations, the International Labour Office and Unesco), 350
Levine, Bernard, and others : A New Mixed Disulphide—Penicillamine-Cysteine, 701
Levine, Dr. P., and others : A Position Effect of the *Rh* Blood-Group Genes, 460
Levisohn, Dr. Ida : Test for the Pseudomycorrhizal Group of Soil Fungi, 408
Levy, Dr. Anthony L. : A Paper Chromatographic Method for the Quantitative Estimation of Amino-Acids, 126
  Obituary by Prof. C. H. Li, 860
Levy, Prof. Hyman : Title of professor emeritus of mathematics in the University of London conferred on, 209
  Retirement from the chair of mathematics at the Imperial College of Science and Technology, 295 ; work of, 295
Levy, M. M., and Marshak, Prof. R. E. : Nuclear and Meson Physics, 530
Lewin, L. (Sim, A. C., and) : Point Source and Sink in a Parallelepiped, 1155
Lewis, Dr. D. : Genetics and the Advancement of Science, 672
Lewis, T. A., and others : Hydrolysis of Methylglucosides, 560
Lewis, W. R. : Appointed an assistant director of the International Tin Research Council and the Tin Research Institute, 1172
Leyton, Dr. L. : The Interactions between Acid Soils and Forest Trees, 857
L'Héritier, Prof. Ph. : Traité de Génétique, *review* by Dr. G. Pontecorvo, 987
Lhotka, Dr. John F. : Histochemical Adaptation of Aryl Iodosoacetates, 882
Li, Prof. C. H. : *Obituary* of Dr. Anthony L. Levy, 860
Liberation of Amino-acids by Plant Roots in relation to Desiccation (H. Katznelson, J. W. Rouatt and T. M. B. Payne), 1110
Librarianship : The Year's Work in (edited by W. A. Munford), Vol. 17, 1950, *review*, 900
Library, National Central : Thirty-eighth Annual Report, 862
Library, National Central, and National Committee on Regional Library Co-operation : Recommendations on Library Co-operation, 916
Library of the Royal Institution, 1799–1954 (K. D. C. Vernon), 242
Library Association : The Year's Work in Librarianship (edited by W. A. Munford), Vol. 17, 1950, *review*, 900
  Annual Meeting, 911
Library Co-operation : Recommendations for (National Central Library and National Committee on Regional Library Co-operation), 916
Library Science, Annals of, Vol. 1, No. 1, 634
Lichtenstein, Dr. N. (Hermann-Hollaender, Eva, and) : Inhibition of D-Amino-acid Oxidase, 559
Liddell, Prof. E. G. T. : Localization of Function in the Adrenal Cortex, 719
Life : Science and, *review* by Prof. F. J. M. Stratton, 665
Life (Everyday) : Science in (Ellsworth S. Obourn, Prof. Elwood D. Heiss and Gaylord C. Montgomery), *review* by Dr. Maurice Ashby, 331
Life and Senses of the Honey Bee, *review* by Dr. W. H. Thorpe, 897
Life-history of the Rat Lung-worm and its Migration through the Brain of its Host (Dr. M. Josephine Mackerras and Dorothea F. Sanders), *erratum*, 164
Lifetimes of Excited States of Atoms : Measurements of, by the Method of Delayed Coincidences (the late S. Heron, R. W. P. McWhirter and Dr. E. H. Rhoderick), 564
Light to Darkness : Stimulation of the Discharge of Gametangia from a Brown Alga by a Change from (Dr. Lionel Jaffe), 743
Light Cages for Birds (Dr. H. Hediger), 142
Light Source for Kohler Illumination (Dr. O. V. S. Heath), 506
Light-induced Œstrus in the Ferret : Effect of Pituitary Stalk Section on (B. T. Donovan and Prof. G. W. Harris), 503
Lignin : Isolation of, from Finely Divided Wood with Neutral Solvents (Dr. Anders Bjorkman), 1057
Limits of the Earth (Fairfield Osborn), *review* by Prof. L. Dudley Stamp, 422
Limons quaternaires du bassin de la Seine—Stratigraphie et archéologie paléolithique (François Bordes), *review* by M. C. Burkitt, 987
Lincoln, Fred : *Obituary* by Sir Lawrence Bragg, 953
Lindahl, Prof. P. E., and Kihlström, J. E. : A Constituent of Male Sperm Antagglutin related to Vitamin E, 600
Lindsay, Donald : Recruitment in the Engineering Industry in Britain, 637
Lindsey, June, and others : Structure of Vitamin B_{12}—X-Ray Crystallographic Evidence on the Structure of Vitamin B_{12}, 1169
Linear Analysis (Prof. Adriaan Cornelis Zaanen), *review* by Dr. F. Smithies, 375
Linear Operators (Dr. Richard G. Cooke), *review* by Dr. F. Smithies, 375
Linggood, F. V., and others : Submerged Culture Production of Diphtheria Toxin, 557
Lingual Proprioception in Pig, Dog and Cat (Mary E. Law), 1107
Linguistic Studies in Polynesia (Prof. S. H. Elbert and Dr. Alexander Spoehr), 471
Linker, Alfred, and Meyer, Dr. Karl : Production of Unsaturated Uronides by Bacterial Hyaluronidases, 1192
Linoleic Acids in the presence of Straight-chain Saturated Fatty Acids : A Chromatographic Method for the Estimation of Oleic and (W. Mary L. Crombie, R. Comber and S. G. Boatman), 181
Linstead, Prof. R. P. : Appointed rector of the Imperial College of Science and Technology, 1130
  Complex Natural Colouring Matters, 990, *erratum*, 1132
Linum usitatissimum Linn. : Inhibition of Vernalization in, by certain Synthetic Hormones (Dr. S. C. Chakravarti), 461
Lipid Component of Reticulin (Dr. K. Little and G. M. Windrum), 789
Lipids (Bound) : Staining of (M. C. Berenbaum), 190
Lipids in Flour—Oxidative Changes induced by Storage and Improver Treatment (Dr. T. Moran, Dr. J. Pace and E. E. McDermott), 449
Lipoids (Nerve) : Local Anæsthetic Potency and Penetration of Monomolecular Layers of (Dr. J. C. Skou), 318
Lipschutz, Prof. A., and others : Antiœstrogenic Potencies of various Progesterone Derivatives with Oxidation at C_{11}, 839
Lipscomb, F. J., and others : Photolysis of Chlorine Dioxide and Absolute Rates of Chlorine Monoxide Reactions, 785
Lipscomb, W. N. : Principles of Atomic and Molecular Structure (Comprehensive Inorganic Chemistry, edited by Prof. M. Cannon Sneed, Prof. J. Lewis Maynard and Prof. Robert C. Brasted, Vol. 1), *review* by Dr. R. Spence, 944
Lipson, Dr. H. : Use of Dimensions in Physics, *review*, 330
  International Union of Crystallography—Third Congress, 378
Lipson, Dr. H., and Cochran, Dr. W. : The Determination of Crystal Structures, *review* by Dr. D. Rogers, 943
Liquid Chlorine : Estimation of Impurities in, by Infra-red Absorption Spectrophotometry (A. W. Pross), 467
Liquid Helium II : Thermodynamics of the Two-Fluid Model of (J. W. Herivel), 322

Liquid Masses : The Stability of Rotating (Dr. R. A. Lyttleton), *review* by Prof. W. H. McCrea, 621
Liquid Propane for Freezing Biological Specimens : Caution in the Use of (Dr. John L. Stephenson), 235
Liquid Substrates (Organic) : Surface Films of Poly-di-methyl Siloxanes on (W. H. Banks), 365
Liquid-State Equation for Normal Paraffins (Arthur K. Doolittle), 369
Liquids : Chemical Actions of Ionizing Radiations on (Société de Chimie Physique Discussion on), 998
Liquids over Solids : Resistance to Flow of, by Thin Films extending from the Edge of Pools or from Menisci (E. B. Bielak, G. F. N. Calderwood and Dr. E. W. J. Mardles), 1009
Lister Medal for 1954 awarded to Victor Ewings Negus, 344
Lithium-7 : Inelastic Scattering of 14-MeV. Neutrons by (D. L. Allan), 267
Little, Dr. K., and Windrum, G. M. : A Lipid Component of Reticulin, 789
Little, Prof. Noel C. : Physics, *review*, 152
Little, W. A. (Birks, Prof. J. B., and) : Cathodoluminescence of Air, Quartz and Metal Films, 82
Littlefield, T. A. : Atomic Line Spectra, 731
Liver : Nutrition and the (Scottish Group of the Nutrition Society Symposium on), 167
Liver (Mouse) : Intracellular Sites of Metabolism of 3 : 4 Benzpyrene in (G. Calcutt and S. Payne), 841
Liver (Rat) : Conversion of Schradan and Parathion by an Enzyme System of (A. N. Davison), 1056
  An Improved Resolution of Cytoplasmic Proteins of, after n-Butanol Treatment (G. Adjutantis), 1054
Liver Extracts (Crude) : Vitamin B_{12} in (F. A. Robinson, M. E. H. Fitzgerald, K. Fehr and J. J. Grimshaw), 558
Liver Fat (Maternal) : Relationship between, and Foetal Weight in Ovine Pregnancy (N. L. Ferguson), 277
Liver Nuclei : Electrophoretic Migration of Contents of Intact (J. St. L. Philpot and J. E. Stanier), 651
Liverworts : A New Type of Branching in (Prof. Carl D. LaRue and Dr. S. Narayanaswami), 313
Livestock Industries of the Commonwealth : John Anderson Gilruth—the Influence of his Life and Work on the Development of the (Sir Ian Clunies-Ross), 1131
Living : Report on International Definition and Measurement of Standards and Levels of (United Nations, the International Labour Office and Unesco), 350
Living Cells : Measurement of the Refractive Index of Cytoplasmic Inclusions in, by the Interference Microscope (K. F. A. Ross), 836
Living Human Eye : Measurement of Rhodopsin in the (Dr. W. A. H. Rushton and Dr. F. W. Campbell), 1096
Living Root-Tip Cells : Effects of Ribonuclease on the Metabolism of (Prof. J. Brachet), 876
Living and Dead Tissues : Measurement of Electrode Potentials in (Dr. D. B. Cater and Dr. A. F. Phillips), 121
Livingstone-Learmonth, Capt. S. T. A. : Appointed a member of the Advisory Committee on the Protection of Birds for England and Wales, 1086
Llewellyn, D. R., and others : Hydrolysis of Methylglucosides, 560
Localization of Embryonic Antigens by Antisera labelled with Fluorescent Dyes (Mrs. R. M. Clayton), 1059
Localization of Function in the Cerebral Cortex (British Association for the Advancement of Science, Section I (Physiology), and the Physiological Society, Discussion on), 718
Loch Trout (*Salmo trutta* L.) : Spawning Migration, Reproduction and Young Stages of (T. A. Stuart), 342
Lochte-Holtgreven, W. : Atomic Line Spectra, 730
Locke Research Fellowships (Royal Society Awards), 1174
Locket, G. H., and Millidge, A. F. : British Spiders, Vol. 2, *review* by T. H. Savory, 100
Lockspeiser, Sir Ben : Elected president of the Council of the European Organization for Nuclear Research, 774 ; work of, 774
Locquin, Dr. Marcel : Electron Optics, 825
  Specimen Techniques in Electron Microscopy, 825
Locust (Desert), *Schistocerca gregaria* Forsk : An Epizootic among Laboratory Stocks of (J. P. Stevenson), 222
Locust Pigmentation : A Possible Endocrine Mechanism controlling (B. Nickerson), 357
Lodge, E. : Awarded a Nature Conservancy Research Studentship in Botany, 727
Lodge, Dr. R. M. : Chemistry and Physics of Synthetic Fibres, 117
Lodge, Dr. S. M. : The Species Concept in relation to the British Flora, 246
Lodge, Dr. S. M., and others : Occurrence of *Falkenbergia rufolanosa* in the Isle of Man, 315
Loewenstein, Dr. J. : Human Infertility, 493
Logan, W. E. M. : Appointed deputy chief conservator of forests, Tanganyika, 492
Logarithmetica Britannica, being a Standard Table of Logarithms to Twenty Decimal Places of the Numbers 10,000 to 100,000 (Dr. Alexander John Thompson), *review* by Dr. J. C. P. Miller, 1028
Loghem, Dr. J. J. van, and others : A Position Effect of the *Rh* Blood-Group Genes, 460
Logic : Alethotropic, a Posthumous Work (Sir Almroth E. Wright), presented by Giles J. Romanes, *review* by Prof. L. P. Garrod, 621
Logical and Mathematical Concepts : Development of—Piaget's Recent Psychological Studies (Dr. W. Mays), 625
London, Prof. F. : *Obituary* by Prof. H. Frohlich, 63
London and Home Counties Regional Advisory Council for Higher Technological Education : Publication No. 18, Applied Research in Technical Colleges, 913
London Hospital Medical College : Appointment of Dr. R. G. White to the University of London readership in bacteriology, 209
London School of Economics and Political Science : Appointment of Dr. M. J. Wise to the Sir Ernest Cassel readership in economic geography, 112
  Title of professor emeritus of sociology in the University of London conferred on Prof. Morris Ginsberg, 209
  Appointment of D. G. MacRae to the University of London readership in sociology, 205
  Appointment of A. D. Knox to the University of London readership in economics with special reference to the economics of underdeveloped countries, 1174
  Title of University of London reader in economics conferred on Dr. A. W. H. Phillips, 1174
Loneragan, Dr. J. F., and Arnon, Prof. Daniel I. : Molybdenum in the Growth and Metabolism of *Chlorella*, 459
Long, D. B. : Factors affecting the Larval Spot Colours of the Emperor Moth, *Saturnia pavonia* L., 563
Long-Range Forces (Specific) : Crystalline Bacterial Arrays and (Dr. R. J. Goldacre), 732
Longhurst, A. R. : Appointed scientific officer, West African Fisheries Research Institute, Sierra Leone, 344
Longitudinal Distribution of Organic Components of Bone (G. Curzon), 646
Longuet-Higgins, M. S. : Microseisms, 302
Lord, Dr. Mary P. (Hodgson, P., and) : Measurement of Eye Movements accompanying Voluntary Head Movements, 75
Loudon, Dr. James D. : Chemistry of Heterocyclic Compounds, *review*, 241
Lounsbury, M., and others : Chlorine Isotope Effect, 133
Lousley, J. E. : The Amateur Botanist in 1954, 70
Lovell, Prof. A. C. B. : The Development and Use of Large Radio Telescopes (Duddell Lecture of the Physical Society), 164
Lovis, J. D. : The Species Concept in relation to the British Flora, 246
Low Absolute Pressures : Measurement of Small Differential Pressures at (D. I. Gaffee and A. G. Monroe), 756
Low Doses of Ionizing Radiations : A Quantitative Biological Test Sensitive to (Dr. H. Marcovich), 796
Low Pressure in the Region of 300 Mc./s. : Artificial Increase of Electrical Breakdown Strength of Air at (G. W. E. Stark and G. L. Fougere), 1066
Low-Current Arcs : The Positive Column of High- and (L. A. King), 1008
Low-Temperature Physics (British Association for the Advancement of Science Conference on), 770
Low-Temperature Sintering of Titanium Dioxide for Ceramic Capacitors (T. V. Ramamurti, C. V. Ganapathy and Shiv Saran), 1187
Low Temperatures : Properties of Materials at (International Institute of Refrigeration, Bulletin Annexe 1954-2), 297
Lowe, Frank A. : The Heron, *review* by Frances Pitt, 376
Lowenthal, Prof. Julius : Enzymatic Conversion of Salicylhydroxamic Acid to Salicylamide, 36
Lower Tertiary Foraminifera of the Qatar Peninsula (Dr. Alan Hilder Smout), *review*, 945
Lowry, Dr. O. H. : Chemistry in relation to the Development of the Nervous System, 456
Loyalty, Dissent : Freedom, (Prof. Henry Steele Commager), *review* by R. Brightman, 942
Lucerne Protein Concentrates, fed with and without Cholesterol : Nutritive Value of (S. J. Cowlishaw, D. E. Eyles, W. F. Raymond and J. M. A. Tilley), 227
Lucy, J. A., and Butler, Prof. J. A. V. : Fractionation of Deoxyribonucleoprotein by Successive Extraction with Constant Salt Concentration, 32
Ludford, Dr. R. J. : The Golgi Apparatus, 22
Ludlam, F. H. : Physics of Clouds and Precipitation, 958
Lugg, Prof. J. W. H., and Bowness, Dr. J. M. : Renal Excretion of 17-Ketosteroids by Members of some Ethnic Groups living in Malaya, 1147
Luminescence and the Scintillation Counter (Dr. S. C. Curran), *review* by Dr. Ernst Breitenberger, 239
Lunda (N.E. Angola) : The Kalahari Sands of the—their Earlier Redistribution and the Sangoan Culture (J. Janmart), *review* by M. C. Burkitt, 331
Lundy Field Society : Seventh Annual Report, 385
Lung : Photographs of Serial Sections of the, projected rapidly in Sequence using 16-mm. Film (Dr. Brian E. Heard), 319
Lungs of the Mole (*Talpa europaea*) : Occurrence of *Haplosporangium parvum* in the (Dr. A. McDiarmid and P. K. C. Austwick), 843
Lungworm (Rat) : Life-history of the, and its Migration through the Brain of its Host (Dr. M. Josephine Mackerras and Dorothea F. Sandars), *erratum*, 164
Lungworms (*Metastrongylus* spp.) in Pigs, and their Development in the Guinea Pig (Dr. Diana Rowan Dunn and Prof. E. G. White), 1193
Luomala, Prof. Katharine : Ethnobotany of the Gilbert Islands, 679
Lüther, H. : Molecular Spectroscopy, 1166
Luttrell, W. F. : Pitfalls in the Collection of Data from Firms, 501
Lutwak-Mann, Dr. Cecilia : Fertility, 493
Lymphatic Tissue : Abdominal, as a Source of Hyperglycaemic Glycogenolytic Factor (M. R. Raja Rama Rao and Dr. N. N. De), 229
Lynch, A. C. : Ferroelectric Properties of Single Crystals, 1093
Lynen, Prof. F. : Participation of Coenzyme A in the Oxidation of Fat, 962
Lyon, Mary F., and others : Partial Sex Linkage in the Mouse, 339
Lysenko, T. D. : Agrobiology, translated from the fourth Russian edition, *review* by Dr. E. Ashby, 148
Lysenko in Perspective, *review* by Dr. E. Ashby, 148
Lyttleton, Dr. R. A. : The Stability of Rotating Liquid Masses, *review* by Prof. W. H. McCrea, 621

MCAULAY, Prof. A. L., and Scott, B. I. H. : A New Approach to the Study of Electric Fields produced by Growing Roots, 924
Maccabaeans, Society of : Meldola Medal for 1955, 998
McCallien, Prof. W. J. (Bailey, Sir Edward, and) : External Metasomatism associated with Serpentine, 836
McCarthy, Dr. E. F. : Recent Advances in Electrophoretic Technique, 591
McConnell, Prof. James (edited by) : Selected Papers of Arthur William Conway, *review* by Prof. H. T. H. Piaggio, 479
McCrea, Prof. W. H. : Rotating Liquid Masses, *review*, 621
  De Broglie on Quantum Theory, *review*, 762
  Cosmic Evolution, *review*, 852
McCready, Dr. C. C. (Hewitt, Dr. E. J., and) : Relation of Nitrogen Supply to the Molybdenum Requirement of Tomato Plants grown in Sand Culture, 186
McCulloch, J. : Appointed deputy director of veterinary services, Northern Region, Nigeria, 492, 864

McDermott, E. E., and others: The Lipids in Flour—Oxidative Changes induced by Storage and Improver Treatment, 449

Marshall, J. (Marshall, L., and) : Direction of Polarization of Proton Spin produced by Elastic Scattering, 1184
Marshall, L., and Marshall, J. : Direction of Polarization of Proton Spin produced by Elastic Scattering, 1184
Marshall, W. A., and others : Effect of Cervical Sympathectomy on the Onset of Œstrus in Ferrets, 311
Marshes of the Medway Estuary in Romano-British Times (Surg.-Comdr. H. M. Darlow and Surg.-Comdr. P. H. K. Gray), 90 ; (I. Noël Hume), 91
Marston, A. T. : The Piltdown Bones and 'Implements', 61
Marsupial 'Tiger Cat' (Ellis Troughton), 163
Martin, Dr. A. E. : Infrared Absorption Spectra of Steroids, *review*, 945
Martin, A. S. : Appointed assistant bacteriologist, Jamaica, 209
Martin, B. F. : Serous Cells in Brunner's Glands of the Rabbit, 1195
Martin, Geoffrey : Industrial and Manufacturing Chemistry, Part I, Organic, seventh edition revised by Edward I. Cooke, *review* by H. M. Langton, 419
Martin, Dr. Hubert : Crop Protection, 769
Martin, K. V., and others : New Synthetic Antispasmodics, 231
Martin, Paul S., and others : Cave Sites of the Mogollon Culture in New Mexico, 997
Martin, R P., and Russell, R. Scott : Radioactive Tracers in Plant Nutrition, 284
Martin, S. M. (Ramakrishnan, C. V., and) : Inhibition of the 'Condensing Enzyme' of *Aspergillus niger* by Magnesium, 230
Marton, L. (edited by) : Advances in Electronics, Vol 5, *review* by Dr. L Jacob, 287
Martyn, D. F. : The Physics of the Ionosphere, 866
Masing, Dr. Georg : To be presented with the Platinum Medal of the Institute of Metals, 113
Mason, Mrs. Betty, and Gilbert, Owen : Presence of a Peritrophic Membrane in Diplopoda, 1022
Mason, B. J. : Bursting of Air Bubbles at the Surface of Sea Water, 470
Physics of Clouds and Precipitation, 957
Mason, D. T. (Vince, Dr. D., and) : Acceleration of Flowering in Non-vernalized Chrysanthemums by the Removal of Apical Sections of the Stem, 842
Mason, Dr. H. L. : Plant Genera, 71
Mass Communication, Power and Influence, 709
Mass Spectrometry : Qualitative Analysis of Organic Compounds by (J. H. Beynon), 735
Mass Transport in Tubes : Diffusion and (Sir Geoffrey Taylor), 113
Massachusetts Institute of Technology : Scholarships in Science, Technology and Architecture, 1040
Massachusetts Institute of Technology (members of the Staff of the Radar School) : Principles of Radar, third edition by Prof. J. Francis Reintjes and Godfrey T. Coate, *review*, 7
Massee, Dr. A. M. : Effect of Insecticides on the Balance of Animal Populations, 541
Massey, Prof. H. S. W. : Elected president for 1954–55 of the Physical Society, 120
Nuclear and Meson Physics, 530
Mast-Cell Tumours from Dogs : Heparin and Histamine in (Rosemary Cass, J. F. Riley, Dr. G. B. West, K. W. Head and S. W. Stroud), 318
Materials (New) : Effects of, on Engineering Progress (Dr. Willis Jackson), 441
Materials at Low Temperatures : Properties of (International Institute of Refrigeration, Bulletin Annexe 1954–2), 297
Maternal Effect on Birth Weight in South Devon × Dexter Cattle Crosses (D M. Joubert and Dr. John Hammond), 647
Maternal Liver Fat and Foetal Weight : Relationship between, in Ovine Pregnancy (N. L. Ferguson), 277
Mathematical Concepts : Development of Logical and—Piaget's Recent Psychological Studies (Dr W. Mays), 625
Mathematical Theory of Elasticity : Some Basic Problems of the (N. I. Muskhelishvili), translated from the Russian by J. R. M. Radok, third edition, *review* by Prof R. Hill, 713
Mathematics : Pure, at Birmingham, 953
Mathematics at the Imperial College of Science and Technology, 295
Mathematics in Action (Prof. O. G. Sutton), *review* by Prof. L. Rosenhead, 4
Mathematics and Physics Societies of Yugoslavia : Federation of—Congress in Zagreb (Stevan Dedijer), 1179
Mather, Prof. K. : Age of Parent and Character of Offspring, 304
Genetics in relation to other Biological Sciences, 672
Fundamental Science in Agricultural Research, with special reference to the Development of Genetics (Second Middleton Memorial Lecture), 998
Mating : Conception in Prepuberal Mice following Artificially Induced Ovulation and (Meredith N. Runner and Allen Gates), 222
Matsushita, S. : The Physics of the Ionosphere, 867
Matter : Properties of (H. N. V. Temperley), *review* by G. R Noakes, 1120
Matthews, A. C., and others : Submerged Culture Production of Diphtheria Toxin, 557
Matthews, Dr. L. Harrison : Monkeys as Pets, *review*, 418
Comparative Endocrinology of Vertebrates, 543
Research on the Mammals of Africa, 670
Matthias, Dr. B. T. : Ferroelectric Properties of Single Crystals, 1092
Matty, Dr. A. J. : To receive an award under the Commonwealth Bursaries Scheme of the Royal Society and Nuffield Foundation, 1086
Maugham-Brown, H. M. : Appointed conservator of forests, Tanganyika, 821
Mauritius : Occurrence of *Culex simpsoni* in (James G. Halcrow), 466
Mauritzen, Dr. C. M., and others : Abnormal Properties of Histones from Malignant Cells, 580
Mawson, C. A., and others : Influence of Ethylenediamine-tetra-acetic Acid on the Excretion of Zinc by the Rat, 881
Maximum of the Planck Energy Spectrum (R. N. Bracewell), 563
Maxwell, J. L. : Appointed agricultural officer, Nyasaland, 864
May, E. B. : Appointed agronomist, West African Institute for Oil Palm Research, Nigeria, 821
May, K. R (Druett, H. A., and) : Production of Individual, Sized, Droplets by High-Voltage 'Firing' from a Micropipette, 467
Mayer, C. H., and others : Radio Observations of Ionized Hydrogen Nebulae and other Discrete Sources at a Wave-length of 9·4 cm., 176
Maynard, Prof. J. Lewis, and others (edited by) : Comprehensive Inorganic Chemistry, Vol. 1, Principles of Atomic and Molecular Structure (W. N. Lipscomb), Theoretical and Applied Nuclear Chemistry (P. R. O'Connor), The Actinide Series (G. T. Seaborg), *review* by Dr. R. Spence, 944
Mayneord, Prof. W. V., and others : The Radon Content of the Atmosphere, 424
Mays, Dr. W. : Development of Logical and Mathematical Concepts—Piaget's Recent Psychological Studies, 625
Meacock, Dr. G : Chemistry and Physics of Synthetic Fibres, 117
Meade, Dr. B. W., and Maclagan, Prof. N. F. : Thyroid Function, 826
Measurement of Colour : Principles of the, *review* by Dr. L. C. Thomson, 666
Measurement of Electrode Potentials in Living and Dead Tissues (Dr. D. B. Cater and Dr. A. F. Phillips), 121
Measurement of Eye Movements accompanying Voluntary Head Movements (F. Hodgson and Dr. Mary P. Lord), 75
Measurement of the Particle-size Characteristics of Fine Powders (Course by Dr. H. E. Rose in the Faculty of Engineering, King's College, London), 298
Measurement of the Refractive Index of Cytoplasmic Inclusions in Living Cells by the Interference Microscope (K. F. A. Ross), 836
Measurement of Rhodopsin in the Living Human Eye (Dr. W. A. H. Rushton and Dr. F. W. Campbell), 1096
Measurement of Small Differential Pressures at Low Absolute Pressures (D I. Gaffee and A. G. Monroe), 756
Measurement of Standards and Levels of Living : Report on International Definition and (United Nations, the International Labour Office and Unesco), 350
Measurements of Age by the Carbon-14 Technique (Prof. Hl. de Vries and G. W. Barendsen), 1138
Measurements of Lifetimes of Excited States of Atoms by the Method of Delayed Coincidences (the late S. Heron, R. W. P. McWhirter and Dr. E. H. Rhoderick), 564
Measurements on the Neutron Multiplication in a System of Uranium Rods and Ordinary Water (Rolf Persson), 265, *erratum*, 636
Mécanique ondulatoire : Les applications de la, à l'étude de la structure des molécules (Réunions d'études et de mises au point tenues sous la présidence de Louis de Broglie), *review* by S. Weintroub, 989
Mechanical Effects of Dislocations in Crystals (Conference at the University of Birmingham), 377

Mechanical Engineering: Rheology in (British Society of Rheology Conference on), 201
Mechanical Engineers, Institution of: Nineteenth Parsons Memorial Lecture (F. Dollin), 681
Mechanical Separation of Plant Tissues (C. G. Jarman), 893
Mechanical Vibration: Introduction to a Study of (G. W. Van Santen), *review* by Dr. K. M. Entwistle, 1029
Mechanics (Geometrical), and de Broglie Waves (Prof. J. L. Synge), *review* by Dr. Abdus Salam, 900
Mechanics (Statistical): An Introduction to Thermodynamics, the Kinetic Theory of Gases, and (Prof. Francis Weston Sears), second edition, *review* by R. W. Haywood, 240
Mechanism of Disease Resistance: Adventitious-Root Formation by Fungal Pathogen Metabolites as a Possible (Prof. M. A. Mostafa), 86
Mechanism for the Displacement of Ions in an Ionic Lattice (J. H. O. Varley), 886
Mechanism of Economic Systems (Prof. Arnold Tustin), *review* by Prof. G. L. S. Shackle, 421
Mechanism of the Formation of Red Melanin in the Silkworm (Kaoru Inagami), 1105
Mechanism of Hypotensive Action of Reserpine, an Alkaloid of *Rauwolfia serpentina* (Dr. E. G. McQueen, Dr. A. E. Doyle and Dr. F. H. Smirk), 1015
Mechanism of Oxidative Phosphorylation: Reversal and (Prof. P. D. Boyer, A. B. Falcone and W. H. Harrison), 401
Mechanisms (Basic): Physical and Chemical Aspects of, in Radiobiology (Proceedings of an Informal Conference held at Highland Park, Illinois, 1953, edited by John L. Magee, Martin D. Kamen and Robert L. Platzman), 389
Medawar, Prof. P. B.: Modern Cytology, *review*, 416
Media (Chemically Defined): Cultivation of *Pasteurella tularensis* in—Effect of Buffers and Spermine (Dr. J. Mager, A. Traub and N. Grossowicz), 747
Medical Research Council: Appointment of Prof. A. Bradford Hill, Prof. G. F. Marrian, Prof. G. W. Pickering and the Hon. Richard Frederick Wood, as members, 636
  Steroid Reference Collection, 678
  Gift of a recurrent grant of £800 a year to the Department of Experimental Pathology and Cancer Research, University of Leeds, for research into the possible carcinogenic fractions from tobacco tar, 863
Medical Sciences, British Abstracts of, 340
Medicine: Occupational, in Finland, 491
Medium (Defined): Interrelationships between a Yeast and a Bacterium when Growing Together in (Dr. S. W. Challinor and A. H. Rose), 877
Medusae: British, *review* by Prof. T. A. Stephenson, 151
Medusae of the British Isles (Frederick Stratton Russell), *review* by Prof. T. A. Stephenson, 151
Medway Estuary in Romano-British Times: The Marshes of the (Surg.-Comdr. H. M. Darlow and Surg.-Comdr. P. H. K. Gray), 90; (I. Noël Hume), 91
Mees, Dr. C. E. Kenneth: Awarded the Franklin Medal of the Franklin Institute, Philadelphia, 910
Meester, J.: Research on the Mammals of South Africa, 1149
Megacine: A New Antibacterial Principle—(Prof. George Ivánovics and Lewis Alföldi), 465
Megalith Builders: The Art of the (Dr. Glyn Daniels), 69
Meggers, W. F.: Atomic Line Spectra, 730
Meggy, Dr. A. B.: Chemistry and Physics of Synthetic Fibres, 116
Meiring, Prof. A. J. D.: Obituary of Prof. T. P. Dreyer, 485
Meissner, K. W.: Atomic Line Spectra, 729
Melanoid Snails: Allopolyploidy in the (Joseph Jacob), 1061
Melanin in the Silkworm: Mechanism of the Formation of Red (Kaoru Inagami), 1105
Melanins: A Comparison of some Natural and Synthetic (W. D. Stein), 601
Melanophore-expanding Hormone Preparations from Beef Pituitary Glands: Adrenocorticotrophic Activity of (Dr. B. G. Benfey, Dr. M. Saffran and A. V. Schally), 1106
Meldola Medal for 1955 of the Society of Maccabaeans, 998
Mellon Institute, Pittsburgh: Scientific Research of, 1953–1954, 496
Melloni, Macedonio: International Symposium on Infra-red Radiation at the University of Parma to commemorate the hundredth anniversary of the death of, 113
Melman, Seymour: Survey of Industry, Trade and Finance, 350
Melville, Prof. H. W.: Theory of Synthetic Polymers, *review*, 52
Melville, Prof. H. W., and others: Synthesis of Branched Polymers, 78
Melville, Dr. R.: The Species Concept in relation to the British Flora, 246
Melville, R. V.: Treatise of Palaeontology, *review*, 329
Men: Rats, Mice and, *review* by S. A. Barnett, 1118
Men of Cambridge, *review* by Prof. F. J. M. Stratton, 896
Mendelssohn, Dr. K.: Superconductivity, *review*, 477
  Low-Temperature Physics, 770
  Below 1° K, *review*, 810
Menisci: Resistance to Flow of Liquids over Solids by Thin Films extending from the Edge of Pools or from (E. B. Bielak, G. F. N. Calderwood and Dr. E. W. J. Mardles), 1009
Mental Health Research Fund: First International Neurochemical Symposium (Chemistry in relation to the Development of the Nervous System), 455
Menter, Dr. J. W.: Chemistry and Physics of Synthetic Fibres, 117
Mer, C. L.: Growth of Wounded Etiolated *Avena* Seedlings, 680
Mercerized Celluloses: Structures of Native and (Dr. J. O. Warwicker), 135; (H. J. Wellard), 135; (H. J. Woods), 136
Mercurated Thiazoles as Fungistatic Agents: Use of (Dr. M. K. Rout, B. Padhi and N. K. Das), 516
Mercury against a Moving Tungsten Wire: Angle of Contact of (A. H. Cook and N. W. B. Stone), 366
Meredith, R.: Awarded the Warner Memorial Medal of the Textile Institute, 636
Merrett, F. M., and others: Synthetic Rubbers, 169
Meson Physics (Prof. Robert E. Marshak), *review* by Dr. G. D. Rochester, 97
Meson Physics: Nuclear and (International Union of Pure and Applied Physics and Unesco Conference on), 530
Mesons, a Summary of Experimental Facts (Alan M. Thorndike), *review* by Dr. G. D. Rochester, 97
Messel Memorial Lecture to the Society of Chemical Industry (Lord Cherwell), 349
Meta-physiology ? Physiology or, *review* by J. R. Bendall, 477
Metabolism (Mycobacterial): Metaphosphate in (Frank Winder and Joan M. Denneny), 353
Metabolism of 3:4 Benzpyrene in Mouse Liver: Intracellular Sites of (G. Calcutt and S. Payne), 841
Metabolism of *Chlorella*: Molybdenum in the Growth and (Dr. J. F. Loneragan and Prof. Daniel I. Arnon), 459
Metabolism of Elastin in the Adult Rat (H. G. B. Slack), 512
Metabolism of Living Root-Tip Cells: Effects of Ribonuclease on the (Prof. J. Brachet), 876
Metabolism in Potatoes: Manganese and (H. C. Ruck and B. D. Bolas), 726
Metabolism and the Occurrence of $d(-)$Glutamic Acid in Tumour Proteins (Dr. Gunther Hillmann, Anneliese Hillmann-Elies and Friedrich Methfessel), 403
Metabolites (Fungal Pathogen): Adventitious-Root Formation by, as a Possible Mechanism of Disease Resistance (Prof. M. A. Mostafa), 86
Metal: The Rarer, Zirconium, *review* by H. W. Greenwood, 286
Metal Catalysis (Heavy): Effect of Chelating Agents on (A. J. Chalk and J. F. Smith), 802
Metal Complexes: Electronegativity and the Stability of (Dr. D. Chapman), 887
Metal Films: Cathodoluminescence of Air, Quartz and (Prof. J. B. Birks and W. A. Little), 82
Metal Ions: Interaction between, through Anions (Ryutaro Tsuchida and Dr. Shoichiro Yamada), 1064
Metallic Transfer in Orthopaedic Surgery: Significance of (Dr. F. P. Bowden, J. B. P. Williamson and P. Gowans Laing), 834
Metallurgists, Institution of: Microscopy of Metals, 997
Metallurgy: Powder (Iron and Steel Institute and the Institute of Metals Symposium on), 432
  A Text-book of (A. R. Bailey), *review* by Dr. R. W. K. Honeycombe, 376
Metallurgy of Chromium, *review* by Dr. W. Hume-Rothery, 422
Metals: Chemisorption on (M. McD. Baker and Sir Eric Rideal), 1185
  Microscopy of (Institution of Metallurgists), 997
  Physical Chemistry of (Dr. Lawrence S. Darken and Dr. Robert W. Gurry), *review* by Prof. F. C. Thompson, 624
  Structure and Texture of (X-Ray Analysis Group of the Institute of Physics Conference on), 298
Metals, Institute of: Autumn Meeting in Switzerland, 113
  Platinum Medal to be presented to Dr. Georg Masing, 113
  Journal of the (edited by N. B. Vaughan), Vol. 80, 1951–52, *review* by Dr. W. Hume-Rothery, 576
  Election of H. S. Tasker as a Fellow, 589
Metals, Institute of (Iron and Steel Institute and the): Symposium on Powder Metallurgy, 432
Metaphosphate in Mycobacterial Metabolism (Frank Winder and Joan M. Denneny), 353
Metasomatism associated with Serpentine: External (Sir Edward Bailey and Prof. W. J. McCallien), 836
Metastrongylus spp. (Lungworms) in Pigs, and their Development in the Guinea Pig (Dr. Diana Rowan Dunn and Prof. E. G. White), 1193
Metcalf, J. R.: Appointed lecturer in mining at the University of Sheffield, 113
Metcalfe, Dr. George, and Chayen, Sonja: Nitrogen Fixation by Soil Yeasts, 841
Meteor Streams: Perturbing Action of the Earth on (L. Kresak), 826
Meteorites Found in Australia: Two, 65
Meteoritics, a New Journal, 252
Meteorological Society, Royal: Election of Officers, 67
  Symposium on the Upper Atmosphere, 334, *erratum*, 492
  Symposium on Meteorology and Scottish Agriculture, 493
Meteorological Society (Royal), in conjunction with the Council for the Promotion of Field Studies: Vacation Course in Synoptic Meteorology, 633
Meteorologische Gesellschaft, Hamburg: Meeting in honour of the centenary of the birth of G. Hellmann, 589
Meteorology (Experimental): International Symposium on (Swiss Federal Commission for the Study of Hail Formation and Hail Prevention), 589
Meteorology (Synoptic): Vacation Course in (Royal Meteorological Society in conjunction with the Council for the Promotion of Field Studies), 633
Meteorology and Scottish Agriculture (Royal Meteorological Society Symposium on), 493
Methane, Silane and Germane: Bond-Lengths and Force Constants for (R. A. Ballinger and N. H. March), 179
Methfessel, Friedrich, and others: Metabolism and the Occurrence of $d(-)$Glutamic Acid in Tumour Proteins, 403
Methonium Compounds: Development of Tolerance to Ganglion Blockade by (Dr. J. K. Mohanty), 184
Methyl-Cyanoacetylene: Microwave Spectrum of (Dr. J. Sheridan and Dr. L. F. Thomas), 798
(±) Methyl Fluoromalate: Synthesis of (N. F. Taylor and Dr. P. W. Kent), 401
4-Methyl-1:2-Benzanthracene: A Novel Synthesis of (O. P. Vig, S. V. Kessar and Prof. S. M. Mukherji), 834
γ-Methyleneglutamic Acid: Enzymic Decarboxylation of, by Plant Extracts (Dr. L. Fowden), 208
γ-Methyleneglutamic Acid and γ-Methyleneglutamine: Synthesis of (Dr. P. Wailes, M. C. Whiting and Dr. L. Fowden), 130
γ-Methyleneglutamine: Synthesis of γ-Methyleneglutamic Acid and (Dr. P. Wailes, M. C. Whiting and Dr. L. Fowden), 130
Methylglucosides: Hydrolysis of (Dr. C. A. Bunton, T. A. Lewis, D. R. Llewellyn, H. Tristram and C. A. Vernon), 560
Metzger, M., and Intrater, J.: Sub-Grain Boundary Corrosion in High-Purity Aluminium, 547
Mexico: Veterinary Research in, by the University of Pennsylvania, 954
Meyer, J., and others: The Immobilization of Mineral Nutrients in Tropical Soils, 23
Meyer, Dr. Karl (Linker, Alfred, and): Production of Unsaturated Uronides by Bacterial Hyaluronidases, 1192

Meyer-Doring, Dr. Hans : Chemotherapeutic Experiments with Natural Constituents of the Body, 555
Meyrick, T. J. (Coffey, D. H., and) : Synthetic Rubbers, 169
Mice : Control of Rats and (edited by Dennis Chitty and H. N. Southern), Vol. 1, Rats ; Vol. 2, Rats ; Vol. 3, House Mice, *review* by S. A. Barnett, 1118
  Inability of Acetylcholine Antagonists to protect, against the Toxicity of 'Tensilon' (M. W. Parkes and P. Sacra), 969
Mice (Prepuberal) : Conception in, following Artificially Induced Ovulation and Mating (Meredith N. Runner and Allen Gates), 222
Mice (Unborn) : Transmigration of (Anne McLaren and Donald Michie), 844
Mice given Total Body X-Irradiation : Protective Effect of *d,l*-α-Octadecylglycerolether in (T. Edlund), 1102
Mice and Men : Rats, *review* by S. A. Barnett, 1118
Michie, Donald (McLaren, Anne, and) : Current Trends of Genetical Research in Hungary, 390
  Transmigration of Unborn Mice, 844
Micks, Dr. Don W. : Paper Chromatography as a Tool for Mosquito Taxonomy—The *Culex pipiens* Complex, 217
Microbiology : Perspectives and Horizons in (Symposium at the Institute of Microbiology, Rutgers University), 105
Microbiology (General), Society for : Reorganization and establishment of a Central Office, 342
Microchemical Balances : Riderless (Dr. T. S. West), 731
Microfibrils (Cellulose) : Electron Diffraction Diagrams of, in *Valonia* (Prof. R. D. Preston and G. W. Ripley), 76
Micro-fungal Population of Acid Sandy Podsols (Dr. Ethel I. McLennan and Sophie C. Ducker), 1060
Micro-organisms : The Wet-film Indian Ink Method for examining (Dr. J. Rishbeth), 361
Micro-organisms (Soil) : Examination of, in their Natural Environment (Mrs. F. E. S. Alexander and R. M. Jackson), 750
Micropipette : Production of Individual, Sized, Droplets by High-Voltage 'Firing' from a (H. A. Druett and K. R. May), 467
Microscope (Interference) : Measurement of the Refractive Index of Cytoplasmic Inclusions in Living Cells by the (K. F. A. Ross), 836
Microscope (Polarizing) : Manual of the (Dr. A. F. Hallimond), second edition, *review* by Dr. M. H. Hey, 669
Microscope in Industry and Research (W. Watson and Sons, Ltd., Exhibition on the), 386
Microscopic Fibres : Photoelastic Effects in (A. J. Cruise), 923
Microscopical Society, Royal : Symposium on the Golgi Apparatus, 21, 727
  Proceedings of the International Conference on Electron Microscopy, London 1954, 826
Microscopie Électronique : Comptes rendus du Premier Congrès International de, Paris, 14–22 Septembre 1950, *review* by Dr. V. E. Cosslett, 330
Microscopy : Direct, for Study and Count of Soil Protozoa (Y. T. Tchan and J. S. Bunt), 656
Microscopy of Metals (Institution of Metallurgists), 997
Microsectioning of Very Large, Hard or Brittle Specimens : Tape for (Prof. Axel Palmgren), 46
Microseisms (Office of Naval Research and the Geophysical Research Division of the United States Air Force Symposium on), 302
Microtitration Method : A Simple, for the Determination of Calcium and Magnesium in the Hæmolymph of Insects (Dr. K. van Asperen and Ida van Esch), 927
Microwave Spectrum of Methyl-Cyanoacetylene (Dr. J. Sheridan and Dr. L. F. Thomas), 798
Middle East (Near and) : Conservation of Nature in the (Lebanese Society of the Friends of the Trees and Unesco Middle East Science Co-operation Office Conference on), 289
  Nature Protection in the (Lieut.-Colonel C. L. Boyle), 288
Middleton, Dr. John : Beliefs and Society, *review*, 715
Middleton Memorial Lecture (Prof. K. Mather), 998
Migration through the Brain of its Host : Life-history of the Rat Lungworm and its (Dr. M. Josephine Mackerras and Dorothea F. Sandars), erratum, 164
Migration of Contents of Intact Liver Nuclei : Electrophoretic (J. St. L. Philpot and J. E. Stanier), 651
Migration Method in Paper Chromatography : Modified Horizontal (N. C. Ganguli), 189
Mijeti Game Reserve, 587
Miles, P. A. : Ferromagnetic Resonance in Ferrites, 177
Military College of Science (Royal), Shrivenham : Appointment of Prof. S. J. Davies as dean, 727
Milk : Instability of, due to a High Content of Calcium Ions (J. Boogaerdt), 884
Milk (Artificial Human) : The Rat as a Test Animal in evaluating, for Infants (Prof. Paavo Roine, Helge Gyllenberg, Marjatta Rossander and Rita Vuokila), 519
Milk (Cow's) : Goitre and the Iodine Content of (Dr. W. T. Binnerts), 973
Milk in Deficiency Diseases and Intoxications of Cattle : Analysis of (Dr. W. T. Binnerts and Prof. E. Brouwer), 974
Milk and Milk Products : Bacteriology of (Society for Applied Bacteriology Discussion on), 1135
Milk Products : Bacteriology of Milk and (Society for Applied Bacteriology Discussion on), 1135
Milkweed Bugs : Corpus allatum and Egg Production in Starved (A. S. Johansson), 89
Miller, M. J., and others : Influence of Ethylenediamine-tetra-acetic Acid on the Excretion of Zinc by the Rat, 881
Millard, D. J. : Heats of Reaction during Carbonization as deduced from Temperature Surveys of a Coke Oven, 1099
Miller, C. W. (Baskett, A. C., and) : Electron Irradiation of Polythene, 364
Miller, David M. (Morrison, Dr. John L., and) : Alternation in the Adsorption of Aliphatic Acids on Porous Carbon, 1188
Miller, Dr. G. L. : Zirconium, *review* by H. W. Greenwood, 286
Miller, Dr. J. C. P. : Logarithmetica Britannica, *review*, 1028
Miller, Dr. J. C. P. (prepared for the Mathematical Tables Committees of the British Association and the Royal Society under the editorship of) : Table of Binomial Coefficients, *review* by J. H. Pearce, 1075
Miller, Dr. M. R. : Comparative Endocrinology of Vertebrates, 543
Miller, Walter J., and Saidla, Leo E. A. (edited by) : Engineers as Writers, *review* by R. H. Macmillan, 622
Millidge, A. F. (Locket, G. H., and) : British Spiders, Vol. 2, *review* by T. H. Savory, 100
Millot, Prof. J. : New Facts about Coelacanths, 426
Mills, I. M. : Awarded a Research Fellowship in the United States by the National Academy of Sciences, Washington, 1173
Mills, Sir Percy : Appointed chairman of the National Research Development Corporation, 20
Milne, Dr. J. A. : Disorders of the Alimentary Tract and their Nutritional Effects, 1091
Milner, H. B. : Selected Values of Physical and Thermodynamic Properties of Hydrocarbons and related Compounds, *review*, 54
Milnes, A. G. : Awarded a United States Fellowship by the National Academy of Sciences, Washington, for research at the United States Naval Ordnance Laboratory, Silver Spring, Maryland, 164
Milnes, A. G., and Vernon, T. V. : Awarded jointly a Bowen Prize for 1953 by the Institute of Physics, 208
Mind : Sensory Gateway to the, *review* by Prof. John Cohen, 417
Mind and Modern Science : Nature, (Prof. Errol E. Harris), *review* by F. I. G. Rawlins, 480
Mineral Nutrients in Tropical Soils : The Immobilization of (W. V. Bartholomew, J. Meyer and H. Laudelout), 23
Mineralogical Society : Election of Officers for 1954–55, 910
Minerals (African) : Estimates of Age for some (Prof. J. T. Wilson, R. M. Farquhar, P. Gretener, R. D. Russell and H. A. Shillibeer), 1006
Minerals for the Chemical and Allied Industries (Sydney J. Johnstone), *review* by V. A. Eyles, 574
Minerals used in Industry, *review* by V. A. Eyles, 574
Mineur, Dr. Henri : *Obituary* by Dr. A. Hunter, 338
Mining at Sheffield, 250
Minnhagen, L. : Atomic Line Spectra, 730
Minnis, C. M. : The Ionosphere during the Solar Eclipse of February 25, 1952, 1137
Minto, Prof. Antonio : *Obituary* by W. L. Brown, 632
Mitchell, H. T. : Ageing of Quartz Crystal Vibrators, 41
Mitchell, H. T., and others : World-wide Frequency and Time Comparisons by means of Radio Transmissions, 922
Mitchell, J. S. : Physical and Chemical Aspects of Basic Mechanisms in Radiobiology, 369
Mitchell, Dr. J. W. : Defects in Crystalline Solids, 377
Mitchell, P. W. D. : Symbols and Terminology used in Absorption Spectroscopy, 591
Mites (Trombiculid) : A Method of Rearing Individual, in the Field (Dr. J. R. Audy and M. Nadchatram), 1021
Mitochondria (Plant) : Storage of (J. M. Tager), 932
Mitochondrial Adenosine Triphosphatase : Effect of Silver Ions on (J. B. Chappell and G. D. Greville), 930
Mitosis : Presence of Zinc in Nucleoli and its Possible Role in (Dr. T. Fujii), 1108
Mitra, M. K., and others : Pentoses associated with Jute α-Cellulose, 228
  Structure of Cotton α-Cellulose, 1058
Mitra, Prof. S. K., and Kundu, M. R. : Thunderstorms and Sporadic *E* Ionization of the Ionosphere, 798
Mittler, Sidney : Nutritional Availability of Cobaltic Oxide, Co_2O_3, 88
Mixtures : Quantitative Infra-Red Analysis of (L. R. C. McDonald), 703
M.K.S. System of Units (T. McGreevy), *review* by G. R. Noakes, 527
Model System for the Olfactory Membrane (Dr. J. T. Davies and F. H. Taylor), 693
Models of *cyclo*Hexane, Decalin and Steroid Systems : Fluorescent Glass (W. Brady), 590
Modern World : The Influence of Scientific Research in the (Symposium at the Research Laboratory in Geneva of the Battelle Memorial Institute), 910
  Science in the, 299
  Social Responsibility in the, 413
Modified Wedge Method for exciting Shear Modes in Isotropic Media (Dr. B. Ramachandra Rao and P. Venugopala Rao), 835
Mogensen, Allan H. : Management in the Research Laboratory, 1043
Mogollon Culture in New Mexico : Cave Sites of the (Paul S. Martin, John B. Rinaldo and Elaine Bluhm), 997
Mohanty, Dr. J. K. : Development of Tolerance to Ganglion Blockade by Methonium Compounds, 184
Mole (*Talpa europaea*) : Occurrence of *Haplosporangium parvum* in the Lungs of the (Dr. A. McDiarmid and P. K. C. Austwick), 843
Molecular Spectroscopy (Spectroscopic Panel of the Hydrocarbon Branch of the Institute of Petroleum Conference on), 636, 1165
Molecular Structure : The Principles of Atomic and (W. N. Lipscomb), (Comprehensive Inorganic Chemistry, edited by Prof. M. Cannon Sneed, Prof. J. Lewis Maynard and Prof. Robert C. Brasted, Vol. 1), *review* by Dr. R. Spence, 944
Molecular Vibrations : Odour and (H. E. Hallam), 134
Molecular Weight and Volatility (Dr. D. C. Bradley), 323
Molécules : Les applications de la mécanique ondulatoire à l'étude de la structure des (Réunions d'études et de mises au point tenues sous la présidence de Louis de Broglie), *review* by S. Weintroub, 989
Molecules (Biological) : X-Ray Studies of (Sir Lawrence Bragg), 55
Molecules and Crystals of Fluorocarbons : Structures of (C. W. Bunn and E. R. Howells), 549
Möllenstedt, Prof. G., and Keller, Dr. M. : Electron Optics, 825
Molten Salts : Reactions of, with Layer-Lattice Silicates (Joe L. White), 799
Molybdenum in the Growth and Metabolism of *Chlorella* (Dr. J. F. Loneragan and Prof. Daniel I. Arnon), 459
Molybdenum Deficiency : Varietal Susceptibility of Brassicas to (M. Neenan and O. G. Goodman), 972
Molybdenum Requirement of Tomato Plants grown in Sand Culture : Relation of Nitrogen Supply to the (Dr. E. J. Hewitt and Dr. C. C. McCready), 186
Mommaerts, Dr. W. F. H. M. : Chemistry of Muscle Contraction—Is Adenosine Triphosphate broken down during a Single Muscle Twitch ?, 1083
Monastic Archaeology in Kent : The Present State of (F. C. Elliston Erwood), 69

Mond Nickel Fellowships : Awards for 1954, 1174
Monkey Book : The (Ernest P. Walker), *review* by Dr. L. Harrison Matthews, 418
Monkeys as Pets, *review* by Dr. L. Harrison Matthews, 418
'Monobacterial' Culture : Size of Trichostrongyle Infective Larvae in (P. A. G. Wilson), 520
Monoisotopic Elements : Atomic Weights of the (Prof. Henry E. Duckworth), 595
Monolayers (Stearic Acid) : Reaction of, with Copper and Cuprous Oxide (Alan Dobry and Henry E. Mahncke), 507 ; (Dr. D. Tabor), 507
Monomolecular Layers of Nerve Lipoids : Local Anaesthetic Potency and (Dr. J. C. Skou), 318
Monroe, A. G. (Gaffee, D. I., and) : Measurement of Small Differential Pressures at Low Absolute Pressures, 756
Montagu, Prof. M. F. Ashley : The Piltdown Bones and 'Implements', 65
Montgomery, Gaylord C., and others : Science in Everyday Life, *review* by Dr. Maurice Ashby, 331
Montmorillonites (Indian) : X-Ray and Differential Thermal Studies of some (A. K. Bose and Purnima Sengupta), 40
Moon Puzzle (N. O. Bergquist), *review* by M. D., 668
Moore, W. C. : International Co-operation in the Field of Crop Protection, 766
Moore-Sitterly, Mrs. C. E. : Atomic Line Spectra, 731
Moorhouse, Dr. R. G. (Bellamy, E. H., and) : Nuclear and Meson Physics—International Conference in Glasgow, 530
Morelli, G. : Awarded a Ramsay Memorial Fellowship for 1954–55 for research in chemistry, 112
Moran, Donald F. (Steinbrugge, Karl V., and) : An Engineering Study of the Southern California Earthquake of July 21, 1952, and its Aftershocks (Seismological Society of America), 909
Moran, Dr. T., and others : The Lipids in Flour—Oxidative Changes induced by Storage and Improver Treatment, 449
  The Flavour of Porridge, 458
Moretti, G. P. : Biological, Physical and Chemical Characteristics of the Profundal Zone of Lakes, 1137
Morgan, D. M. (Wade, H. E., and) : Differentiation of Growing and Non-Growing Bacteria by a Staining Technique, 920, *erratum*, 1087
Morgan, Dr. L. B. : Chemistry and Physics of Synthetic Fibres, 116
Mori, Nobuo (Tsuzuki, Prof. Yojiro, and) : Sweetness and Configuration in Rhamnose, 458
Morphological Basis of Quality in Tea (Dr. T. Eden), 844
Morphological Changes induced in *Helminthosporium sativum* : Antibiotic Production by Actinomycetes in Soil demonstrated by (I. L. Stevenson), 598
Morphology (Plant) : Experimental, *review* by Dr. E. Ashby, 285
Morris, G. A., and Jackson, J. : Absorption Towers, *review* by Prof. H. E. Watson, 1072
Morris, Dr. K. R. S. : Animal Populations and Forestry, 815
Morris, R. L. : Appointed agricultural officer, Sierra Leone, 864
Morrison, G. L. : Awarded a scholarship in agricultural economics (farm management) by the Ministry of Agriculture of Northern Ireland, 821
Morrison, Herbert : Government and Parliament, a Survey from the Inside, 282
Morrison, J. : Appointed agricultural officer, Kenya, 864
Morrison, Dr. John L., and Miller, David M. : Alternation in the Adsorption of Aliphatic Acids on Porous Carbon, 1188
Morrison, T. M. : Uptake of Phosphorus-32 by Mycorrhizal Plants, 606
Mortelmans, Dr. J. (Deom, Dr. J., and) : A Case of *Shigella sonnei* Septicaemia in a Calf, 316
Mortimer, C. H. : Fertilizers in Fishponds, *review* by F. T. K. Pentelow, 1120
Mortimer, D. C. (Towers, G. H. N., and) : Identification of an Artefact on Chromatograms of the Keto-acid 2,4-Dinitrophenylhydrazones, 1189
Morton, Prof. A. A. : Synthetic Rubbers, 169
Morton, Dr. T. H. : Chemistry and Physics of Synthetic Fibres, 117
Mosquito Taxonomy : Paper Chromatography as a Tool for—The *Culex pipiens* Complex (Dr. Don W. Micks), 217
Mosquitoes (Anophelina) : Estimation of the Survival-Rate of, in Nature (G. Davidson), 792
Moss, L. : Social and Individual Significance of Ageing, 682
Mostafa, Prof. M. A. : Adventitious-Root Formation by Fungal Pathogen Metabolites as a Possible Mechanism of Disease Resistance, 86
Mota, Dr. I., and others : Intracellular Distribution of Histamine, 698
Moth (Emperor), *Saturnia pavonia* L. : Factors affecting the Larval Spot Colours of the (D. B. Long), 563
Mothes, Prof. K. : Elected president of the German Leopoldina Academy of Natural Sciences, Halle, 864
Motor : The Synchronous Induction (J. Griffin), *review* by H. M. Clarke, 944
Mott, Prof. N. F. : The Physics of the Solid State, 377
Motzel, Werner, and others : Infra-red and Ultra-violet Absorption Spectra of Proteins in the Solid State, 1144
Mountfield, A. R. : Awarded the Vickers-Armstrongs Scholarship in Naval Architecture by the Institution of Naval Architects, 864
Mountfort, G. R. : Appointed a member of the Advisory Committee on the Protection of Birds for England and Wales, 1086
Mourant, Dr. A. E. : Blood Groups, *review*, 898
Moureau, Prof. P., and Andre, Dr. A. : Blood Groups of Human Blood Platelets, 88
Mouse : Partial Sex Linkage in the (T. C. Carter, Mary F. Lyon and Rita J. S. Phillips), 309 ; (B. M. Slizynski), 310
Mouse Embryos : Colchicine-induced Heteroploidy in Early (R. G. Edwards), 276
  Independence of Delayed Fertilization and Spontaneous Triploidy in (A. H. Gates and Dr. R. A. Beatty), 356
Mouse Liver : Intracellular Sites of Metabolism of 3 : 4 Benzpyrene in (G. Calcutt and S. Payne), 841
Mouth : Isolation from the Lower Respiratory Tract of Chickens of Bacteria administered by (H. Williams Smith), 45
Movement of Higher Fatty Acids on Filter Paper : Electrophoretic (Dr. A. John G. Barnett and D. K. Smith), 659
Moving Tungsten Wire : Angle of Contact of Mercury against a (A. H. Cook and N. W. B. Stone), 366
Mowat, W. P. : Appointed plant pathologist, Tanganyika, 821
Mozell, M. M., and Pfaffman, C. : Odour Research, 303
Mucic Acid from Fruits : Isolation of (E. F. L. J. Anet and T. M. Reynolds), 930
Mucoproteins : The Precursor of 2-Carboxy-Pyrrole in (Dr. A. Gottschalk), 652
Mukherji, Prof. S. M., and others : A Novel Synthesis of 4-Methyl-1 : 2-Benzanthracene, 834
Muller, Dr. K. O., and others : Effect of Streptomycin on the Host-Pathogen Relationship of a Fungal Phytopathogen, 878
Mullin, J. B., and Riley, Dr. J. P. : Cadmium in Sea-water, 42
Multichannel Flame-Spectrometer : Simultaneous Determination of Sodium, Potassium, Calcium, Magnesium and Strontium by a New (Dr. Bert L. Vallee), 1050
Munford, W. A. (edited by) : The Year's Work in Librarianship, Vol. 17, 1950, *review*, 900
Munro, Dr. H. N. : Nutrition and the Liver, 167
  Text-Book of Biochemistry, *review*, 479
Munro, I. A. : Awarded a Postgraduate Scholarship in Husbandry by the Department of Agriculture for Scotland, 681
Munro, Miss Madeline : *Obituary* of Miss Rosamund F. Shove, 995
Münster, Prof. A., and others : Titanium Nitride and Titanium Carbide as Semi-conductors, 1154
Murdoch Bicentenary (Prof. R. J. Sarjant), 822
Murdoch Memorial Lecture of the Institution of Gas Engineers (Dr. Alexander Fleck), 492
Murex tribulus from the Great Bitter Lake, Egypt : Variation of the Shells of (Dr. Monica Taylor), 1111
Murgatroyd, R. J. : Physics of Clouds and Precipitation, 959
Murnaghan, A. R., and others : Paramagnetic Resonance in Carbonaceous Solids, 797
Murphy, —. : The Interactions between Acid Soils and Forest Trees, 857
Murphy, E. A. : Natural Rubber Latex, 168
Murray, Margaret R., and Kopech, Gertrude (prepared by) : A Bibliography of the Research in Tissue Culture, 1884 to 1950, *review*, 576
Murray, Miss M. W. : Awarded a Postgraduate Scholarship in Husbandry by the Department of Agriculture for Scotland, 681
Murray Travelling Studentship in Oceanography and Limnology of the Royal Society awarded to P. Hughes, 18
Murrell, K. H. F. : The Worker in Industry, 118
Murthy, Dr. M. V. N. : Kornerupine from Ranno, Uttar Pradesh, India, 1065
Muscle (Heart) : Chemical Physiology of Contraction in Body and (Prof. A. Szent-Gyorgyi), *review* by J. R. Bendall, 477
Muscle Contraction : Chemistry of—Contraction of Muscle without Fission of Adenosine Triphosphate or Creatine Phosphate (Prof. A. Fleckenstein, Dr. J. Janke, Dr. R. E. Davies and Prof. H. A. Krebs), 1081 ; Is Adenosine Triphosphate broken down during a Single Muscle Twitch ? (Dr. W. F. H. M. Mommaerts), 1083
Muscles (Flight) : Succinoxidase Activity of the, of the Wasp, *Sceliphron caementarium* (Prof. Sol Kramer), 43
Muscle of Codling (*Gadus callarias*) : 'Browning' Reactions in Freeze-dried Extractives from the Skeletal (Dr. N. R. Jones), 605
Museum Techniques, 385
Museum of Applied Arts and Sciences, Sydney : Annual Report for 1953, 863
Museum of Applied Science of Victoria : Report for 1952–53, 539
Museum of Comparative Zoology, Harvard College : Annual Report for 1952–53, 635
Museum of South Australia : Annual Report for 1952–53, 66
Museums Association : Sixtieth Annual Conference, 333
  Presidential Address (Sir Leigh Ashton), 333
  Annual Report, 539
Mushroom Research Station, Yaxley : Closing of the, and Transfer of Work, 252
Mushrooms and Toadstools, a Study of the Activities of Fungi (Dr. John Ramsbottom), *review* by Prof. Ronald Good, 197
Muskhelishvili, N. I. : Singular Integral Equations, second edition, *review* by Prof. R. Hill, 713
  Some Basic Problems of the Mathematical Theory of Elasticity (translated from the Russian by J. R. M. Radok), third edition, *review* by Prof. R. Hill, 713
Mustard Gas : Some Cytological Observations on the Delayed Effect of (Dr. G. E. Nasrat), 968
Mutant Stock of *Drosophila* : Fluorescent Substances in Chromatograms of a (Dr. Elisabeth Goldschmidt), 883
Mutton Fat (Hydrogenated) : Isolation of *n*-Heptadecanoic Acid from (R. P. Hansen, F. B. Shorland and Dr. N. J. Cooke), 39
Mycobacterial Metabolism : Metaphosphate in (Frank Winder and Joan M. Denneny), 353
Mycorrhiza : Beech (British Association for the Advancement of Science, Section K (Botany), Discussion on), 684
Mycorrhizal Plants : Uptake of Phosphorus-32 by (T. M. Morrison), 606
Mycorrhizal Uptake and Translocation of Phosphorus (Dr. J. L. Harley and Dr. J. K. Brierley), 776
Myoglobin : The Species Specificity of (Dr. J. C. Kendrew and Dr. R. G. Parrish, and Prof. J. R. Marrack and Dr. E. S. Orlans), 946
Myxomatosis in Britain (Dr. C. H. Andrewes), 529
Myxomatosis Advisory Committee : Appointment of Lord St. Aldwyn as chairman, 1132
  Appointment of Dr. I. Thomas as a member, 1132

NACHMANSOHN, Dr. D. : Chemistry in relation to the Development of the Nervous System, 457
Nadchatram, M. (Audy, Dr. J. R., and) : A Method of Rearing Individual Trombiculid Mites in the Field, 1021
Naftalin, Dr. J. M. : Nutrition and the Liver, 167
Naganna, Dr. B., and Sripathi, C. E. : Pyrophosphatases in Plants during Growth, 593
Naismith, Dr. W. E. F. : Chemistry and Physics of Synthetic Fibres, 116
Nakano, M., and others : Destruction of Tumour Cells by Rift Valley Fever Virus, 698

Naphthalene (A), Compounds containing One Naphthalene Nucleus, Naphthoic Acids and their Halogen, Nitrogen and Hydroxyl Derivatives (Elsevier's Encyclopaedia of Organic Chemistry, edited by F. Radt, Series 3, Carboisocyclic Condensed Compounds, Vol. 12B), *review* by Dr. J. W. Cook, 1073
Naphthoic Acids and their Derivatives, *review* by Dr. J. W. Cook, 1073
Naphthoquinones : Fluorescence of (Jack Peter Green), 369
Narayan Rao, N. N. (Havemann, Prof. H. A., and) : Heat Transfer in Pulsating Flow, 41
Narayanaswami, Dr. S. (LaRue, Prof. Carl D., and) : A New Type of Branching in Liverworts, 313
Narcotic Activity of Fluorocarbons : Toxicity and (A. A. Banks, A. Campbell and A. J. Rudge), 885
Narcotics and Brain Respiration (Dr. J. J. Ghosh and Prof. J. H. Quastel), 28
Nasrat, Dr. G. E. : Some Cytological Observations on the Delayed Effect of Mustard Gas, 968
National Academy of Sciences, Washington : United States Research Fellowships for British Scientists, 164, 1173
  Publication 306, Symposium on Microseisms (edited by James T. Wilson and Frank Press), 302
  Publication 305, Physical and Chemical Aspects of Basic Mechanisms in Radiobiology—Proceedings of an Informal Conference held at Highland Park, Illinois, 1953 (edited by John L. Magee, Martin D. Kamen and Robert L. Platzman), 389
National Bureau of Standards, United States : Handbook 55, Protection against Betatron and Synchrotron Radiations up to 100 million Electron Volts, 340
  Circular 523, Energy Transfer in Hot Gases, 383
National Central Library : Thirty-eighth Annual Report, 862
National Central Library and National Committee on Regional Library Co-operation : Recommendations on Library Co-operation, 916
National Coal Board : Gift of £3,475 to the Department of Mining, University of Leeds, for special research projects, 863
  Research Work on Smokeless Fuels (Sir Charles Ellis), 1130
  Grant of £1,600 to the University of Birmingham, for research in the Department of Mining, 1132
National Coal Board (Northeastern Division) : Gift of £3,900 to the Department of Mining, University of Leeds, being renewal of an annual grant, 864
National Collection of Yeast Cultures : Official Catalogue of the (Brewing Industry Research Foundation), 492
National Committee for the Defence of Children : Making our Way (Mrs. Peggy Jay), 862
National Committee on Regional Library Co-operation (National Central Library and) : Recommendations on Library Co-operation, 916
National Defence : Financial Control of Research for, 95
National Foundation for Scientific Research, Brussels : Annual Report for 1952–53, 430
National Institute of Agricultural Botany : Thirty-third Annual General Meeting of Fellows, 67
  Annual Report for 1953, 429
National Institute of Agricultural Botany—its Past, Present and Future (Sir John Russell), 446
National Institute for Research in Dairying : Annual Report for 1953, 208
National Museum of Wales : Forty-sixth Annual Report (1952–53), 343
National Museums, Ceylon : Administration Report for 1953, 727
National Physical Laboratory : Amalgamation of the Electronics and the Control Mechanisms Sections as the Control Mechanisms and Electronics Division, 110
  Appointment of R. H. Tizard as officer-in-charge of the Control Mechanisms and Electronics Division, 110
  Appointment of E. I. Brimelow and A. J. Garratt as liaison officers, 110
  Notes on Applied Science, No. 6, Volumetric Glassware—Scientific Aspects of Design and Accuracy, 635
  Symposium on Precision Electrical Measurements, 910
  Notes on Applied Science, No. 7, Balances, Weights and Precise Laboratory Weighing, 1004
National Research Council of Canada : Awards for 1954–55, 344
  Postgraduate Fellowships for 1954–55, 540
  Canadian Geophysical Bulletins, Vol. 6, 954
National Research Development Corporation : Appointment of Sir Percy Mills as chairman, 20
  Appointment of Prof. P. M. S. Blackett, Sir John Duncanson and Sir Edward de Stein as members for a further period, 20
  Appointment of Sir Henry Hinchliffe and Sir Alan Saunders as members, 20
National Science Foundation : Third Annual Report, 70
National Scientific Documentation Centre, New Delhi : Insdoc List of Current Scientific Literature, 431
National Technical Information Services Officers : First Meeting of, 677
National Trust : Fifty-ninth Annual Report, 1134
Native and Mercerized Celluloses : Structures of (Dr. J. O. Warwicker), 135 ; (H. J. Wellard), 135 ; (H. J. Woods), 136
Natural Coloration of Diamonds : Artificial and (R. A. Dugdale), 120
Natural Colouring Matters : Complex (British Association for the Advancement of Science Symposium on), 990, *erratum*, 1132
Natural Constituents of the Body : Chemotherapeutic Experiments with (Dr. Hans Meyer-Doring), 555
Natural Environment : Examination of Soil Micro-organisms in their (Mrs. F. E. S. Alexander and R. M. Jackson), 750
Natural Fats : Occurrence of Fatty Acids with Uneven-numbered Carbon Atoms in (Dr. F. B. Shorland), 603
Natural Pigments : Chemistry of some, 993, *erratum*, 1132
Natural Selection : The Case for (Prof. Julian Huxley), 279 ; (Sir James Gray), 279
Natural and Synthetic Melanins : A Comparison of some (W. D. Stein), 601
Nature : Estimation of the Survival-Rate of Anopheline Mosquitoes in (G. Davidson), 792
Nature in the Near and Middle East : Conservation of (Lebanese Society of the Friends of the Trees and Unesco Middle East Science Co-operation Office Conference on), 299
Nature, Mind and Modern Science (Prof. Errol E. Harris), *review* by F. I. G. Rawlins, 480
Nature of Science and other Lectures (Edwin Hubble), *review* by Prof. F. J. M. Stratton, 665
Nature of Things : Sex and the (Dr. N. J. Berrill), *review* by Dr. Clifford Allen, 763
Nature Conservancy : Declaration of the Cairngorms Nature Reserve, 162
  Awards of Research Studentships, 727
  Scientific Research, 908 ; Finance and Land Transference, 908
  Report for the Year ended September 30, 1954, 1159, 1173
Nature Protection in the Near and Middle East (Lieut.-Colonel C. L. Boyle), 288
Nature Reserve : Cairngorms, 162
Nature Reserves in Britain : New, 19
Nature Reserves in England and Wales : New, 1088
Nature Reserves, Society for the Promotion of : Handbook for 1953, 162
  Handbook for 1954, 1087
Naunton, Dr. W. J. S. : Synthetic Rubbers, 169
Naval Architects, Institution of : Scholarship Awards, 864
  I.N.A.–Elgar–Martell Scholarship in Naval Architecture, 1132
  Denny Scholarships in Naval Architecture and Marine Engineering, 1132
Naval Architecture : Denny Scholarship in (Institution of Naval Architects), 1132
  Institution of Naval Architects Scholarship in, awarded to J. C. Salisbury, 864
  Vickers-Armstrongs Scholarship in, awarded to A. R. Mountfield by the Institution of Naval Architects, 864
  I.N.A.–Elgar–Martell Scholarship in (Institution of Naval Architects), 1132
Naval Research, Office of, and the Geophysical Research Division of the United States Air Force : Symposium on Microseisms, 302
Naylor, Dr. Ralph F. : *Obituary of Prof. C. R. S. Teonswood*, 536
Neal, P. B. N. : Appointed a lecturer in mechanical engineering at the University of Sheffield, 820
Near East : Wheat Breeding in the (Dr. T. Abdel-Hak), 253
Near and Middle East : Conservation of Nature in the (Lebanese Society of the Friends of the Trees and Unesco Middle East Science Co-operation Office Conference on), 289
  Nature Protection in the (Lieut.-Colonel C. L. Boyle), 288
Neatby, Dr. K. W. : The Application of Biological Research to Canadian Agriculture and Forestry, 766
Nebula (Andromeda) : Radio Emission from the (J. E. Baldwin), 320
Nebulae : The Law of Red Shifts and the Distances of (the late Dr. Edwin Hubble), 1046
Nebulae (Ionized Hydrogen) : Radio Observations of, and other Discrete Sources at a Wave-length of 9·4 cm. (F. T. Haddock, C. H. Mayer and R. M. Sloanaker), 176
Nebulae and Clusters of Stars : New General Catalogue of (J. L. E. Dreyer), 634
Nederlands Meteorologisch Instituut : Koninklijk, (1854–1954), 203
Needham, Dr. Dorothy M. (Needham, Dr. Joseph, and) : Physiology in Hungary, 545
Needham, Dr. Joseph, and Needham, Dr. Dorothy M. : Physiology in Hungary, 545
Neenan, M., and Goodman, O. G. : Varietal Susceptibility of Brassicas to Molybdenum Deficiency, 972
Neeteson, P. A. : Television Receiver Design, Monograph 2, Flywheel Synchronization of Saw-Tooth Generators, *review* by Dr. R. L. Smith-Rose, 99
Negus, Victor Ewings : Awarded the Lister Medal for 1954, 344
Nehru, Jawaharlal : New Laboratory Building of the Ahmedabad Textile Industry's Research Association opened by, 578
Nelles, Dr. Maurice : Basic Research in an Applied Research Laboratory, 1044
Nelson, Eva R., and others : Barbiturate Antagonism, 402
Nematode *Haemonchus contortus* (Rudolphi 1803) Cobb 1898 : Cytological Polymorphism in the (K. C. Bremner), 704
Nematode (Plant Parasitic) : Environmental Determination of the Sex Ratio of a (Dr. C. Ellenby), 1016
Nematode Larvae : The Cuticle of (Alan F. Bird), 362
  The Second Ecdysis of Infective (R. I. Sommerville), 751
Nematodes : Plant (Association of Applied Biologists Symposium on), 769
Neo-Herculin from *Zanthoxylum clava-herculis* L. : Isolation and Structure of (Dr. L. Crombie), 833
Neolithic Cultures of the British Isles (Prof. Stuart Piggott), *review* by Prof. V. G. Childe, 575
Neonatal Rat : Effect of Cortisone on the (Dr. E. J. Field), 182
Nerve Cells : Ribonucleotide Analysis of Individual (Jan-Erik Edström and Holger Hydén), 128
Nerve Endings (Free), as Transducers of Thermal Stimuli (H. J. V. Tyrrell, D. A. Taylor and C. M. Williams), 918
Nerve Lipoids : Local Anaesthetic Potency and Penetration of Monomolecular Layers of (Dr. J. C. Skou), 318
Nervous System : Chemistry in relation to the Development of the (Mental Health Research Fund first International Neurochemical Symposium), 455
Netherlands, The : Scientific Books and Periodicals from (Exhibition at the Science Library, London), 998
Netherlands Meteorological Institute : The Royal, 1854–1954 (Prof. W. Bleeker), 203
Network Analyser of the Electrical Research Association, 214
Neuberger, Dr. A. : Appointed to a University of London chair of chemical pathology at St. Mary's Hospital Medical School, 537 ; work of, 537
  Complex Natural Colouring Matters, 991
Neumann, R. : Electrical Machines and Transformers, *review*, 988
Neumuller, Carola : Detoxification of Diphtheria Toxin with Formaldehyde mixed with an Amino-acid, 405
Neurath, Hans, and Bailey, Kenneth (edited by) : The Proteins, Vol. 2, Part A, *review* by N. W. Pirie, 762
Neurochemical Symposium : First International (Mental Health Research Fund), 455
Neurohypophyseal Control of Follicular Maturation in the Domestic Fowl (R. M. Fraps and M. H. Conner), 1148
Neurons (Chick) : Autonomous Differentiation of some, isolated in Chorion-Allantoic Grafts (Prof. Alberto Stefanelli), 974

Neutral Solvents : Isolation of Lignin from Finely Divided Wood with (Dr. Anders Bjorkman), 1057
Neutralization of Silkworm Jaundice Virus by Human Serum (K. Aizawa), 748
Neutron Multiplication in a System of Uranium Rods and Ordinary Water : Measurements on the (Rolf Persson), 265, *erratum*, 636
14-MeV. Neutrons : Inelastic Scattering of, by Lithium-7 (D. L. Allen), 267
Neville, Prof. E. H. : Weather Forecasting, 673
Neville, Leslie E. : Communication Problems in a Research Operation, 1044
New Delhi : Scientific Literature in, 431
New Mexico : Cave Sites of the Mogollon Culture in (Paul S. Martin, John B. Rinaldo and Elaine Bluhm), 997
New Property of Coal-like Materials : Paramagnetic Resonance, a (J. Uebersfeld, A. Étienne and J. Combrisson), 614
New South Wales · Aboriginal Rock-paintings in (W. H. Kinsela), 343
New York Academy of Sciences : Symposium on Parental Age and Characteristics of the Offspring, 304
New York Academy of Sciences and the American Society of Heating and Ventilating Engineers : Conference on Odour, 303
New Zealand : Breeding Season of the Wild Rabbit in (J. S. Watson), 608
  Forestry in (Prof E. P. Stebbing), 173
  Forestry in (New Zealand Forest Service, Information Series of Pamphlets No. 1), 491
  Insects and the Diseases of Conifers in (G. B Rawlings), 1087
  Science in (H.R.H. the Duke of Edinburgh), 678
  Seismology in, during 1951–53, 863
New Zealand Botany : Australian and (Prof. J. McLuckie and Dr. H. S. McKee), *review* by E. A., 331
New Zealand Department of Scientific and Industrial Research : Departmental Handbook, 636
New Zealand Forest Service · Annual Report for 1952–53, 173
  Information Series of Pamphlets, No. 1, Forestry in New Zealand, 491
Newbould, P. H. S., and Garrard, E. H. : An Actinophage for Potato Scab, 997
Newell, G. E. : Animal Zones of the North Kent Coast, 69
Newly Fallen Snow and Air Temperature (Prof. Mario Bossolasco), 362
Newnham, J. L. M., and others · Natural Rubber Latex, 169
Newt Embryo · Nuclear Uptake of Glycine-2-^{14}C in the (J. L. Sirlin and Prof. C. H. Waddington), 309
Newth, Dr. D. R. · The Bulgarian Academy of Sciences, 590
Newton, A. R. : Appointed geologist, Northern Rhodesia, 821
Newton, Prof. Lily (Knight, Dr. Margery, and) : *Obituary* of Prof. F. E. Fritsch, 294
Nicander, Dr. Lennart : Glycogen Secretion in the Epididymis, 700
Nicholson, D. L : Appointed ecologist, North Borneo, 492
Nicholson, E. M. : The Numbers of Man and Animals, 816
  Appointed a member of the Advisory Committee on the Protection of Birds for England and Wales, 1086
Nickel and Porous Alumina Sample Holders for Differential Thermal Analysis : Comparative Performance of (T. L. Webb), 686 ; (Dr. Robert C. Mackenzie), 688
Nickerson, B. . A Possible Endocrine Mechanism controlling Locust Pigmentation, 357
Nicol, Prof. T., and Snell, R. S. : Cortisone in relation to Infection and Tumour Growth, 534
Nigeria . Forestry in—Annual Report for 1951–52, 384
Nigerian Vegetation (R. W. J. Keay), 343
'Nimonic 95' : Properties of, 726
Nineteenth Century Scientific Instruments from the Thirteenth to the, 775
Nishida, Shoki : Potent Diphtheria Toxin within the Cells of *C. diphtheriae*, 970
Nissen, T. Vincents : Effects of Antibiotics on Carbon Dioxide Production in Soil, 226
Nitrogen : Chemical Form of Phosphorus-32 produced in Aluminium by Bombardment with (Dr. G. A. Checkett and K. F. Checkett), 232
Nitrogen Dioxide : Effect of, on the Thermal Decomposition of Ethyl Nitrite (Dr. F H. Pollard, A. E. Pedler and C J. Hardy), 979
Nitrogen Fixation *in vitro* : Attempts at (T. G. G. Wilson and E. R. Roberts), 795
Nitrogen Fixation by Soil Yeasts (Dr. George Metcalfe and Sonja Chayen), 841 ; (Dr. E. R. Roberts and Dr. T. G. G. Wilson), 842
Nitrogen Supply : Relation of, to the Molybdenum Requirement of Tomato Plants grown in Sand Culture (Dr. E. J. Hewitt and Dr. C. C. McCready), 186
Nixon, H. L. : The Physics of Viruses, *review*, 989
Noakes, G. R. : MKS Units, *review*, 527
  Properties of Matter, *review*, 1120
Nobel Prize for Chemistry for 1954 awarded to Prof. Linus Pauling, 907
Nobel Prize for Physics for 1954 awarded jointly to Prof. Max Born and Prof. W. Bothe, 907
Nobel Prize for Physiology and Medicine for 1954 awarded jointly to Prof. John F. Enders, Prof. Frederick C. Robbins and Prof. Thomas H. Weller, 818
Noble, S. W. : Promoted to Senior Principal Scientific Officer in the Scientific Civil Service, 999 ; work of, 999
Nockolds, Dr. S. R. : Distribution of Minor Elements in Rocks, 811
Nodule Homogenates (Soy-bean) : Biosynthesis of Haemin in (Jones E. Richmond, Dr Kurt Salomon and S. Caplin), 34
Noise (Aircraft) · Problems of, 119
Nomenclature : Zoological (Francis Hemming), 46, 1022
Non-Calcareous Material in the Shell of *Anodonta cygnea* : Properties of the (G. E. Beedham), 750
Non-Ferrous Metals Research Association, British : Election of Dr. Maurice Cook as chairman, 1174
Non-Growing Bacteria (Growing and) : Differentiation of, by a Staining Technique (H. E. Wade and D. M. Morgan), 920, *erratum*, 1087
Non-ionic Detergents : Use of Adsorption Columns in the Analysis of Emulsions stabilized with (T. Green, R. P. Harker and F. O. Howitt), 659
Non-isothermal Plasmas in the Rare Gases (R. D. Craig and Dr. J. D. Craggs), 367
Non-Polar Media : Catalysis of Olefin Autoxidation by Heavy-Metal Ions in (G. L. Banks, A. J Chalk, Miss J. E. Dawson and J. F. Smith), 274
Non-vernalized Chrysanthemums · Acceleration of Flowering in, by the Removal of Apical Sections of the Stem (Dr. D. Vince and D. T. Mason), 842 ; (Dr. W. W. Schwabe), 1022
Noradrenaline Blood Platelets as Carriers of Adrenaline and (Dr. H. Weil-Malherbe and A. D. Bone), 557
Nordin, V. J. : Decay of the Sugar Maple (*Acer saccharum*) in Ontario, 343
Normal and Sickle-Cell Haemoglobins · Ability of, to form Complexes (C. G. Anderson and S. B. Griffiths), 928
Norman, Dr. Irwin, and Porter, Dr. George : Trapped Atoms and Radicals in a Glass 'Cage', 508
Norman, M. : Weed Control, 1178
Norrish, Prof. R. G. W., and others : Photolysis of Chlorine Dioxide and Absolute Rates of Chlorine Monoxide Reactions, 785
North, A. C. T., and others : Structural Units in Collagen Fibrils, 1142
North, A. M. : Awarded a Research Studentship in Chemistry by British Celanese, Ltd., 681
North, Dr. F. J. : Training Problems in the Museum Profession, 334
North, George W., and others · Bibliography of Canadian Biological Publications for 1949, 634
North Atlantic : Wave Conditions in the, 1953–54 (J Darbyshire), 827
Northcott, Prof. D. G. Ideal Theory, *review* by Dr. L. S. Goddard, 7
Norvaline, a Growth Factor for Excised Tomato Roots (William G. Boll), 517
Novos, S., and others : Growth-regulating Activity of certain 2 : 6-Substituted Phenoxyacetic Acids, 742
Nuchal Crests in Australopithecines (J. T. Robinson), 1197 ; (Prof. S. Zuckerman), 1198
Nuclear Chemistry Theoretical and Applied (P R. O'Connor), (Comprehensive Inorganic Chemistry, edited by Prof. M. Cannon Sneed, Prof. J. Lewis Maynard and Prof. Robert C. Brasted, Vol. 1), *review* by Dr. R. Spence, 944
Nuclear Energy . Industrial Power from (Sir Christopher Hinton), 1085
Nuclear Energy, Journal of, 724
Nuclear Energy Research, Dutch-Norwegian Joint Establishment for Report for the Year 1952–53, 258
Nuclear Physics : Progress in (edited by O. R. Frisch), Vol. 2, *review* by Sir John Cockcroft, 150
  Recent Developments in (Sir John Cockcroft), 438
Nuclear Power (Research in British Power Industries), 996
Nuclear Reactor in Stockholm, 161
Nuclear Research, European Organization for : Election of Sir Ben Lockspeiser as president of Council, 774
  Appointment of Prof. E. Amaldi as deputy director-general, 774
  Appointment of Prof. F. Bloch as director, 774
  Appointment of Prof. C. J. Bakker as a member of the Directorate and director of the Synchro-cyclotron Division, 775
Nuclear Science · Annual Review of (edited by James G. Beckerley), Vol 3 (1953), *review* by Dr. E. Bretscher, 1162
  Notes on (Atomic Sciences Committee of the Association of Scientific Workers), 776
Nuclear Science in Physics, Chemistry and Biology, *review* by Dr. E Bretscher, 1162
Nuclear Uptake of Glycine-2-^{14}C in the Newt Embryo (J. L. Sirlin and Prof. C. H. Waddington), 309
Nuclear and Meson Physics (International Union of Pure and Applied Physics and Unesco Conference on), 530
Nuclei (Cell) : Deoxyribonucleoproteins of—Sensitivity to X-Rays (Maurice H. Bernstein), 463
Nuclei (Crystal) · Cataphoresis of (Koichi Hirano), 268 ; (Prof. A. R. Ubbelohde), 269
Nuclei (Liver) : Electrophoretic Migration of Contents of Intact (J. St. L. Philpot and J. E. Stanier), 651
Nuclei of the Thyroid Gland of the White Rat : Cell Activity and Deoxyribonucleic Acid Content of the (H. Roels), 514
Nucleic Acids, *review* by Dr. Roy Markham, 476
  The Biochemistry of the (Prof. J. N. Davidson), second edition, *review* by Dr. Roy Markham, 476
Nucleoli Presence of Zinc in, and its Possible Role in Mitosis (Dr. T. Fujii), 1108
Nuffield Foundation · Gift of £3,900 to the Department of Botany, University of Leeds, for research on the molecular structure of the cell walls of plants, 863
  Support for Research in Rheumatism, 909
  Grant for Colonial University Colleges, 997
Nuffield Foundation (Royal Society and) : Commonwealth Bursaries Scheme (Awards), 18, 1086
  Commonwealth Bursaries Scheme—Award made to Dr. S. Y. Thompson to visit the Dairy Research Institute, Palmerston North, 164
Numbers of Man and Animals (Institute of Biology Symposium on), 298, 815
Numerical Analysis : Principles of (Alston S. Householder), *review* by Dr. L. S. Goddard, 624
Nursten, Dr H. E. : Appointed a lecturer in the Department of Leather Industries of the University of Leeds, 1040
Nutrient Sprays Absorption by Leaves from (G. N. Thorne), 111
Nutrients (Mineral) : The Immobilization of, in Tropical Soils (W. V. Bartholomew, J. Meyer and H. Laudelout), 23
Nutrition : Drummond Fellowship for Research in, 955
Nutrition (Plant) Radioactive Tracers in (P. P. Martin and R. Scott Russell), 384
Nutrition Society (Scottish Group) : Symposium on Nutrition and the Liver, 167
  Symposium on Disorders of the Alimentary Tract and their Nutritional Effects, 492, 1090
Nutrition and the Liver (Scottish Group of the Nutrition Society Symposium on), 167
Nutritional Availability of Cobaltic Oxide, Co_3O_4 (Sidney Mittler), 88
Nutritional Dermatitis in Pigs : A Peculiar (G. Thomas and A. Eden), 553
Nutritional Effects : Disorders of the Alimentary Tract and their (Scottish Group of the Nutrition Society Symposium on), 492, 1090
Nutritive Value of Lucerne Protein Concentrates, fed with and without Cholesterol (S. J. Cowlishaw, D. E. Eyles, W. F. Raymond and J. M. A. Tilley), 227
Nuttall, Dr. H. : Resignation as lecturer in mechanical engineering at the University of Birmingham, 820

Nutting, Dr. J.: Developments in Metallurgical, Chemical and Industrial Applications of the Electron Microscope, 825
Nyholm, Prof. R. S.: Appointed to a University of London chair of chemistry at University College, 64
Nylander, Prof. Gunnar: Placental Transfer of a High Molecular Ferric Carbohydrate, 310

OAKLEY, Dr. K. P.: The Piltdown Bones and 'Implements', 62
Evidence of Fire in South African Cave Deposits, 261
Obourn, Ellsworth S., and others: Science in Everyday Life, *review* by Dr. Maurice Ashby, 331
Observation of Hapten–Antibody Equilibria: Direct (Paul Doty and Samuel I. Epstein), 89
Observations on the Chemistry of N-Carboxy-α-Amino-Acid Anhydrides: New (D. G. H. Ballard, Dr. C. H. Bamford and Dr. F. J. Weymouth), 173
Observatory: Gulmarg Research (Prof. P. S. Gill), 300
O'Carroll-Scott, Major-General A. G.: Appointed a member of the Advisory Committee on the Protection of Birds for England and Wales, 1086
Occiput: The Australopithecine (J. T. Robinson), 262, (Prof. S. Zuckerman), 263
Occupational Hygiene Society, British: Conference on Radiation Hazards in Industry, 209, 777
Occupational Medicine in Finland, 491
Oceanographic Conference: Commonwealth, 725, 1175
Oceanography, Laboratory of, Woods Hole: Dedication of the (Dr. G. E. R. Deacon), 107
O'Connor, P. R.: Theoretical and Applied Nuclear Chemistry (Comprehensive Inorganic Chemistry, edited by Prof. M. Cannon Sneed, Prof. J. Lewis Maynard and Prof. Robert C. Brasted, Vol. 1), *review* by Dr. R. Spence, 944
O'Connor, Miss W. T. M.: The Species Concept in relation to the British Flora, 247
d,l-α-Octadecylglycerolether in Mice given Total Body X-Irradiation: Protective Effect of (T. Edlund), 1102
O'Donnell, Dr. T. A.: To receive an award under the Commonwealth Bursaries Scheme of the Royal Society and Nuffield Foundation, 1086
Odour Research (New York Academy of Sciences and the American Society of Heating and Ventilating Engineers Conference on), 303
Odour and Chemical Constitution (J. Timmermans), 235
Odour and Molecular Vibrations (H. E. Hallam), 134
Oersted Medal for 1953 of the American Association of Physics Teachers presented to Prof. C. N. Wall, 914
Oertling, Ltd., L.: Ten-Tola Primary Standard Weight for Karachi Mint, Pakistan, 296, 1094
Riderless Microchemical Balances, 731
Œstrogen and of Vitamin A: Effect of, on Vaginal Cornification in Tissue Culture (Raymond H. Kahn), 317
Œstrus (Light-induced): Effect of Pituitary Stalk Section on, in the Ferret (B. T. Donovan and Prof. G. W. Harris), 503
Œstrus in Ferrets: Effect of Cervical Sympathectomy on the Onset of (M. E. Abrams, W. A. Marshall and A. P. D. Thomson), 311
Offspring: Age of Parent and Character of (Prof. K. Mather), 304
Parental Age and Characteristics of the (New York Academy of Sciences Symposium on), 304
Ohle, W.: Biological, Physical and Chemical Characteristics of the Profundal Zone of Lakes, 1136
Ohm, G. S. (1787–1854), 17
Oil Industry, 299
Oil Orange *TX*: Induction of Tumours with 1-(2-Tolylazo)-2-naphthol (Dr. G. M. Bonser, Dr. D. B. Clayson and Dr. J. W. Jull), 879
Oil Palm Research, West African Institute for: First Annual Report, 634
Oil and Colour Chemists' Association: Symposium on Rheology and Settlement of Pigmented Systems, 344
Oils (Dielectric): Structure of Breath Deposits on (A. Brin), 468
Oldham, Frank (completed by): Thomas Young, Natural Philosopher 1773–1829 (the late Dr. Alexander Wood), *review* by Dr. Derek J. Price, 239
Oldman, C. B.: Presidential Address to the Library Association, 911
Olefin Autoxidation: Catalysis of, by Heavy-Metal Ions in Non-Polar Media (G. L. Banks, A. J. Chalk, Miss J. E. Dawson and J. F. Smith), 274
Olefinic Nature of Anacardic Acid from Indian Cashew-nut Shell Liquid (V. J. Paul and Prof. Lourdu M. Yeddanapalli), 604
Oleic and Linoleic Acids in the presence of Straight-chain Saturated Fatty Acids: A Chromatographic Method for the Estimation of (W. Mary L. Crombie, R. Comber and S. G. Boatman), 181
Olfactory Membrane: A Model System for the (Dr. J. T. Davies and F. H. Taylor), 693
Oligosaccharides in the Apricot Fruit: Ketose (A. S. F. Ash and T. M. Reynolds), 602
Oliphant, Prof. M. L. E.: Appointed Rutherford Memorial Lecturer for 1955 by the Royal Society, 727
Oliphant, Prof. M. L. E., and others: Rutherford by Those who Knew Him, 161
Oliver Memorial Fund: Award for original work or services in connexion with research, organization or the donor aspect of blood transfusion, 113
Olson, Dr. J. A.: The *d*-*iso*Citric Lyase System—the Formation of Glyoxylic and Succinic Acids from *d*-*iso*Citric Acid, 695
O'Malley, Dr. Charles Donald: Michael Servetus, a Translation of his Geographical, Medical and Astrological Writings, with Introductions and Notes, *review* by Dr. Douglas Guthrie, 941
Omasum of Sheep: A Method of collecting Fluid leaving the (Prof. J. H. Bouckaert and W. Oyaert), 1195
Onchi, Masaru (Sasaki, Prof. Nobuji, and): Effect of Vapours of Halogen Compounds on the Emission of Positive Ions from Platinum, 84
Ondulatoire (Mécanique): Les applications de la, à l'étude de la structure des molécules (Réunions d'études et de mises au point tenues sous la présidence de Louis de Broglie), *review* by S. Weintroub, 989
O'Neil, B. H. St. J.: *Obituary* by Prof. I. A. Richmond, 995
Onset of Œstrus in Ferrets: Effect of Cervical Sympathectomy on the (M. E. Abrams, W. A. Marshall and A. P. D. Thomson), 311
Ontario: Decay of the Sugar Maple (*Acer saccharin*) in (V. J. Nordin), 343
Ontario Research Foundation: Annual Report for 1953, 592
Oordt, Prof. G. J. van: Comparative Endocrinology of Vertebrates, 543
Oosterkamp, Dr. W. J. (Tol, Dr. T., and): Visibility of X-Ray Quantum Fluctuations on Image Intensifier Radiographs, 397
Openshaw, Dr. H. T.: Appointed head of the Chemical Division of the Wellcome Research Laboratories, Beckenham, 113
Opik, Dr. E. J.: A Climatological and Astronomical Interpretation of the Ice Ages and of the Past Variations of Terrestrial Climate, 172
Opium: Determination of the Origin of, by means of the Composition of the Ash (J. C. Bartlet and C. G. Farmilo), 407
Oppenheimer Case: The, 569, 910
Optical Bench: Sensitive Parallax Detector for (Dr. John J. Dowling), 465
Optical Conferences in Italy, 113
Optical Levels: Chemical Action of Ionizing Radiations—Excitation of, by Particles of Relatively Low Energy (Dr. Joseph Weiss), 78
Optical Society of America (Committee on Colorimetry): The Science of Color, *review* by Dr. L. C. Thomson, 666
Optics: Geometrical (Dr. C. Curry), *review*, 152
Optics (Contemporary): Problems in (Conference at the Instituto Nazionale di Ottica), 113
Optics, International Commission for, and others: International Symposium on Infra-red Radiation, 113
Orange Rootstock (Sour): Determination of, by Paper Chromatography (Prof. Raymond M. Sella), 140
Organic Acids: Paper Chromatography of (Prof. F. Smith and D. Spriestersbach), 466
Organic Chemistry: Elsevier's Encyclopaedia of (edited by F. Radt), Series 3, Carboisocyclic Condensed Compounds, Vol. 12*B*, Naphthalene (A), Compounds containing One Naphthalene Nucleus, Naphthoic Acids and their Halogen, Nitrogen and Hydroxyl Derivatives, *review* by Dr. J. W. Cook, 1073
Summer School in (Institute of Chemistry of Ireland), 590
Synthetic (Romeo B. Wagner and Prof. Harry D. Zook), *review* by Prof. John Read, 576
Organic Chemistry in the Arts and Manufactures, *review* by H. M. Langton, 419
Organic Chemistry and Analysis (Dr. Cecil L. Wilson), 591
Organic Components of Bone: Longitudinal Distribution of (G. Curzon), 646
Organic Compounds: Dictionary of (edited by Sir Ian Heilbron and H. M. Bunbury), Vols. 1–4, new edition, *review* by B. A. Ellis, 374
Qualitative Analysis of, by Mass Spectrometry (J. H. Beynon), 735
Organic Liquid Substrates: Surface Films of Poly-di-methyl Siloxanes on (W. H. Banks), 365
Organic Syntheses (edited by Charles C. Price), Vol. 33, 1953, *review* by Prof. John Read, 900
Organic and Histochemical Analysis: Salicyloylhydrazide, a Reagent of Wide Use in (Dr. B. Camber), 1107
Organization and Finance of Adult Education in England and Wales (Ministry of Education), 865
Organisms (Marine): Analyses of, *review* by Dr. L. H. N. Cooper, 808
The Elementary Chemical Composition of (A. P. Vinogradov), translated from the Russian by Julia Efron and Jane K. Setlow, *review* by Dr. L. H. N. Cooper, 808
Organization of Applied Research in Europe (Organization for European Economic Co-operation), 778
Organization for European Economic Co-operation: Organization of Applied Research in Europe, the United States and Canada, Vol. 1, A Comparative Study; Vol. 2, Applied Research in Europe; Vol. 3, Applied Research in the United States and Canada, 778
Organization for European Economic Co-operation (European Productivity Agency): First Meeting of National Technical Information Services Officers, 677
Organization of Scientific Discovery (Prof. P. M. S. Blackett), 164
Organogenesis at the Fern Apex: Effect of Deep and Shallow Incisions on (Prof. C. W. Wardlaw and E. G. Cutter), 734
Orientations in Polyethylene: Perpendicular (A. Keller), 926
Origin of Glycine and Serine in Bakers' Yeast (Chih H. Wang, J. Wendell Davis, Vernon H. Cheldelin and Prof. Bert E. Christensen), 1145
Origin of Opium: Determination of the, by means of the Composition of the Ash (J. C. Bartlet and C. G. Farmilo), 407
Orlans, Dr. E. S., and others: The Species Specificity of Myoglobin, 946
Orléansville, Algeria: Earthquake near, 538
Ornithodoros in Britain: Occurrence of a Species of (J. Hobart and P. E. S. Whalley), 936
Orobanchaceae: Cytology of the Scrophulariaceae and (David J. Hambler), 838
Orr, Lord Boyd: The Numbers of Man and Animals, 817
Orthogonales: Les Fonctions, dans les problèmes aux limites de la physique mathématique (Théodore Vogel), *review* by S. Weintroub, 668
Orthopaedic Surgery: Significance of Metallic Transfer in (Dr. F. P. Bowden, J. B. P. Williamson and P. Gowans Laing), 834
Osborn, Fairfield: The Limits of the Earth, *review* by Prof. L. Dudley Stamp, 422
Osborne, Daphne J., and others: Growth-regulating Activity of certain 2 6-Substituted Phenoxyacetic Acids, 742
Oscillospira: Systematic Position of the Genus (A. A. Tuffery), 838
Osmotic Pressure Measurements: Anomalies in (Dr. L. J. Wood and G. Phillips), 801
Oswald, Prof. H.: Weed Control, 1179
Otte, Dr. H. M.: Transformation in a Titanium–Chromium Alloy, 506
Ova in Sheep: Successful Inter-breed Transfer of (G. L. Hunter, C. E. Adams and L. E. Rowson), 890
Oven (Coke): Heats of Reaction during Carbonization as deduced from Temperature Surveys of a (D. J. Mullard), 1099
Overbeck, C. J.: Awarded a special citation by the American Association of Physics Teachers for noteworthy service, 915
Overseas: Legal Protection of Laboratory Animals, 196
Overseas Information Services: Summary of the Report of the Independent Committee of Enquiry into the, 710

Ovine Pregnancy : Relationship between Maternal Liver Fat and Foetal Weight in (N. L. Ferguson), 277
Ovulation and Mating (Artificially Induced) : Conception in Prepuberal Mice following (Meredith N. Runner and Allen Gates), 222
Owen, Dr. D. E. : Making Friends for the Museum, 333
Owen, Dr. J : Awarded a United States Fellowship by the National Academy of Sciences, Washington, for research at the University of California, 164
Owen, J. A., and others : Use of *p* Chloromercuribenzoic Acid in the Determination of Ascorbic Acid in the presence of Sulphydryl Compounds, 701
Owen, Sir Richard (1804–92), 110
Owen, W. G. : Appointed geographer, Hydrological Survey Department, Uganda, 344
Ox Growth Hormone : Prolonged Stimulation of Wool Growth following Injections of (Dr. K. A Ferguson), 411
Oxalate : Decomposition of, by *Streptomyces* (S. R. Khambata and Prof. J. V. Bhat), 696
Oxbrow, C. F. : Ferroelectric Properties of Single Crystals, 1091
Oxford, Dr. A. E. (Eadie, J. Margaret, and) : A Remarkable Disintegrative Effect of Skatole upon certain Rumen Ciliate Protozoa, 973
Oxford Regional Hospital Board. Grant of £6,000 from the Nuffield Foundation for work on the pathogenesis of rheumatic diseases at the Rheumatic Diseases Research Centre at Stoke Mandeville Hospital, 909
Oxford System of Decimal Classification for Forestry (Prof. E P. Stebbing), 869
Oxidase (D-Amino-acid) Inhibition of (Eva Helmann-Hollaender and Dr. N. Lichtenstein), 559
Oxidation (Glycerol) : Alternate Pathways of, in *Acetobacter suboxydans* (Jens G. Hauge, Tsoo E. King and Prof. Vernon H. Cheldelin), 1104
Oxidation at C_{11} : Antioestrogenic Potencies of various Progesterone Derivatives with (Dr Elvira Mardones, Dr. Rigoberto Iglesias and Prof. A. Lipschutz), 839
Oxidation of Fat : Participation of Coenzyme A in the (Prof. F. Lynen), 962
Oxidation of Ferrocytochrome *c* by Heart Sarcosomes : Phosphorylation coupled with the (Dr. E. C. Slater), 1143
Oxidation Changes in Natural Ilmenite (C. E. Curnow and L. G. Parry), 1101
Oxidative Dissimilation of Glycerol studied with Variants of *Bacillus subtilis* (Prof. J. M. Wiame, S. Bourgeois and R. Lambion), 37
Oxidative Phosphorylation : Efficiency of (Prof. Henry Lardy and J. H. Copenhaver, Jun.), 231
  Reversal and Mechanism of (Prof. P. D. Boyer, A. B. Falcone and W. H. Harrison), 401
Oxley, J. H. : Awarded a postgraduate research scholarship by Courtaulds' Scientific and Educational Trust Fund, 492
Oxygen : Effect of, on the Frequency of Chromosome Aberrations produced by 8-Ethoxycaffeine (Dr. Bengt Kihlman), 561
Oxygen-18 Abundance in Fresh Water (Prof. Willi Dansgaard), 234
'Oxygen-Effect' in Ionizing Irradiation (Dr. H. Laser), 753
Oxygen and Haem in Invertebrates (Prof. H. Munro Fox), 355
Oyaert, W. (Bouckaert, Prof. J. H., and) : A Method of collecting Fluid leaving the Omasum of Sheep, 1195

PALAUD, Mme. S. : Social and Individual Significance of Ageing, 684
Pace, Dr. J, and others : The Lipids in Flour—Oxidative Changes induced by Storage and Improver Treatment, 449
Pacific : Explorers of the—European and American Discoveries in Polynesia (Te Rangi Hiroa) (Peter H. Buck), *review* by J. N. L. Baker, 287
Pacific Islander and Modern Commerce (V. D. Stace), 679
Packington, P. Irwin : Gift of a cabin cruiser to the Department of Zoology, University of Sheffield, for use in coastal and inland waters, 820
Padhi, B., and others : Use of Mercurated Thiazoles as Fungistatic Agents, 516
Padma Vibhushan Doosra Varg (second class) awarded to Dr. H. J. Bhabha, Sir Shanti S. Bhatnagar and Sir K. S. Krishnan by the President of India on Independence Day, 428
Padma Vibhushan Pahela Varg (first class) awarded to Dr. S. Bose and Dr. Z. Husain by the President of India on Independence Day, 428
Page, Sir Frederick Handley : Aircraft Electrical Systems, 1001
Pain, The Relief of (Prof. A. D. Macdonald), 442
  The Relief of (British Association for the Advancement of Science, Section I (Physiology), Discussion on), 629
Pain-producing Substance in Human Plasma : Development of (Desiree Armstrong, Prof. C. A. Keele, Dr. J. B. Jepson and J. W. Stewart), 791
Paints : Cross-Sections of (Joyce Plesters), 490
Pairs of Valves : A New Circuit for Balancing the Characteristics of (R. E. Aitchison), 704
Pais, Dr. A., and Gell-Mann, Dr. M. : Nuclear and Meson Physics, 532
Pakistani Journal : *The Scientist*, a New, 430
Pake, George E., and others : Free Radicals in Biological Materials, 689
Palade, Dr. G. E. : Specimen Techniques in Electron Microscopy, 825
Palaeontology : The Relationship of, to Stratigraphy (Dr. C. J. Stubblefield), 439
  Treatise of, *review* by R. V. Melville, 329
Paléontologie. Traité de (publié sous la direction de Prof. Jean Piveteau), Tome 3, Les formes ultimes d'invertébrés, morphologie et évolution, onychophores (C. Dechaseaux), Arthropodes, proarthropodes (C. Dechaseaux et G. Waterlot), Trilobites (P. Hupé), Crustacés (C. Dechaseaux, N. Grekoff, J. Roger, H. et G. Termier), Myriapodes, Insectes (D. Laurentiaux), Mérostomes, arachnides (G. Waterlot), Échinodermes, hétérostélés, cystidés (L. Cuénot), Blastoïdes (F.-M. Bergounioux), Edrioastéroïdes (J. Piveteau), Crinoïdes, stelleroïdes, ophiocystoïdes (G. Ubaghs), Echinides (H. et G. Termier), Holothurides (M. Deflandre-Rigaud), Stomocordés, ptérobranches et graptolites (G. Waterlot), Machaeridiens, conulaires, hyolithes, tentaculites (H. et G. Termier), *review* by R. V. Melville, 329
Palladin, Prof. A. V. : Chemistry in relation to the Development of the Nervous System, 456
Palmer, Dr. H. P. : The Upper Atmosphere, 335
Palmer, J. A. : Appointed agricultural officer, Fiji, 864
Palmer, J. H. : Effect of Shoot Orientation on Leaf and Shoot Development, 85
Palmer, P. J. : Electrical Potential Analyser for the Solution of the Problem of the Determination of the Torsion Constants for Bulbs and Fillets, 253
Palmer, Dr. Raoul : Fertility, 493
Palmgren, Prof. Axel : Tape for Microsectioning of Very Large, Hard or Brittle Specimens, 46
Palo Seco, Trinidad : On the Excavation of a Shell Mound at (J. A. Bullbrook), *review* by Dr. G. H S. Bushnell, 287
Pan-African Congress on Prehistory : Third Meeting of the, 680
Pancreas : Fine Structure of Exocrine Cells of the (Dr. Cyril E. Challice and Dennis Lacy), 1150
Paneth, Prof. F. A : A New Periodic Table, *review*, 420
Panigrahi, G. : The Species Concept in relation to the British Flora, 245
Panizzi, Luigi, and Scarpati, Maria Luisa : Constitution of Cynarine, the Active Principle of the Artichoke, 1062
Paper Column for Preparative Chromatography : A New (Lennart Hagdahl and Dr. Carl Erik Danielson), 1062
Paracentrotus lividus (Lamarck) in Scotland : Occurrence of (Edith A. T. MacEwen and A. D. Hobson), 752
Paraffins : Liquid-State Equation for Normal (Arthur K Doolittle), 369
Parallax Detector for Optical Bench : Sensitive (Dr. John J. Dowling), 465
Parallelepiped : Point Source and Sink in a (A. C. Sim and L. Lewin), 1155
Paramagnetic Resonance : Stabilization of Free Radicals by Adsorption—Detection by (Dr. D. Bijl, Dr. H. Kainer and A. C. Rose-Innes), 830
Paramagnetic Resonance, a New Property of Coal-like Materials (J. Uebersfeld, A. Etienne and J. Combrisson), 614
Paramagnetic Resonance in Carbonaceous Solids (Dr. D. J. E. Ingram, J. G. Tapley, Dr. R. Jackson, R. L. Bond and A. R Murnaghan), 797
Paraoxon Poisoning : Pentamethonium as an Adjuvant to Atropine in the Therapy of (C. A. de Candole and M. K. McPhail), 552
Parasitic Nematode (Plant) : Environmental Determination of the Sex Ratio of a (Dr. C. Ellenby), 1016
Parathion : Conversion of Schradan and, by an Enzyme System of Rat Liver (A. N. Davison), 1056
Parent : Age of, and Character of Offspring (Prof. K. Mather), 304
Parental Age and Characteristics of the Offspring (New York Academy of Sciences Symposium on), 304
Paris Academy of Sciences : Election of André Couder as a member of the Astronomy Section, 67
  Election of Prof. J. Kampe de Feriet as a correspondent for the Mechanics Section, 67
Park (Queen Elizabeth Forest) : Guide to the (Prof. John Walton), 539
Park, E. C : Resignation as Research Fellow in physics in the University of Birmingham, 820
Park, Prof. T. : The Numbers of Man and Animals, 816
Parker, Dr. A. : Physiological Aspects of the Heating and Ventilation of Houses in Britain, 578
Parkes, Dr A. S. : Comparative Endocrinology of Vertebrates, 543
  Fertility, 493
  The Numbers of Man and Animals, 816
Parkes, M. W., and Sacra, P. : Inability of Acetylcholine Antagonists to protect Mice against the Toxicity of 'Tensilon', 969
Parkin, Dr. E. A. : Insect Pests of Stored Products, 767
Parkinson, Dr. D. : Theory and Practice of Compounding Rubber, 169
Parkinson, J. C. : Appointed assistant conservator of forests, Fiji, 821
Parliament : Government and, a Survey from the Inside (Herbert Morrison), 282
Parliamentary and Scientific Committee : Memorandum on Higher Technological Education, 372
Parrish, Dr. R. G., and others : The Species Specificity of Myoglobin, 946
Parry, L. G. (Curnow, C. E., and) : Oxidation Changes in Natural Ilmenite, 1101
Parsons, P. : Ferroelectric Properties of Single Crystals, 1091
Parsons Memorial Lecture of the Institution of Mechanical Engineers (F Dollin), 681
Partial Sex Linkage in the Mouse (T. C. Carter, Mary F. Lyon and Rita J. S. Phillips), 309 ; (B. M. Slizynski), 310
Participation of Coenzyme A in the Oxidation of Fat (Prof. F. Lynen), 962
Participation of Pyridoxal Phosphate in the Enzymic Synthesis of Serine (R. L. Blakley), 652
Particle-size Calculations : Simplified (C. H. Leigh-Dugmore), 567
Particle-size Characteristics of Fine Powders : Measurement of the (Course by Dr. H. E. Rose in the Faculty of Engineering, King's College, London), 298
Particle-sizing by Successive Counting : Automatic (G. Jordanides and N. H. Chamberlain), 83
Particles : Fields and (Prof. J. A. Wheeler), 914
Particles of Relatively Low Energy : Chemical Action of Ionizing Radiations—Excitation of Optical Levels by (Dr. Joseph Weiss), 78
Partington, Prof. J R. : Seventeenth-Century Chemistry, the Phlogiston Theory and Dalton's Atomic Theory, 291
  Paul Sabatier (1854–1941), 859
Partington, M. W. : Indirect Effect of Ultra-violet Light on Skin Blood Vessels, 134
Pasquill, Dr. F. : Promoted to Senior Principal Scientific Officer in the Scientific Civil Service, 999 , work of, 999
Passage of Glucose and Glycerol across the Red Cell Membrane (Freda Bowyer), 355
Passlow, T. : The Sorghum Midge Diapause, 656
Past Variations of Terrestrial Climate : A Climatological and Astronomical Interpretation of the Ice Ages and of the (Dr. E. J. Öpik), 172
Pasteurella tularensis in Chemically Defined Media : Cultivation of—Effect of Buffers and Spermine (Dr. J. Mager, A. Traub and N. Grossowicz), 747
Pasture : Production of Worm-free Lambs at (C. R. W. Spedding), 611
Pasture Grass : Digestibility of a Sample of, by Calves (D. G. Armstrong, T. R. Preston and R. H. Armstrong), 1182
Paterson, Sir William : Honorary Fellowship of Heriot-Watt College, Edinburgh, conferred on, 164

Pathogen Metabolites (Fungal) : Adventitious-Root Formation by, as a Possible Mechanism of Disease Resistance (Prof. M. A. Mostafa), 86
Pathogens of the Sugar Maple, 343
Pathological Plant Growth : Abnormal and (Brookhaven Symposia in Biology, No. 6), 776
Pathology (General) : Lectures on, delivered at the Sir William Dunn School of Pathology, University of Oxford (edited by Sir Howard Florey), *review* by Prof. John W. S. Blacklock, 99
Pathology (Plant) : Progress and Problems in (Prof. E. C. Stakman), 766
Pathways of Glycerol Oxidation in *Acetobacter suboxydans* : Alternate (Jens G. Hauge, Tsoo E. King and Prof. Vernon H. Cheldelin), 1104
Paton, J. : The Upper Atmosphere, 336
Paton, W. B. : Standards of Library Staff—Recruitment and Training, 912
Patrick, Dr. C. R. : Appointed to a Research Fellowship in chemistry at the University of Birmingham, 1132
Patterson, L. D. : Synthetic Rubbers, 169
Pattison, Dr. F. L. M. : Toxic Fluorine Compounds, 737
Pattle, R. E. : Production of Electric Power by mixing Fresh and Salt Water in the Hydroelectric Pile, 660
Paul, V. J., and Yeddanapalli, Prof. Lourdu M. : Olefinic Nature of Anacardic Acid from Indian Cashew-nut Shell Liquid, 604
Pauli, Prof W. : Atomic Line Spectra, 729
Paulik, F., and others : Differential Thermogravimetry, 885
Paulik, J., and others : Differential Thermogravimetry, 885
Pauling, Prof. Linus : Awarded the Nobel Prize for Chemistry for 1954, 907 ; work of, 907
Pawsey, J. L. : The Physics of the Ionosphere, 867
Payne, D. : Appointed lecturer in agricultural chemistry at the University of Leeds, 863
Payne, K. J. : Aircraft Electrical Systems, 1002
Payne, P. R., and Done, J. : Assay of Tritium-labelled Substances—a 'Combustion Bomb' Method of Preparation of Gas for Counting, 27
Payne, S. (Calcutt, G., and) : Intracellular Sites of Metabolism of 3 : 4 Benzpyrene in Mouse Liver, 841
Payne, T. M. B., and others : Liberation of Amino-acids by Plant Roots in relation to Desiccation, 1110
Payne-Gaposchkin, Mrs. C. : Atomic Line Spectra, 731
    Stars in the Making, *review* by Prof. W. H. McCrea, 852
Peaceful Purposes : Atomic Energy for, 724
Peaceful Uses of Atomic Energy, 67
Peacock, A. T. : The Numbers of Man and Animals, 815
Peacock, F. B. : Awarded a Mond Nickel Fellowship for 1954, 1174
Pear, Prof. T. H. : Animal Behaviour, 859
Pearce, Dr. F. T. : Financial Effect of Labour Turnover, 1180
Pearce, Dr. J. G. : British Cast Iron Research Association—Open Day, 345
Pearce, J. H. : Table of Binomial Coefficients, *review*, 1075
Pearsall, Prof W. H. : Plant Growth and Production, 443
    The Interactions between Acid Soils and Forest Trees, 857
Pearson, G. L., and others : Bell Solar Battery, 163
Pearson, R. B. : Awarded a Research Studentship in Chemistry by British Celanese, Ltd., 681
Peat : International Symposium on (Bord na Móna), 20 ; (T. F. Hurley), 483
Peculiar Nutritional Dermatitis in Pigs (G. Thomas and A. Eden), 553
Pedler, A. E., and others : Effect of Nitrogen Dioxide on the Thermal Decomposition of Ethyl Nitrite, 979
Peel, Talbot : *Obituary* by J. Trevor Spittle, 723
Peel of Apple Fruits : A New Amino-acid in the (Dr. A. C. Hulme), 1055
Peers, Prof. Robert : Science in the Extra-Mural Work of Universities, 166
Pellitory (*Anacyclus pyrethrum* DC.) : Isolation and Structure of an *N*-iso-Butyldienediynamide from (Dr. L. Crombie), 832
Pelvic Fin : A Supernumerary, in the Powan (*Coregonus clupeoides* Lacépède), (F. W. K. Gervers), 935
Pelvic Relaxation in Sheep (Mrs. E. G. Bassett and D. S. M. Phillips), 1020
Pendergrast, J. G., and others : Classification of the Terrestrial Heteroptera (Geocorisae), 91
Penetration of Monomolecular Layers of Nerve Lipoids : Local Anaesthetic Potency and (Dr. J. C. Skou), 318
Penicillamine-Cysteine : A New Mixed Disulphide—(Milton Tabachnick, Herman N. Eisen and Bernard Levine), 701
Penicillinase : Iodometric Assay of (C. J. Perret), 1012
Penman, Dr. H. L. : Problems of Water Supply, *review*, 714
Penn, Jack, and others : Staining Reactions of Elastic Fibres with special reference to 'Elastotic Degenerations' in the Human Skin, 789
Penney, Sir William : Appointed a member of the United Kingdom Atomic Energy Authority, 64
Pennybacker, J. B. : The Relief of Pain, 630
Penrose, Prof. L. R. : Genetics in relation to other Biological Sciences, 673
Penrose, Prof. L. S. : Chemistry in relation to the Development of the Nervous System, 457
    The Numbers of Man and Animals, 816
Pentamethonium as an Adjuvant to Atropine in the Theory of Paraoxon Poisoning (C. A. de Candole and M. K. McPhail), 552
Pentelow, F. T. K. : River Purification, *review* by B. A. S., 152
    Food from Fresh Waters, *review*, 1120
Pentoses associated with Jute α-Cellulose (Dr. D. B. Das, M. K. Mitra and J. F. Wareham), 228 ; (Dr. P. B. Sarkar), 229
Periodic Table of the Elements based on the Structure of the Atom : A New (Dr. S. I. Tomkeieff), *review* by Prof. F. A. Paneth, 420
Periodical Publications in South Asia : Union Catalogue of Learned (Indian Library Association), Vol. 1, 342
Periodicals : Subject Index to (now published in quarterly issues), 589
Periodicals (Turkish) : Bibliography of Articles appearing in, No. 5, 432
Periodicals published in the Indo-Pacific Area : List of Scientific and other (Indo-Pacific Fisheries Council), second edition, 962
Periodicals from The Netherlands : Scientific Books and (Exhibition at the Science Library, London), 998
Periods of Incubation and Infection of an Infectious Disease : A Statistical Method of Estimating the (Norman T. J. Bailey), 139
Peritrophic Membrane in Diplopoda : Presence of a (Mrs. Betty Mason and Owen Gilbert), 1022
Perkin Medal of the Society of Dyers and Colourists awarded to Dr. Arthur Zitcher, 636
Perlmann, Dr. Gertrude E. : Phosphorus Linkages in α-Casein, 273
Permanent Magnet Association—Central Research Laboratory, 1080
Permeability to Water of the Lamprey Integument (M. W. Hardisty), 360
Pernow, P. (Euler, Prof. U. S. v., and) : Effects of Intraventricular Administration of Substance P, 184
Perpendicular Orientations in Polyethylene (A. Keller), 926
Perret, C. J. : Iodometric Assay of Penicillinase, 1012
Perring Scholarship awarded to G. E. Smith, 680
Perrott, Sir Donald : Appointed a member of the United Kingdom Atomic Energy Authority, 64
Personnel Management : Scholarships for (Institute of Personnel Management), 910
Personnel Management, Institute of : Scholarships for Personnel Management, 910
    Annual Conference (T. H. Hawkins), 1088
    Broadsheet on Shift Systems in Industry (F. P. Cook), 1093
Persson, Rolf : Measurements on the Neutron Multiplication in a System of Uranium Rods and Ordinary Water, 265, *erratum*, 636
Perturbing Action of the Earth on Meteor Streams (L. Kresak), 826
Pest Infestation Laboratory, Slough : Annual Report for 1953, 491
Pests on Horticultural Planting Material : Diseases and (P. Aitkenhead and Dr. J. A. Tomlinson), 163
Pests and Diseases : Soil-borne (Association of Applied Biologists Symposium on), 768
Peters, Dr. B. G. : Plant Nematodes, 769
Peters, Dr. D., and Stoeckenius, W. : Structural Analogies of Pox Viruses and Bacteria, 224
Peters, Sir Rudolph : Retirement from the Whitley professorship of biochemistry in the University of Oxford, 160 ; work of, 160
    Chemistry in relation to the Development of the Nervous System, 456
Petersen, H. L. : Weed Control, 1178
Peterson, R. L. : Social and Individual Significance of Ageing, 684
Petroleum : The Story of (Sir Frank Whittle), 1040
Petroleum, Institute of (Spectroscopic Panel of the Hydrocarbon Branch) : Conference on Molecular Spectroscopy, 636, 1165
Pets : Monkeys as, *review* by Dr. L. Harrison Matthews, 418
Petty, Sir William—Portrait of a Genius (E. Strauss), *review* by Dr. A. R. Hall, 573
Pfaffman, C. (Mozell, M. M., and) : Odour Research, 303
Pfeiffer, Heinz G., and Zemany, Paul D. : Trace Analysis by X-Ray Emission Spectrography, 397
Pflanze : Entwicklungs- und Bewegungsphysiologie der (Dr. Erwin Bunning), dritte Auflage, *review* by Dr. E. Ashby, 285
Phaff, H. J. (Demain, A. L., and) : Composition and Action of Yeast Polygalacturonase, 515
Phage labelled with Phosphorus-32 : Effect of Temperature on the Inactivation of (C. Castagnoli and F. Graziosi), 599
Phage Specific for *Streptomyces scabies* : Isolation of a (P. H. S. Newbould and E. H. Garrard), 997
Phanomenologie (Transzendentale) : Die Krisis der Europaischen Wissenschaften und die (Edmund Husserl), herausgegeben von Walter Biemel, *review* by F. L. G. Rawlins, 666
Pharmaceutical Conference, 1954 : British, 780
Phaseolus lunatus : A Further Serological Distinction between the Haemagglutinins of *Dolichos biflorus* and (Lieut.-Colonel G. W. G. Bird), 1015
Phenetidine in Urine (Dr. M. Speček), 933
Phenology—the Study of the Seasons (Dr. C. B. Williams), 445
Phenoxyacetic Acids (2 : 6-Substituted) : Growth-regulating Activity of certain (Daphne J. Osborne, Prof. G. E. Blackman, R. G. Powell, F. Sudzuki and S. Novoa), 742
Philbin, Eva M. : Institute of Chemistry of Ireland—Summer School in Organic Chemistry, 590
Phillipp, W. : Aircraft Electrical Systems, 1002
Philips Serving Science and Industry, Vol. 1, No. 1, 587
Philips Co.'s research team : Electron Optics, 825
Phillips, Dr. A. F. (Cater, Dr. D. B., and) : Measurement of Electrode Potentials in Living and Dead Tissues, 121
Phillips, Dr. A. W. H. : Title of University of London reader in economics conferred on, 1174
Phillips, D. S. M. (Bassett, Mrs. E. G., and) : Pelvic Relaxation in Sheep, 1020
Phillips, E. W. J. : Influence of Leaf Activity on the Composition of the Wood Cell Wall, 85
Phillips, G. (Wood, Dr. L. J., and) : Anomalies in Osmotic Pressure Measurements, 801
Phillips, Margaret (Collier, Dr H. O. J., and) : Some 2 : 4-Diaminopteridines as Folinic Acid Antagonists, 180
Phillips, Rita J. S., and others : Partial Sex Linkage in the Mouse, 309
Phillips, W. J. : Appointed geologist, Uganda, 821
Philosophy at the University College of North Staffordshire, 206
Philosophy (Eddington's) : The Sources of (Prof. H. Dingle), 727
Philosophy of Aborigines : Social Life and, *review* by Mrs. Sonia Cole, 623
Philpot, J. St. L., and Stanier, J. E. : Electrophoretic Migration of Contents of Intact Liver Nuclei, 651
Phlogiston Theory and Dalton's Atomic Theory : Seventeenth-Century Chemistry, the (Prof. J. R. Partington), 291
Phosphate (Pyridoxal) : Participation of, in the Enzymic Synthesis of Serine (R. L. Blakley), 652
Phosphate Action (Pyridoxal) : Competitive Inhibition of, by Toxopyrimidine Phosphate in the Tyrosine Decarboxylase System (Dr. Katashi Makino and Masahiko Koike), 1056
Phosphors : Scintillation Counters and, *review* by Dr. A. R. Crathorn, 810
Phosphorus : Mycorrhizal Uptake and Translocation of (Dr. J. L. Harley and Dr. J. K. Brierley), 776
Phosphorus-32 : Chemical Form of, produced in Aluminium by Bombardment with Nitrogen (Dr. G. A. Chackett and K. F. Chackett), 232
    Effect of Temperature on the Inactivation of Phage labelled with (C. Castagnoli and F. Graziosi), 599
    Uptake of, by Mycorrhizal Plants (T. M. Morrison), 606
Phosphorus Linkages in α-Casein (Dr. Gertrude E. Perlmann), 273
Phosphorylation (Oxidative) : Efficiency of (Prof. Henry Lardy and J. H. Copenhaver, Jun.), 231
    Reversal and Mechanism of (Prof. P. D. Boyer, A. B. Falcone and W. H. Harrison), 401

Phosphorylation coupled with the Oxidation of Ferrocytochrome c by Heart Sarcosomes (Dr. E. C. Slater), 1143
Photoelastic Effects in Microscopic Fibres (A. J. Cruise), 923
Photoelasticity: Courses and demonstrations on (University College, London), 540
Photographic Recording of Cathode Ray Tube Traces (F. B. Cope), 137
Photographic Society, Royal (Kinematograph Group): Exhibition of Kinematography, 681
Photographic Society, Royal (Scientific and Technical Group): Autumn Conference (The Scientific and Technical Applications of Photography), 432
Photographs of Serial Sections of the Lung projected rapidly in Sequence using 16-mm. Film (Dr. Brian E. Heard), 319
Photography: The Scientific and Technical Applications of (Scientific and Technical Group of the Royal Photographic Society Conference on), 432
  Some New Methods of Fast (Dr. J. S. Courtney-Pratt), 164
Photolysis of Chlorine Dioxide and Absolute Rates of Chlorine Monoxide Reactions (F. J. Lipscomb, Prof. R. G. W. Norrish and Dr. G. Porter), 785
Photoperiodic Control of Germination in Seed of Birch (*Betula pubescens* Ehrh.), (M. Black and Dr. P. F. Wareing), 705
Photopic Sensitivity Curves: Electroretinal (Dr. E. P. Johnson and T. N. Cornsweet), 614
Photosynthesis by Isolated Chloroplasts (Prof. Daniel I. Arnon, Dr. M. B. Allen and Dr. F. R. Whatley), 394
Phthalein Dyes and Heated Foodstuffs: Reaction between (Allan Frolich), 879
Physical Chemistry of Metals (Dr. Lawrence S. Darken and Dr. Robert W. Gurry), *review* by Prof. F. C. Thompson, 624
Physical and Inorganic Chemistry at Belfast, 110
Physical Constants of Hydrocarbons (Gustav Egloff), Vol. 5, Paraffins, Olefins, Acetylenes and other Aliphatic Hydrocarbons, *review* by Dr. E. F. G. Herington, 1164
Physical Research Laboratory, Ahmedabad (Dr. K. R. Ramanathan), 1078
Physical Society: Guthrie Lecture (Sir Geoffrey Taylor), 113
  Annual Report for 1953, 120
  Election of Officers, 120
  Reprint of the first five Rutherford Lectures, 161
  Conference on the Physics of the Ionosphere, 163, 866
  Seventh Rutherford Lecture (Prof. P. M. S. Blackett), 164
  Duddell Lecture (Prof. A. C. B. Lovell), 164
  Charles Vernon Boys Lecture (Dr. J. S. Courtney-Pratt), 164
  Autumn Meeting (A Survey of Field Theory), 863
  Annual Exhibition of Scientific Instruments and Apparatus, 955
Physical Society (Institute of Physics and the): Colloquium on New Forms of Thermionic Cathode, 1176
Physical and Biological Sciences: Periodicals in South Asia on the, 342
Physical and Chemical Aspects of Basic Mechanisms in Radiobiology: Proceedings of an Informal Conference held at Highland Park, Illinois 1953 (edited by John L. Magee, Martin D. Kamen and Robert L. Platzman), 389
Physical and Chemical Characteristics of the Profundal Zone of Lakes: Biological, (International Union of Biological Sciences Symposium on), 1136
Physical and Thermodynamic Properties of Hydrocarbons and related Compounds: Selected Values of—Comprising the Tables of the American Petroleum Institute Project 44 (Prof. Frederick D. Rossini, Prof. Kenneth S. Pitzer, Raymond L. Arnett, Rita M. Braun and Prof. George C. Pimentel), *review* by H. B. Milner, 54
Physics (Prof. Noel C. Little), *review*, 152
Physics: Low-Temperature (British Association for the Advancement of Science Conference on), 770
  Meson (Prof. Robert E. Marshak), *review* by Dr. G. D. Rochester, 97
  Modern, for Degree Students, *review* by R. W. Haywood, 240
  Nobel Prize for, for 1954 awarded jointly to Prof. Max Born and Prof. W. Bothe, 907
  Nuclear and Meson (International Union of Pure and Applied Physics and Unesco Conference on), 530
  The Revolution in (Louis de Broglie), *review* by Prof. W. H. McCrea, 762
  Theoretical, at King's College, London, 250
  Use of Dimensions in, *review* by Dr. H. Lipson, 330
Physics in Israel (S. Weintroub), 591
Physics (Applied), British Journal of (edited by Dr. H. R. Lang), Vol. 4, 1953, and Supplement No. 2, Static Electrification, *review*, 376
Physics (Experimental): Principles of, *review* by Dr. S. Whitehead, 712
Physics (Nuclear): Progress in (edited by O. R. Frisch), Vol. 2, *review* by Sir John Cockcroft, 150
  Recent Developments in (Sir John Cockcroft), 438
Physics (Solid State): Introduction to (Prof. Charles Kittel), *review*, 287
Physics, Institute of: Award of Bowen Prizes for 1953 for Papers on Scientific Instrumentation, 208
  Annual Report for 1953, 259
  Election of Officers, 260
  British Journal of Applied Physics (edited by Dr. H. R. Lang), Vol. 4, 1953, and Supplement No. 2, Static Electrification, *review*, 376
  Memorandum on Gamma-Ray Sources for Radiography, second edition, 726
  Handbook of the International Conference on Electron Microscopy, London 1954, 826
  Catalogue of Recent Publications, 1174
Physics, Institute of (X-Ray Analysis Group): Autumn Conference on the Structure and Texture of Metals, 298
Physics, Institute of, and the Physical Society: Colloquium on New Forms of Thermionic Cathode, 1176
Physics, International Union of: Conference on Defects in Crystalline Solids, 377
Physics, International Union of, and others: International Symposium on Infra-red Radiation, 113
Physics, Swedish National Committee for: Seventh General Physics Conference, 727
  Rydberg Centennial Conference on Atomic Line Spectra, 729
  Sixth General Physics Conference (1952), 863
Physics (Pure and Applied), International Union of, and Unesco: Conference on Nuclear and Meson Physics, 530
Physics Conference: Sixth General, 1952 (Swedish National Committee for Physics), 863
Physics Societies of Yugoslavia: Federation of Mathematics and—Congress in Zagreb (Stevan Dedijer), 1179
Physics of Clouds and Precipitation (Swiss Federal Commission for the Study of Hail Formation and Hail Prevention International Symposium on), 957
Physics of Experimental Method (Dr. H. J. J. Braddick), *review* by Dr. S. Whitehead, 712
Physics of the Ionosphere (Physical Society Conference on), 163, 866
Physics of the Solid State (Prof. N. F. Mott), 377
Physics of Synthetic Fibres: Chemistry and (Plastics and Polymer Group of the Society of Chemical Industry Symposium on), 116
Physics of Viruses (Ernest C. Pollard), *review* by H. L. Nixon, 989
Physics, Chemistry and Biology: Nuclear Science in, *review* by Dr. E. Bretscher, 1162
Physics and Engineering: Relaxation in, *review* by Prof. G. Temple, 714
Physiological Aspects of the Heating and Ventilation of Houses in Britain (British Association for the Advancement of Science, Section I (Physiology), Discussion on), 577
Physiological Chemistry: Essentials of (Prof. Arthur K. Anderson), fourth edition, *review* by Prof. J. N. Davidson, 764
Physiological Society (British Association for the Advancement of Science Section I (Physiology) and the): Discussion on Localization of Function in the Cerebral Cortex, 718
Physiology in Hungary (Dr. Joseph Needham and Dr. Dorothy M. Needham), 545
Physiology at Queen Elizabeth College, 205
Physiology (Plant): Annual Review of (edited by Daniel I. Arnon and Leonard Machlis), Vol. 5, *review* by Prof. Walter Stiles, 1074
Physiology or Meta-physiology?, *review* by J. R. Bendall, 477
Physiology of Contraction in Body and Heart Muscle: Chemical (Prof. A. Szent-Györgyi), *review* by J. R. Bendall, 477
Physiology and Medicine: Nobel Prize for, for 1954 awarded jointly to Prof. John F. Enders, Prof. Frederick C. Robbins and Prof. Thomas H. Weller, 818
Physique Mathématique: Les Fonctions orthogonales dans les problèmes aux limites de la (Théodore Vogel), *review* by S. Weintroub, 668
Phyto-Sanitary Convention for Africa South of the Sahara, 725
Phytogeographical Writings of Sir Joseph Hooker, *review* by Prof. Ronald Good, 6
Phytopathogen (Fungal): Effect of Streptomycin on the Host-Pathogen Relationship of a (Dr. K. O. Muller, J. H. E. Mackay and Janet N. Friend), 878
Phytophthora palmivora Sporangia: Use of Ultra-violet Fluorescent Substances for Observations on Dispersal of (C. A. Thorold), 409
Piaget's Recent Psychological Studies: Development of Logical and Mathematical Concepts— (Dr. W. Mays), 625
Piaggio, Prof. H. T. H.: A. W. Conway—Selected Papers, *review*, 479
Pickering, Prof. G. W.: Appointed a member of the Medical Research Council, 636
Pickup, B.: Developments in Testing Rubber, 169
Pickworth, Jenny, and others: Structure of Vitamin B_{12}—X-Ray Crystallographic Evidence on the Structure of Vitamin B_{12}, 1169
Pieces of Grey Tin: Formation of Compact (L. J. Groen), 836
Pierce, J. A., and others: World-wide Frequency and Time Comparisons by means of Radio Transmissions, 922
Pig, Dog and Cat: Lingual Proprioception in (Mary E. Law), 1107
Piggott, Prof. Stuart: The Neolithic Cultures of the British Isles, *review* by Prof. V. G. Childe, 575
Piggott, W. R.: The Physics of the Ionosphere, 867
Pigmentation (Locust): A Possible Endocrine Mechanism controlling (B. Nickerson), 357
Pigmented Systems: Rheology and Settlement of (Oil and Colour Chemists' Association Symposium on), 344
Pigments: Chemistry of some Natural, 990, *erratum*, 1132
Pigs: A Peculiar Nutritional Dermatitis in (G. Thomas and A. Eden), 553
  Lungworms (*Metastrongylus* spp.) in, and their Development in the Guinea Pig (Dr. Diana Rowan Dunn and Prof. E. G. White), 1193
Pile (Hydroelectric): Production of Electric Power by mixing Fresh and Salt Water in the (R. E. Pattle), 660
Pile Irradiation of Polyethylene Terephthalate ('Terylene'), (Miss Audrey Todd), 613
Pilkington, Sir Harry: British Industry and Scientific Man-power, 779
Piltdown Bones and 'Implements' (Meeting of the Geological Society on), 61; (Prof. M. F. Ashley Montagu), 65
Pimentel, Prof. George C., and others: Selected Values of Physical and Thermodynamic Properties of Hydrocarbons and related Compounds—Comprising the Tables of the American Petroleum Institute Project 44, *review* by H. B. Milner, 54
Pincher, Chapman: Sleep, How to Get More of It, *review* by Prof. N. Kleitman, 198
Pincus, Dr. Gregory: Mammalian Germ Cells, *review*, 899
Pinfield, S., and others: Submerged Culture Production of Diphtheria Toxin, 557
Pinhey, G. W.: Awarded the Yarrow Scholarship in Marine Engineering by the Institution of Naval Architects, 864
Pinsky, A., and others: Classification of the Antifungal Antibiotics from *Bacillus subtilis*, 1190
Pinus radiata Forests in New Zealand: Insects of (G. B. Rawlings), 1087
Pioneer Plant Geography, the Phytogeographical Researches of Sir Joseph Dalton Hooker (Dr. W. B. Turrill), *review* by Prof. Ronald Good, 6,
Pipelines and Storage Tanks: Cathodic Protection of (V. A. Pritula), *review*, 376
Pippard, Dr. A. B.: Theory of Superconductivity, *review*, 376
Pippard, Prof. A. J. Sutton: *Obituary of Sir Roderic Hill*, 773
Pirie, N. W.: An Assortment of Proteins, *review*, 762
  Factors Controlling Biological Multiplication, 815
Pitfalls in the Collection of Data from Firms (Acton Society Trust Conference on), 500
Pitt, Frances: The Heron, *review*, 576
Pitt, G. J., and others: Infra-Red Spectra of Coals, 1098

Pituitaries (Human) : Extraction of ACTH from (C. L. Hewett, B. Cruickshank and A. R. Currie), 745
Pituitary Extracts Inactivation of the Chromatophore-expanding Activity of, by Ascorbic Acid (Dr. Marg. Holzbauer and Dr. R. Rigler), 877
Pituitary Glands (Beef) : Adrenocorticotrophic Activity of Melanophore-expanding Hormone Preparations from (Dr. B. G. Benfey, Dr. M. Saffran and A. V. Schally), 1106
Pituitary Growth Hormone : Enhancement of Insulin Action by (P. J. Randle), 1053
Pituitary Hormone (Posterior) : Effect of, on the Release of Adrenocorticotrophic Hormone (Shunji Itoh and Akira Arimura), 37
Pituitary Stalk Section : Effect of, on Light-induced Œstrus in the Ferret (B. T. Donovan and Prof. G. W. Harris), 503
Pitzer, Prof. Kenneth S., and others : Selected Values of Physical and Thermodynamic Properties of Hydrocarbons and related Compounds—Comprising the Tables of the American Petroleum Institute Project 44, *review* by H. B. Milner, 54
Piveteau, Prof. Jean (publié sous la direction de) : Traité de paléontologie, Tome 3, Les formes ultimes d'invertébrés, morphologie et évolution, onychophores (C. Dechaseaux), Arthropodes, proarthropodes (C. Dechaseaux et G. Waterlot), Trilobites (P. Hupé), Crustacés (C. Dechaseaux, N. Grekoff, J. Roger, H. et G. Termier), Myriapodes, Insectes (D. Laurentiaux), Mérostomes, arachnides (G. Waterlot), Échinodermes, hétérostélés, cystidés (L. Cuénot), Blastoides (F.-M. Bergounioux), Edrioastéroides (J. Piveteau), Crinoides, stelléroides, ophiocystoides (G. Ubaghs), Echinides (H. et G. Termier), Holothurides (M. Deflandre-Rigaud), Stomocordés, ptérobranches et graptolites (G. Waterlot), Machaeridiens, conulaires, hyolithes, tentaculites (H. et G. Termier), *review* by R. V. Melville, 329
Placental Transfer of a High Molecular Ferric Carbohydrate (Prof. Gunnar Nylander), 310
Plague The Conquest of (Dr. L. Fabian Hirst), *review* by Sir Arthur S. MacNalty, 1071
Planck Energy Spectrum The Maximum of the (R. N. Bracewell), 563
Plant Cells : The Cultivation of Animal and (Philip R. White), *review* by Dr. Honor B. Fell, 809
Plant Cultivation in Saline and Brackish Water (Dr. A. Allsopp), 782
Plant Diseases : Forecasting and Assessment of (Association of Applied Biologists Symposium on), 769
Plant Extracts : Enzymic Decarboxylation of γ-Methyleneglutamic Acid by (L. Fowden), 208
Plant Genera (Papers of a Symposium of the American Society of Plant Taxonomists and the Botanical Society of America), 71
Plant Geography : Pioneer—The Phytogeographical Researches of Sir Joseph Dalton Hooker (Dr. W. B. Turrill), *review* by Prof. Ronald Good, 6
Plant Growth : Abnormal and Pathological (Brookhaven Symposia in Biology, No. 6), 776
Plant Growth and Production (Prof. W. H. Pearsall), 443
Plant Growth-regulating Substances (Association of Applied Biologists Symposium on), 767
Plant Life in Malaya (Prof. R. E. Holttum), *review* by Prof C. W. Wardlaw, 624
Plant Mitochondria : Storage of (J. M. Tager), 932
Plant Morphology : Experimental, *review* by Dr. E. Ashby, 285
Plant Nematodes (Association of Applied Biologists Symposium on), 769
Plant Nutrition · Radioactive Tracers in (P. P. Martin and R. Scott Russell), 384
Plant Parasitic Nematode . Environmental Determination of the Sex Ratio of a (Dr. C. Ellenby), 1016
Plant Pathology : Progress and Problems in (Prof. E. C Stakman), 766
Plant Physiology Annual Review of (edited by Daniel I. Arnon and Leonard Machlis), Vol. 5, *review* by Prof. Walter Stiles, 1074
Plant Respiration (Dr. W. O. James), *review* by Prof. W. Stiles, 328
Plant Roots : Liberation of Amino-acids by, in relation to Desiccation (H. Katznelson, J. W. Rouatt and T. M. B. Payne), 1110
Plant Species : The Nature of, 245
Plant Tissue Extract Synthesis of Sucrose by a Partially Purified (Dr. J F. Turner), 692
Plant Tissues : Mechanical Separation of (C G. Jarman), 890
Plant Viruses and Virus Diseases (Association of Applied Biologists Symposium on), 767
Planting Material (Horticultural) : Diseases and Pests on (P. Aitkenhead and Dr. J. A Tomlinson), 163
Plants : Absorption of Ions by (D. Reichenberg and J. F. Sutcliffe), 1047
  Amino-Acid Content of (K. Mansford and Dr. R. Raper), 314
  Correlation between Endogenous Auxin and its Destruction *in vivo* by 2 : 4-Dichlorophenoxyacetic Acid in (James H. M. Henderson and Dawson C. Deese), 967
  Respiration in, *review* by Prof. W. Stiles, 328
Plants, Quebec Society for the Protection of · Thirty-fourth Report, 540
Plants (Fossil) : An Introduction to the Study of (Prof. John Walton), second edition, *review*, 528
Plants (Higher) : Crossed Lamellar Structure in (A. B. Wardrop), 546
Plants (Mycorrhizal) Uptake of Phosphorus-32 by (T. M. Morrison), 606
Plants during Growth : Pyrophosphatases in (Dr. B. Naganna and C. E. Sripathi), 593
Plants Infected with Tobacco Mosaic Virus · Rapid Extraction of Intact Crystalline Inclusions from the Cells of (Dr Miguel Rubio Huertos), 313
Plasma (Human) : Development of Pain-producing Substance in (Desiree Armstrong, Prof. C. A. Keele, Dr. J. B. Jepson and J. W. Stewart), 791
Plasmas in the Rare Gases · Non-isothermal (R. D. Craig and Dr. J. D. Craggs), 367
Plastic Materials Exhibition in Paris : Chemical and, 540
Plastics : The Wonder of (Dr J. C. Swallow), 1040
Plastics Institute · Christmas Lecture for Young Persons (Dr. J. C. Swallow), 1040
Plastics and Fibers · Fundamental Principles of Polymerization—Rubbers, (Dr. G. F. D'Alelio), *review* by Prof. H. W. Melville, 52
Platelet Suspensions in the Thromboplastin Generation Test · A Brain Extract as a Substitute for (Dr. W. N. Bell and H. G. Alton), 880
Plates of Grey Tin . Formation of (L. J. Groen and W. G. Burgers), 587
Platinum : Effect of Vapours of Halogen Compounds on the Emission of Positive Ions from (Prof. Nobuji Sasaki and Masaru Onchi), 84
Platinum Medal of the Institute of Metals to be presented to Dr. George Masing, 113
Platonic Renaissance in England (Prof. Ernst Cassirer), translated by James P. Pettegrove, *review* by F. I. G. Rawlins, 475
Platonists . The Cambridge, *review* by F. I. G. Rawlins, 475
Platt, Dr. J. B. . Nuclear and Meson Physics, 531
Platzman, Robert L., and others (edited by) : Physical and Chemical Aspects of Basic Mechanisms in Radiobiology—Proceedings of an Informal Conference held at Highland Park, Illinois, 1953 (National Academy of Sciences, Washington, Publication 305), 389
Pleistocene Geology and Archæology of Northern France, *review* by M. C. Burkitt, 987
Pleistocene Period and Work for the Amateur Geologist (H. E. P. Spencer), 70
Plesters, Joyce : Cross-Sections of Paints, 490
Plowden, Sir Edwin : Appointed chairman of the United Kingdom Atomic Energy Authority, 64
Pluvinage, P. : Atomic Line Spectra, 730
Plyler, E. K. : Molecular Spectroscopy, 1166
Plywood : Strength Properties of, 383
3-Plywoods of a Standard Thickness Comparison of, Part I (W T. Curry), 383
Pocock, Dr. R. W. : *Obituary* by T. H. Whitehead, 294
Podsols (Acid Sandy) Micro-fungal Population of (Dr. Ethel I. McLennan and Sophie C Ducker), 1060
Point Source and Sink in a Parallelepiped (A. C. Sim and L. Lewin), 1155
Poisoning (Food), and Food Hygiene (Dr. Betty C. Hobbs), *review* by Osman Jones, 285
Poisoning (Paraoxon) : Pentamethonium as an Adjuvant to Atropine in the Therapy of (C. A. de Candole and M. K. McPhail), 552
Polarization of Proton Spin : Direction of, produced by Elastic Scattering (L. Marshall and J. Marshall), 1184
Polarization of Radio Echoes from Aurora (A. G. McNamara and B. W. Currie), 1153
Polarizing Microscope : Manual of the (Dr. A. F. Hallimond), second edition, *review* by Dr. M. H. Hey, 669
Polarographic Currents for Depolarization Schemes involving Reactions of Higher Order : Methods of Calculation of (Dr. Jaroslav Koutecky), 233
Polarographic Method for the Determination of the Gamma Isomer of Benzene Hexachloride in Cattle Dips (G. W. Walker), 44
Poley, J. Ph. : Dielectric Properties of Tellurite Glasses, 268
Poliomyelitis Virus in Tissue Culture : Interference and Cell Protection by (Dr. G. L. Le Bouvier), 649
Polish Scientific Literature : Catalogue of (Polska Akademii Nauk), Vol. 21 (1945–49), 954
Political and Economic Planning : Broadsheet No. 362, World Population and Resources, 1
Political Systems of Highland Burma, a Study of Kachin Social Structure (E. R. Leach), *review* by Prof. S E Finer, 423
Politics : Human Society in Ethics and (Bertrand Russell), *review* by Prof. T. S. Simey, 1162
Pollard, Ernest C. : The Physics of Viruses, *review* by H. L. Nixon, 989
Pollard, Dr. F. H., and McOmie, Dr. J. F. W. · Chromatographic Methods of Inorganic Analysis, *review* by E. Q. Laws, 1119
Pollard, Dr. F. H., and others Effect of Nitrogen Dioxide on the Thermal Decomposition of Ethyl Nitrite, 979
Polska Akademia Nauk : Catalogue of Polish Scientific Literature, Vol. 21 (1945–49), 954
  Celebrations on the twentieth anniversary of the death of Marie Curie, 959
  Archiwum Budowy Maszyn, 997
Poly-di-methyl Siloxanes on Organic Liquid Substrates : Surface Films of (W. H. Banks), 365
Polyethylene : Perpendicular Orientations in (A. Keller), 926
Polyethylene Terephthalate ('Terylene') · Pile Irradiation of (Miss Audrey Todd), 613
Polyethylene Terephthalate Filaments : Effects of Crystallization on the Glass–Rubber Transition in (D. W. Woods), 753
Polygalacturonase (Yeast) : Composition and Action of (A. L. Demain and H. J. Phaff), 515
Polyion and Counter-ion Concentration : Dielectric Increment of Sodium Alginate as a Function of (Dr. Lars-Goran Allgén), 1155
Polymer (High) Forum : Sixth Canadian, 492
Polymerization : Fundamental Principles of—Rubber, Plastics and Fibers (Dr. G. F. D'Alelio), *review* by Prof. H. W. Melville, 52
Polymerization Reactions occurring during Dinitrophenylation of α-, β- and ϵ-Amino acids with Sanger's Reagent (D. Heikens, Dr. P. H. Hermans and P F. van Velden), 1187
Polymers (Branched) : Synthesis of (M. H. Jones, Prof. H. W. Melville and W. G. P. Robertson), 78
Polymers (Synthetic) : Theory of, *review* by Prof. H. W. Melville, 52
Polymers at Ultrasonic Frequencies · Transition Temperatures of (M Krishnamurthi and G. Sivarama Sastry), 132
Polymethyl Methacrylate at Ultrasonic Frequencies . Transition Temperature of (P. Hatfield), 1186
Polymorphism in the Nematode *Haemonchus contortus* (Rudolphi 1803) Cobb 1898 : Cytological (K. C. Bremner), 704
Polynesia : Explorers of the Pacific—European and American Discoveries in (Te Rangi Hiroa) (Peter H. Buck), *review* by J. N. L. Baker, 287
  Linguistic Studies in (Prof. S H. Elbert and Dr. Alexander Spoehr), 471
Polyols and Ketoses : A New Spray Reagent for Paper Chromatography of (Dr. Paul Godin), 134
Polysaccharides : Restriction of Inflammatory Response by (M. Shilo, B. Wolman and Shlomo Hestrin), 786
Polystyrene: Conductivity induced in, by X-Rays (J. F. Fowler and Dr. F. T. Farmer), 800
Polytetrafluoroethylene : Conductivity induced in, by X-Rays (J. F. Fowler and Dr. F. T. Farmer), 136
Polythene : Electron Irradiation of (A. C. Baskett and C. W. Miller), 364

Pontecorvo, Dr. G. : Genetics in relation to other Biological Sciences, 673
  Social Implications of the Genetics of Man, 960
  A Treatise of Genetics, review, 987
Poole, J. C. F. : Awarded a Locke Research Fellowship by the Royal Society, 1174
Pools : Resistance to Flow of Liquids over Solids by Thin Films extending from the Edge of, or from Menisci (E. B. Bielak, G. F. N. Calderwood and Dr. E. W. J. Mardles), 1069
Pope, Dr. A. : Chemistry in relation to the Development of the Nervous System, 456
Pope, C. G., and others : Submerged Culture Production of Diphtheria Toxin, 557
Popham, F. J., and others Synthetic Rubbers, 169
Popularization of Science : Experiment in the, review by Heinz Von Foerster, 284
Population : Food and, review by Prof. L. Dudley Stamp, 422
  Food Production and, review by Lord Boyd-Orr, 986
Population Conference in Rome : World (Prof. E. Grebenik), 904
Population and Resources : World, 1 ; (Prof. E. P. Stebbing), 678
Population and World Food Supplies : World (Sir E. John Russell), review by Lord Boyd-Orr, 986
Porous Alumina Sample Holders for Differential Thermal Analysis Comparative Performance of Nickel and (T. L. Webb), 686 ; (Dr Robert C. Mackenzie), 688
Porous Carbon Alternation in the Adsorption of Aliphatic Acids on (Dr. John L. Morrison and David M. Miller), 1188
Porridge : The Flavour of (Dr. T. Moran, J. B. Hutchinson and J. Thomlinson), 458
Porter, Dr. G. : Appointed assistant director of the British Rayon Research Association, 1040
Porter, Dr. G., and others : Photolyses of Chlorine Dioxide and Absolute Rates of Chlorine Monoxide Reactions, 785
Porter, Dr. G., and Windsor, M. W. : Molecular Spectroscopy, 1165
Porter, Dr. G. (Norman, Dr. Irwin, and) . Trapped Atoms and Radicals in a Glass 'Cage', 508
Position Effect of the *Rh* Blood-Group Genes (Dr. R. R. Race, Dr. Ruth Sanger, Dr P. Levine, R. T. McGee, Dr. J. J. van Loghem, Miss Mia van der Hart and C. Cameron), 460
Positive Column of High- and Low-Current Arcs (L. A. King), 1008
Positive Ions from Platinum . Effect of Vapours of Halogen Compounds on the Emission of (Prof. Nobuji Sasaki and Masaru Ouchi), 84
Post Office Engineering Research Station, Dollis Hill : Open Day, 905
Postdoctoral Fellowships in Statistics (University of Chicago), 777
Posterior Pituitary Hormone : Effect of, on the Release of Adrenocorticotropic Hormone (Shinji Itoh and Akira Arimura), 37
Postgraduate Fellowships for 1954–55 (National Research Council of Canada), 540
Postgraduate Research Scholarships (Courtaulds' Scientific and Educational Trust Fund, Awards for 1954), 492
Postgraduate Scholarships in Agricultural Subjects (Department of Agriculture for Scotland Awards), 681
Potassium, Calcium, Magnesium and Strontium : Simultaneous Determination of Sodium; by a New Multichannel Flame-Spectrometer (Dr. Bert L. Vallee), 1050
Potato : Science and the, review by Dr. R. N. Salaman, 98
Potato in Health and Disease (Dr. Tatham Whitehead, Dr. Thomas P. McIntosh and William M. Findley), third edition, review by Dr. R. N. Salaman, 98
Potato Root Diffusate : Concentration of, by Vacuum Distillation (N. G. Hague), 1018
Potato Scab An Actinophage for (F. H. S. Newbould and E. H. Garrard), 997
Potato Tuber : Growth- and Inhibiting-Substances in relation to the Rest Period of the (K. L. J. Blommaert), 970
Potatoes : Manganese and Metabolism in (H. C. Rock and B. D. Bolas), 726
Potent Diphtheria Toxin within the Cells of *C. diphtheriae* (Shoki Nishida), 970
Potential Analyser : Electrical, for the Solution of the Problem of the Determination of the Torsion Constants for Bulbs and Fillets (P. J. Palmer), 253
Powan (*Coregonus clupeoides* Lacépède) : A Supernumerary Pelvic Fin in the (F. W. K. Gervers), 935
Powder Metallurgy (Iron and Steel Institute and the Institute of Metals Symposium on), 432
Powder Ridges in a Sound Field (Dr. Mary D. Waller), 368
Powders (Fine) : Measurement of the Particle-size Characteristics of (Course by Dr. H. E. Rose in the Faculty of Engineering, King's College, London), 298
Powell, A. : Awarded a postgraduate research scholarship by Courtaulds' Scientific and Educational Trust Fund, 492
Powell, A. R. : Germanium and Gallium and their Applications, 627
Powell, E. F., and Gough, S. W. : Developments in Testing Rubber, 169
Powell, R. G., and others . Growth-regulating Activity of certain 2 6-Substituted Phenoxyacetic Acids, 742
Power, the late Sir D'Arcy, continued by Le Fanu, W. R. : Lives of the Fellows of the Royal College of Surgeons of England 1930–1951, review by Sir Gordon Gordon-Taylor, 51
Power Industries (British) : Research in—Gas and Electricity, 996 ; Nuclear Power, 996
Power Resources of the World (J. Eccles), 1000
Power and Influence (Lord Beveridge), 759
Power and Influence in the Modern State, 759
Power and Influence : Mass Communication, 709
Pox Viruses and Bacteria : Structural Analogies of (Dr. D. Peters and W. Stoeckenius), 224
Prankerd, T. A. J., and others : Electrophoresis of Human Red-Cell Stroma, 1146
Pratt, Dr. H. R. C. : Promoted to Deputy Chief Scientific Officer in the Scientific Civil Service, 999 ; work of, 999
Pratt, Dr. J. N. : Appointed lecturer in physical metallurgy at the University of Birmingham, 820
Pratt, Dr. P. L. Mechanical Effects of Dislocations in Crystals, 378
Precipitation : Physics of Clouds and (Swiss Federal Commission for the Study of Hail Formation and Hail Prevention International Symposium on), 957
Precise Laboratory Weighing : Balances, Weights and (National Physical Laboratory Notes on Applied Science, No. 7), 1004
Precision Electrical Measurements (Symposium at the National Physical Laboratory), 910
Precursor of 2-Carboxy-Pyrrole in Mucoproteins (Dr. A. Gottschalk), 652
Precursor of a Growth Inhibitor : Chlorophyllide, the Probable (Mrs. G. Blaauw-Jansen), 312
Pregnancy (Ovine) : Relationship between Maternal Liver Fat and Foetal Weight in (N. L. Ferguson), 277
Prehistory : Pan-African Congress on (Third Meeting of the), 680
Prentice, Neville, and Cuendet, L. S. : Chemical Composition of Uredospores of Wheat Stem Rust (*Puccinia graminis tritici*), 1151
Preparation of Aluminium of Extreme Purity by the 'Zone Fusion' Process (Prof. Georges Chaudron), 923
Preparation of Gas for Counting : Assay of Tritium-labelled Substances—a 'Combustion Bomb' Method of (P. R. Payne and J. Done), 27
Preparative Counter-Current Distribution : A New Glass Cell for (M. Verzele and F. Alderweireldt), 702
Prepuberal Mice : Conception in, following Artificially Induced Ovulation and Mating (Meredith N. Runner and Allen Gates), 222
Preservation of Bacteria (D. I. Annear), 359
Preservation of Rural England, Council for the Twenty-eighth Annual Report, 297
Press : Science and the, 847
  The Public Influence of Broadcasting and the (Sir William Haley), 711
Press (Beaverbrook) : The, and the British Council (British Council Staff Association), 162
Press, Frank, and Ewing, Maurice : Microseisms, 302
Pressure : Effects of, upon Collagen (A. J. Cruise), 888
Pressures (Differential) : Measurement of Small, at Low Absolute Pressures (D. I. Gaffee and A. G. Monroe), 756
Pressures (Low Absolute) Measurement of Small Differential Pressures at (D. I. Gaffee and A. G. Monroe), 756
Preston, Prof. R. D., and Ripley, G. W. : Electron Diffraction Diagrams of Cellulose Microfibrils in *Valonia*, 76
Preston, T. R., and others : Digestibility of a Sample of Pasture Grass by Calves, 1182
Price, Charles C. (edited by) : Organic Syntheses, Vol. 33, 1953, review by Prof. John Read, 900
Price, D. G. : Appointed geologist, British Guiana, 864
Price, Dr. Derek J. : Life of Thomas Young, review, 239
Price, Don K. : Government and Science, their Dynamic Relation in American Democracy, review by R. Brightman, 475
Price, W. C. : Molecular Spectroscopy, 1166
Price (Bernard) Institute of Geophysical Research, Johannesburg : Appointment of Prof. A. L. Hales as director, 428 ; work of, 428
Priestley, J. B. : The Industrial Scene, 1089
Primary Standard Weight for Karachi Mint, Pakistan Ten-Tola (L. Oertling, Ltd.), 296
  Manufacture of the (Dr. G. F. Hodsman), 1094
Prime, Dr. C. T. : The Species Concept in relation to the British Flora, 245
Primitive Man The World of (Paul Radin), review by Mrs. Sonia Cole, 623
Primycin, a New Antibiotic (Prof. T. Vályi-Nagy, J. Uri and I. Szilágyi), 1105
Prince, R. H. Appointed the first holder of the Tin Research Institute Fellowship established at University College, London, 864
Principals of Technical Institutions, Association of, and Association of Technical Institutions : Report on the Development of Higher Technological Education, 325
Principles of Experimental Physics, review by Dr. S. Whitehead, 712
Principles of the Measurement of Colour, review by Dr. L. C. Thomson, 666
Principles of Numerical Analysis (Alston S. Householder), review by Dr. L. S. Goddard, 624
Principles of Polymerization : Fundamental—Rubbers, Plastics and Fibers (Dr G. F. D'Alelio), review by Prof. H. W. Melville, 52
Principles of Radar (Members of the Staff of the Radar School, Massachusetts Institute of Technology), third edition by Prof. J. Francis Reintjes and Godfrey T. Coate, review, 7
Principles of Sugar Technology (edited by Pieter Honig), review by H. C. S. de Whalley, 150
Principles and Applications of Chromatography, review, 5
Pringsheim, Prof. E. G. : *Obituary of Prof. F. E. Fritsch*, 293
Pritchard, A. J. : Appointed botanist, Uganda, 821
Pritchard, N. M. : Awarded a Nature Conservancy Research Studentship in Botany, 727
Pritchard, T. O. : Awarded a Nature Conservancy Research Studentship in Botany, 727
Pritula, V. A. : Cathodic Protection of Pipelines and Storage Tanks, review, 376
Problem of the Two Types of Diamond (Prof. G. B. B. M. Sutherland, D. E. Blackwell and W. G. Simeral), 901
Problems of Applied Biology : The Changing (Sir John Russell), 766
Problems in Applied Zoology (Association of Applied Biologists Symposium on), 768
Problems in Plant Pathology : Progress and (Prof. E. C. Stakman), 766
Problems of Utilization of Saline Water : Reviews of Research on (Unesco Arid Zone Programme), 782
Procter Memorial Lecture of the Society of Leather Trades' Chemists : Sixth (Prof. J. T. Randall), 298, 853
Production : *In vitro*, of Tropical Black Earth (Dr. D. G. Hessayon and R. G. Hutton), 612
  Plant Growth and (Prof. W. H. Pearsall), 443
Production of Electric Power by mixing Fresh and Salt Water in the Hydroelectric Pile (R. E. Pattle), 660
Production of Individual, Sized, Droplets by High-Voltage 'Firing' from a Micropipette (H. A. Druett and K. R. May), 467
Production of Silicones—New Plant at Barry, Glamorgan, 1041
Production of Unsaturated Uronides by Bacterial Hyaluronidases (Alfred Linker and Dr. Karl Meyer), 1192
Production of Worm-free Lambs at Pasture (C. R. W. Spedding), 611
Production Engineers, Institution of : Exhibition and Conference, 20
Productivity (Industrial) : Scientific Research and (Sondes Place Research Institute, Occasional Bulletin No. 7), 1130

Productivity Council, British: Industrial Engineering—Report of a visit to the U.S.A. in 1953 of a British Specialist Team on Industrial Engineering, 893
Products (Stored): Insect Pests of (Association of Applied Biologists Symposium on), 767
Professional Civil Servants, Institution of: Evidence submitted to the Royal Commission on the Civil Service, 387
Professional, Technical and Scientific Civil Servants, 387
Profundal Zone of Lakes: Biological, Physical and Chemical Characteristics of the (International Union of Biological Sciences Symposium on), 1136
Progesterone Derivatives with Oxidation at C_{11}: Antioestrogenic Potencies of various (Dr. Elvira Mardones, Dr. Rigoberto Iglesias and Prof. A. Lipschutz), 839
Progesterone in Human Blood and Tissues (Josef Zander), 406
Progress in Nuclear Physics (edited by O. R. Frisch), Vol. 2, *review* by Sir John Cockcroft, 150
Progress and Problems in Plant Pathology (Prof. E. C. Stakman), 766
Proliferation in Grass Spikelets: Vegetative (P. R. Wycherley), 588
Prolonged Stimulation of Wool Growth following Injections of Ox Growth Hormone (Dr. K. A. Ferguson), 411
Promotion of Nature Reserves, Society for the: Handbook for 1953, 162
  Handbook for 1954, 1087
Propane (Liquid): Caution in the Use of, for Freezing Biological Specimens (Dr. John L. Stephenson), 235
Properties of Histones from Malignant Cells: Abnormal (Dr. H. J. Cruft, Dr. C. M. Mauritzen and Dr. E. Stedman), 580
Properties of Materials at Low Temperatures (International Institute of Refrigeration, Bulletin Annexe 1954–2), 297
Properties of Matter (H. N. V. Temperley), *review* by G. R. Noakes, 1120
Properties of 'Nimonic 95', 726
Properties of the Non-Calcareous Material in the Shell of *Anodonta cygnea* (G. E. Beedham), 750
Properties of Tellurite Glasses: Dielectric (J. Ph. Poley), 268
Proprioception in Pig, Dog and Cat: Lingual (Mary E. Law), 1107
Prose, A. W.: Estimation of Impurities in Liquid Chlorine by Infra-red Absorption Spectrophotometry, 467
Protect Mice: Inability of Acetylcholine Antagonists to, against the Toxicity of 'Tensilon' (M. W. Parkes and P. Sacra), 969
Protecting Cleaned Iron Objects (L. Biek, E. S. Cripps and D. M. D. Thacker), 431
Protection against Betatron and Synchrotron Radiations up to 100 million Electron Volts (National Bureau of Standards, Handbook 55), 340
Protection of Birds for England and Wales, Advisory Committee on the: Appointment of Members, 1086
Protection of Laboratory Animals Overseas: Legal, 296
Protection of Pipelines and Storage Tanks: Cathodic (V. A. Pritula), *review*, 376
Protection of Plants, Quebec Society for the: Thirty-fourth Report, 540
Protective Effect of *dl*-α-Octadecylglycerolether in Mice given Total Body X-Irradiation (T. Edlund), 1102
Protein Concentrates (Lucerne): Nutritive Value of, fed with and without Cholesterol (S. J. Cowlishaw, D. E. Eyles, W. F. Raymond and J. M. A. Tilley), 227
Proteins: The (edited by Hans Neurath and Kenneth Bailey), Vol. 2, Part A, *review* by N. W. Pirie, 762
  Anhydrous Trifluoroacetic Acid as a Solvent for (Joseph J. Katz), 509
  An Assortment of, *review* by N. W. Pirie, 762
  Biological Value of, as influenced by Dietary Vitamin B_{12} (B. R. Baliga, S. Balakrishnan and Dr. R. Rajagopalan), 35
Proteins (Algal): Similarity of (W. Fowden), 820
Proteins (Cytoplasmic): An Improved Resolution of, of Rat Liver after n-Butanol Treatment (G. Adjutantis), 1054
Proteins (Serum): Fractionation of, by Zone Electrophoresis in Glass Powder (C. J. Bradish and Nan V. Smart), 272
Proteins (Tumour): Metabolism and the Occurrence of *d*(—)Glutamic Acid in (Dr. Günther Hillmann, Anneliese Hillmann-Elies and Friedrich Methfessel), 403
Proteins in the Solid State: Infra-red and Ultra-violet Absorption Spectra of (Elton S. Cook, Cornelius W. Kreke, Edward B. Barnes and Werner Motzel), 1144
Proteolytic Enzymes of *Clostridium histolyticum*: Separation of (Robert DeBellis, Ines Mandl, John D. MacLennan and Edward L. Howes), 1191
Proteus vulgaris: Glutathione Breakdown and Transpeptidation Reactions in (Pamela Samuels Talalay), 516
Proton Spin: Direction of Polarization of, produced by Elastic Scattering (L. Marshall and J. Marshall), 1184
Protozoa (Rumen Ciliate): A Remarkable Disintegrative Effect of Skatole upon certain (J. Margaret Eadie and Dr. A. E. Oxford), 973
Protozoa (Soil): Direct Microscopy for Study and Count of (Y. T. Tchan and J. S. Bunt), 656
Proust, J. L. (1754–1826), 586
Prytherch, E. L.: Weed Control, 1178
Psalliota xanthoderma: Psalliotin, the Antibiotic of (Nancy Atkinson), 598
Psalliotin, the Antibiotic of *Psalliota xanthoderma* (Nancy Atkinson), 598
Pseudomycorrhizal Group of Soil Fungi: Test for the (Dr. Ida Levisohn), 408
Psychological Studies: Development of Logical and Mathematical Concepts—Piaget's Recent (Dr. W. Mays), 625
Psychology (Applied), International Association of: Congress, 680
Psychology of Thinking: Recent Studies in the (Prof. L. S. Hearnshaw), 443
Public Accounts, Committee of: Third Report for the Session 1953–54, 537
  Research Expenditure, 537
  University Grants, 537
Public Health Engineering (Peter C. G. Isaac), *review* by H. E. W., 1075
Public Influence of Broadcasting and the Press (Sir William Haley), 711
Public Opinion: Entomology and, 253
Public Policy in the United States: Basic Scientific Research and, 70
Public Works Department, Gold Coast: Appointment of T. W. Brandon as specialist, water examination, 821
Puccinia coronata: Cytology of (R. C. McGinnis), 491
Puccinia graminis tritici: Chemical Composition of Uredospores of Wheat Stem Rust (Neville Prentice and L. S. Cuendet), 1151
Puccinia polysora Underw.: Tolerance to the Maize Rust (R. T. Ellis), 1021
Pugh, H. Ll. D.: Rheology in Mechanical Engineering, 202
Pulkovo Observatory: The Reopening of (D. H. Sadler), 153
Pullin, Dr. A. D. E.: Appointed lecturer in physical chemistry at Queen's University, Belfast, 253
Pulsating Flow: Heat Transfer in (Prof. H. A. Havemann and N. N. Narayan Rao), 41
Pulsatory and Vibrational Phenomena (Division of Industrial and Engineering Chemistry of the American Chemical Society Symposium on), 636
Pulses (Electron): Velocity of (L. L. Whyte, D. L. Richards and Dr. D. Gabor), 398, 681
Pumphrey, Prof. R. J.: Comparative Endocrinology of Vertebrates, 543
Purification: River (F. T. K. Pentelow), *review* by B. A. S., 152
Putnam, L. G.: Grasshopper Research and Control in Canada, 542
Puttick, K. E.: Appointed Armourers and Brasiers' Company Research Fellow, 164
Pycnometer for the Determination of Chlorine in Sea Water: A Chainomatic (D. J. Rochford), 641
Pye, Norman: Appointed to the chair of geography in University College, Leicester, 18; work of, 18
Pyrazine Rings: Condensed Pyridazine and (Cinnolines, Phthalazines Quinoxalines), (J. C. E. Simpson), *review* by Dr. James D. Loudon, 241
Pyridazine and Pyrazine Rings: Condensed (Cinnolines, Phthalazines and Quinoxalines), (J. C. E. Simpson), *review* by Dr. James D. Loudon, 241
Pyridoxal Phosphate in the Enzymic Synthesis of Serine: Participation of (R. L. Blakley), 652
Pyridoxal Phosphate Action: Competitive Inhibition of, by Toxopyrimidine Phosphate in the Tyrosine Decarboxylase System (Dr. Katashi Makino and Masahiko Koike), 1056
Pyrimidines (Halogenated): Incorporation of, into the Deoxyribonucleic Acids of *Bacterium coli* and its Bacteriophages (D. B. Dunn and Dr. J. D. Smith), 305; (Dr. Stephen Zamenhof and Mrs. Gertrude Griboff), 306
Pyrophosphatases in Plants during Growth (Dr. B. Naganna and C. E. Sripathi), 593

QATAR Peninsula: Lower Tertiary Foraminifera of the (Dr. Alan Hilder Smout), *review*, 945
Qualitative Analysis of Organic Compounds by Mass Spectrometry (J. H. Beynon), 735
Quality in Tea: Morphological Basis of (Dr. T. Eden), 844
Quantitative Biological Test Sensitive to Low Doses of Ionizing Radiations (Dr. H. Marcovich), 796
Quantitative Estimation of Amino-Acids: A Paper Chromatographic Method for the (Dr. Anthony L. Levy), 126
Quantitative Infra-Red Analyses of Mixtures (I. R. C. McDonald), 703
Quantum Fluctuations (X-Ray): Visibility of, on Image Intensifier Radiographs (Dr. T. Tol and Dr. W. J. Oosterkamp), 397
Quantum Theory: De Broglie on, *review* by Prof. W. H. McCrea, 762
Quartz and Metal Films: Cathodoluminescence of Air, (Prof. J. B. Birks and W. A. Little), 82
Quartz Crystal Vibrators: Ageing of (H. T. Mitchell), 41
Quastel, Prof. J. H. (Ghosh, Dr. J. J., and): Narcotics and Brain Respiration, 28
Quebec Society for the Protection of Plants: Thirty-fourth Report, 540
Queen Elizabeth College, London: Appointment of Dr. J. A. C. Knox to the University of London chair of physiology, 112, 205
Queen Elizabeth Forest Park: Guide to the (Prof. John Walton), 539
Queen Elizabeth House, a New Centre in Oxford for Colonial Studies, 19
Queen Mary College, London: Appointment of Dr. E. H. Sondheimer to the University of London readership in applied mathematics, 727
Queen's College, Dundee: Appointment of Dr. A. D. Walsh to the chair of chemistry, 586
Queen's University, Belfast: Appointment of Dr. Charles Kemball to the chair of physical and inorganic chemistry, 67, 110
  Appointment of V. C. R. Ford as lecturer in geography, 67
  Appointment of J. Drewery as lecturer in psychology, 67
  Appointment of Dr. W. Schwarzacher as lecturer in geology, 67
  Appointment of Dr. G. W. A. Dick to the chair of bacteriology, 253, 383
  Appointment of Colonel D. R. Crone as lecturer in civil engineering (surveying), 253
  Appointment of Dr. A. D. E. Pullin as lecturer in physical chemistry, 253
  Title of emeritus professor of botany conferred on Prof. James Small, 1040
  Title of emeritus professor of geology conferred on Prof. J. K. Charlesworth, 1040
Quetta: Magnetic Observations at, during the Total Solar Eclipse of June 30 (S. A. A. Kazmi), 706

RABBIT: Serous Cells in Brunner's Glands of the (B. F. Martin), 1195
Rabbit (Wild): Breeding Season of the, in New Zealand (J. S. Watson), 608
Rabbit Blastocyst: A Simplified Method for Spreading the Chromosomes in the (Ole Venge), 608
Racah, G.: Atomic Line Spectra, 730
Race, Dr. R. R., and others: A Position Effect of the *Rh* Blood-Group Genes, 460
Radar: Principles of (Members of the Staff of the Radar School, Massachusetts Institute of Technology), third edition by Prof. J. Francis Reintjes and Godfrey T. Coate, *review*, 7
Radar Research Establishment, Malvern: Conference on the Electronic Band Structure of Solids, 949
Radar Target: Use of a Gaseous Discharge as an Identifiable (G. W. G. Court), 367
Radcliffe, J. M.: The Electronic Band Structure of Solids, 950

Rademacher, Prof. B. : Weed Control, 1179
Radiation : Callendar's 'Radio-Balance' for Determining the Thermal Energy of (W. B. Mann), 634
  Heat Transfer by (J. H. McGuire), 490
Radiation (Electromagnetic) : T. K. Sidey Summer-time Award for Research on (Royal Society of New Zealand), 955
Radiation (Infra-red) : International Symposium on (International Union of Physics, the International Commission for Optics, and others), 113
Radiation Dosimetry of Iodine-132 (E. W. Emery and N. Veall), 889
Radiation Hazards in Industry (British Occupational Hygiene Society Conference on), 209, 777
Radiations (Betatron and Synchrotron) : Protection against, up to 100 million Electron Volts (National Bureau of Standards, Handbook 55), 340
Radiations (Ionizing) : Chemical Action of—Excitation of Optical Levels by Particles of Relatively Low Energy (Dr. Joseph Weiss), 78
  Chemical Actions of, on Liquids (Société de Chimie Physique Discussion on), 998
  A Quantitative Biological Test Sensitive to Low Doses of (Dr. H. Marcovich), 796
Radicals : Free, in Biological Materials (Prof. Barry Commoner, Jonathan Townsend and George E. Pake), 689
Radicals (Free) : Stabilization of, by Adsorption—Detection by Paramagnetic Resonance (Dr. D. Bijl, Dr. H. Kainer and A. C. Rose-Innes), 830
Radicals in a Glass 'Cage' : Trapped Atoms and (Dr. Irwin Norman and Dr. George Porter), 508
Radin, Paul : The World of Primitive Man, review by Mrs. Sonia Cole, 623
Radio : Fields and Waves in Modern (Simon Ramo and Prof. John R. Whinnery), second edition, review by Dr. L. Jacob, 7
'Radio-Balance' for Determining the Thermal Energy of Radiation : Callendar's (W. B. Mann), 634
Radio Components Research and Development Committee : Colloquium on the Ferroelectric Properties of Single Crystals, 1091
Radio Echoes from Aurorae : Polarization of (A. G. McNamara and B. W. (Currie), 1153
Radio Emission from the Andromeda Nebula (J. E. Baldwin), 320
Radio Engineers, Institute of, and others : Fourth Annual Eastern Joint-Computer Conference and Exhibition (Design and Application of Small Digital Computers), 432, 681
Radio Industry Council : Awards for Technical Writing, 681
Radio Observations of Ionized Hydrogen Nebulae and other Discrete Sources at a Wave-length of 9·4 cm. (F. T. Haddock, C. H. Mayer and R. M. Sloanaker), 176
Radio Telescope at Jodrell Bank Experimental Station, University of Manchester, 68
Radio Telescopes : The Development and Use of Large (Prof. A. C. B. Lovell), 164
Radio Transmissions : World-wide Frequency and Time Comparisons by means of (J. A. Pierce, H. T. Mitchell and Dr. L. Essen), 922
Radioactive Frog Embryos : Electron-Track Autoradiography of (Frederick Sperling), 749
Radioactive Isotopes in Small-Mammal Ecology : Use of (Gillian K. Godfrey (Mrs. Crowcroft)), 951
Radioactive Materials : Techniques of Using and Handling (Courses at the Harwell Isotope School of the Atomic Energy Research Establishment), 1172
Radioactive Tobacco Mosaic Virus (F. L. Wynd), 297
Radioactive Tracers in Plant Nutrition (R. P. Martin and R. Scott Russell), 384
Radioactivities : Use of X-Ray Film for comparing (A. N. Davenport and G. W. W. Stevens), 178
Radiobiology : Physical and Chemical Aspects of Basic Mechanisms in (Proceedings of an Informal Conference held at Highland Park, Illinois, 1953, edited by John L. Magee, Martin D. Kamen and Robert L. Platzman), 389
Radiographs (Image Intensifier) : Visibility of X-Ray Quantum Fluctuations in (Dr. T. Tol and Dr. W. J. Oosterkamp), 397
Radiography : Memorandum on Gamma-Ray Sources for (Institute of Physics), second edition, 726
Radioisotope Conference at Oxford (Prof. J. Rotblat), 453 ; (J. E. Johnston), 453
Radiology, British Institute of : Exhibition of X-Ray Apparatus, 821
Radon Content of the Atmosphere (W. Anderson, Prof. W. V. Mayneord and R. C. Turner), 424
Radt, F. (edited by) : Elsevier's Encyclopaedia of Organic Chemistry, Series 3, Carboisocyclic Condensed Compounds, Vol. 12B, Naphthalene (A), Compounds containing One Naphthalene Nucleus, Naphthoic Acids and their Halogen, Nitrogen and Hydroxyl Derivatives, *review* by Dr. J. W. Cook, 1073
Rae, R. : Education and Extension Services in Applied Biology, 769
Raimes, Dr. S. : The Electronic Band Structure of Solids, 950
Ram in East Africa : Experiments on Artificial Stimulation of (D. A. Davies), 256
Rainey, Dr. R. C. : Application of Insecticides from Aircraft, 541
Raja Rama Rao, M. R., and De, Dr. N. N. : Abdominal Lymphatic Tissue as a Source of Hyperglycaemic Glycogenolytic Factor, 229
Rajagopalan, Dr. R., and others : Biological Value of Proteins as influenced by Dietary Vitamin B_{12}, 35
Raju, N. Appala, and Rao, Prof. G. Gopala : Fluorometric Detection and Estimation of Germanium, 400
Ram, Dr. Atma : Presidential Address at the Silver Jubilee celebrations of the Indian Ceramic Society, 538
Ramachandran, G. N., and Kartha, G. : Structure of Collagen, 269
Ramage, C. S. : Appointed assistant director, Royal Observatory, Hong Kong, 821
Ramakrishnan, C. V., and Martin, S. M. : Inhibition of the 'Condensing Enzyme' of *Aspergillus niger* by Magnesium, 230
Ramamurti, T. V., and others : Low-temperature Sintering of Titanium Dioxide for Ceramic Capacitors, 1187
Raman, Sir C. V. : Awarded the Bharat Ratna by the President of India on Independence Day, 428
Ramanathan, Dr. K. R. : Physical Research Laboratory, Ahmedabad, 1078
Ramiah, K., and Rao, M. B. V. N. : Rice Breeding and Genetics, 862
Ramirez, Rev. J. E. : Microseisms, 302
Ramm, Dr. C. A. : Resignation as lecturer in physics at the University of Birmingham, 820
Ramo, Simon, and Whinnery, Prof. John R. : Fields and Waves in Modern Radio, second edition, *review* by Dr. L. Jacob, 7
Ramsay Memorial Fellowship Awards for Research in Chemistry for 1954–55, 112
Ramsbottom, Dr. John : Mushrooms and Toadstools, a Study of the Activities of Fungi, *review* by Prof. Ronald Good, 197
Ramsey, Prof. N. F. : Nuclear and Meson Physics, 530
Rand, Austin L. : Social Feeding Behaviour of Birds, 301
Rand, Mogens (King, R. O., and) : The Hydrogen Engine, 975
Randall, Prof. J. T. : Observations on the Collagen System (Sixth Procter Memorial Lecture of the Society of Leather Trades' Chemists), 298, 853
Randall, Prof. J. T., and others : Structural Units in Collagen Fibrils, 1142
Randle, P. J. : Enhancement of Insulin Action by Pituitary Growth Hormone, 1053
Randle, R. R., and Whiffen, D. H. : Molecular Spectroscopy, 1166
Random Fragmentation (Dr. F. C. Auluck and Dr. D. S. Kothari), 565
Range of the Angwantibo : Extension of (D. R. Rosevear), 190
Rannu, Uttar Pradesh, India : Kornerupine from (Dr. M. V. N. Murthy), 1065
Rao, Dr. B. Ramachandra, and Rao, P. Venugopala : A Modified Wedge Method for exciting Shear Modes in Isotropic Media, 835
Rao, Prof. G. Gopala (Raju, N. Appala, and) : Fluorometric Detection and Estimation of Germanium, 400
Rao, M. B. V. N. (Ramiah, K., and) : Rice Breeding and Genetics, 862
Rao, P. Venugopala (Rao, Dr. B. Ramachandra, and) : A Modified Wedge Method for exciting Shear Modes in Isotropic Media, 835
Raper, Dr. R. (Mansford, K., and) : Amino-Acid Content of Plants, 314
Raphael, Dr. R. A. : Chemistry of Carbon Compounds, *review*, 669
Rare Gases : Non-isothermal Plasmas in the (R. D. Craig and Dr. J. D. Craggs), 367
Rarer Metal, Zirconium, *review* by H. W. Greenwood, 286
Rasmussen, E. : Atomic Line Spectra, 730
Rassweiler, Dr. Clifford F. : Physical Facilities for Research, 1044
Rat : Effect of Acetate on the Fasting Blood-Sugar Level of the (R. J. Garner and R. Roberts), 1194
  Effect of Ethylenediamine-tetra-acetic Acid on the Excretion of Zinc by the (M. J. Millar, M. I. Fischer, C. A. Mawson and P. V. Elcoate), 881
Rat (Adult) : Metabolism of Elastin in the (H. G. B. Slack), 512
Rat (Neonatal) : Effect of Cortisone on the (Dr. E. J. Field), 182
Rat (White) : Cell Activity and Deoxyribonucleic Acid Content of the Nuclei of the Thyroid Gland of the (H. Roels), 514
Rat as a Test Animal in evaluating Artificial Human Milk for Infants (Prof. Paavo Roine, Helge Gyllenberg, Marjatta Rossander and Ritva Vuokila), 519
Rat Adrenal : Secretion of Aldosterone and Corticosterone by the (Bertha Singer and M. P. Stack-Dunne), 790
Rat Liver : Conversion of Schradan and Parathion by an Enzyme System of (A. N. Davison), 1056
Rat Liver after n-Butanol Treatment : An Improved Resolution of Cytoplasmic Proteins of (G. Adjutantis), 1054
Rat Lung-worm : Life-history of the, and its Migration through the Brain of its Host (Dr. M. Josephine Mackerras and Dorothea F. Sandars), *erratum*, 164
Rates (Absolute), of Chlorine Monoxide Reactions : Photolysis of Chlorine Dioxide and (F. J. Lipscomb, Prof. R. G. W. Norrish and Dr. G. Porter), 785
Ratio Estimators : Unbiased (Prof. H. O. Hartley and Dr. A. Ross), 270
Rationalism as a Creed, *review* by Prof. T. S. Simey, 1162
Rats and Mice : Control of (edited by Dennis Chitty and H. N. Southern), Vol. 1, Rats ; Vol. 2, Rats ; Vol. 3, House Mice, *review* by S. A. Barnett, 1118
Rats, Mice and Men, *review* by S. A. Barnett, 1118
Rau, Dr. W. : Physics of Clouds and Precipitation, 958
Rauscher, Prof. Manfred : Introduction to Aeronautical Dynamics, *review* by Prof. W. J. Duncan, 1073
Rauwolfia serpentina : Mechanism of Hypotensive Action of Reserpine, an Alkaloid of (Dr. E. G. McQueen, Dr. A. E. Doyle and Dr. F. H. Smirk), 1015
Raven, David J. (Earland, Christopher, and) : A New Solvent for Silk, 461
Ravera, O. : Biological, Physical and Chemical Characteristics of the Profundal Zone of Lakes, 1136
Raw, J. J. : Appointed agricultural officer, Nigeria, 821
Raw Material in Food Production, *review* by Dr. A. M. Smith, 809
Rawlings, G. B. : Insects and the Diseases of Conifers in New Zealand, 1087
Rawlins, F. I. G. : Bertrand Russell's Theories of Causation, *review*, 54
  The Cambridge Platonists, *review*, 475
  Nature, Mind and Modern Science, *review*, 480
  The Cleavage in European Science, *review*, 666
Ray, Prof. P. : Annual Report on the Indian Association for the Cultivation of Science, 495
Raymond, W. F., and others : Nutritive Value of Lucerne Protein Concentrates, fed with and without Cholesterol, 227
Rayns, Frank : Appointed a member of the Agricultural Research Council, 777
Rayon Research Association, British : Appointment of Dr. George Porter as assistant director in charge of fundamental research, 1040
Rea, J. H. : Aircraft Electrical Systems, 1001
Reaction (Sensory-Motor) : Antagonist Inhibition as the Earliest Sign of a (H.-J. Hufschmidt and Tamara Hufschmidt), 607
Reaction for Deoxyribose Compounds : Colour (Dr. Lionel A. Manson), 967
Reaction between Phthalein Dyes and Heated Foodstuffs (Allan Frolich), 879
Reaction of Stearic Acid Monolayers with Copper and Cuprous Oxide (Alan Dobry and Henry E. Mahncke), 507 ; (Dr. D. Tabor), 507
'Reaction Time' of Cast Trinitrotoluene as a Function of the Rate of Charge Cooling (W. M. Evans and T. C. Tranter), 1100
Reactions (Chlorine Monoxide) : Photolysis of Chlorine Dioxide and Absolute Rates of (F. J. Lipscomb, Prof. R. G. W. Norrish and Dr. G. Porter), 785

Reactions (Hæmoprotein) : Effect of Hæm-linked and other Ionizations on (Dr. Philip George and Dr. G. I. H. Hanania), 33
Reactions occurring during Dinitrophenylation of α-, β- and ω-Amino-acids with Sanger's Reagent : Polymerization (D. Heikens, Dr. P. H. Hermans and P. F. van Velden), 1187
Reactions in Freeze-dried Extractives from the Skeletal Muscle of Codling (*Gadus callarias*) : 'Browning' (Dr. N. R. Jones), 605
Reactions of Higher Order : Methods of Calculation of Polarographic Currents for Depolarization Schemes involving (Dr. Jaroslav Koutecky), 233
Reactions of Kenya Cattle vaccinated with Lapinized Rinderpest Virus : Thermal (G. R. Scott), 44
Reactions of Molten Salts with Layer-Lattice Silicates (Joe L. White), 799
Reactor : Heavy-Water, (Dimple) at Harwell (United Kingdom Atomic Energy Authority), 251
Reactor School at Harwell : Opening of a (Atomic Energy Research Establishment), 635
Read, Prof. John : Synthetic Organic Chemistry, *review*, 576
  Organic Syntheses, *review*, 900
Reagent (Sanger's) : Polymerization Reactions occurring during Dinitrophenylation of α-, β- and ω-Amino-acids with (D. Heikens, Dr. P. H. Hermans and P. F. van Velden), 1187
Reagent for Paper Chromatography of Polyols and Cetoses : A New Spray (Dr. Paul Godin), 134
Reagent of Wide Use in Organic and Histochemical Analysis : Salicyloylhydrazide, a (Dr. B. Camber), 1107
Reagents and Techniques : New (Prof. Wesley Cocker), 591
Reals, Dr. W. H. : Social and Individual Significance of Ageing, 684
Rearing Individual Trombiculid Mites in the Field : A Method of (Dr. J. R. Audy and M. Nadchatram), 1021
Rebellion in South-East Africa : Rituals of (Prof. Max Gluckman), 72
Recession of the Galaxies in Eddington's Theory (Dr. N. B. Slater), 321
Recording of Cathode Ray Tube Traces : Photographic (F. B. Cope), 137
Recruitment in the Engineering Industry in Britain (British Association for the Advancement of Science, Sections G (Engineering) and L (Education), Discussion on), 637
Red Blood Cells of British Breeds of Sheep : Electrolyte Concentrations in (John V. Evans), 931
Red Cell Membrane : Passage of Glucose and Glycerol across the (Freda Bowyer), 355
Red-Cell Stroma (Human) : Electrophoresis of (T. A. J. Prankerd, Dr. K. I. Altman and J. R. Anderson), 1146
Red Indian Life in the 1830's : Exhibition at the Whitechapel Art Gallery, London, of a selection of the paintings by George Catlin, of, 207
Red Melanin in the Silkworm : Mechanism of the Formation of (Kaoru Inagami), 1105
Red Shifts : The Law of, and the Distances of Nebulæ (the late Dr. Edwin Hubble), 1046
Redman, Prof. R. O. : Total Solar Eclipse of June 30—British Expeditions' Results, 247
Reed, G. B., and others : Synthesis of Sucrose by Tobacco Leaves, 1038
Refractive Index of Cytoplasmic Inclusions in Living Cells : Measurement of the, by the Interference Microscope (K. F. A. Ross), 836
Refractometer : A Modified Differential (Dr. F. Korosy), 269
Refrigeration, International Institute of : Proceedings of the Meetings of Commissions 1 and 2 at Zurich, 297
Registration of Chemists and Engineers in the United States, 65
Regulation in British Dragonflies : Seasonal (Philip S. Corbet), 655, *erratum*, 777
Reichenberg, D., and Sutcliffe, J. F. : Absorption of Ions by Plants, 1047
Reinouts van Haga, Dr. P. : Cuscohygrine, a Normal Constituent Alkaloid of *Atropa belladonna*, 833
Reintjes, Prof. J. Francis, and Coate, Godfrey T. : Principles of Radar (members of the Staff of the Radar School, Massachusetts Institute of Technology), third edition, *review*, 7
Reiss, Dr. M. : Chemistry in relation to the Development of the Nervous System, 457
Reith, Lord : Into the Wind, 759
Relation between Vitamin D and Vitamin B_{12} (Allan Frolich), 462
Relational Balance of *X*-Chromosomes in *Drosophila melanogaster* : Stability in Development and (G. Tebb and Dr. J. M. Thoday), 1109
Relationship of Palæontology to Stratigraphy (Dr. C. J. Stubblefield), 439
Relaxation of Collagen Fibres : Contraction and (Dr. I. Banga, Prof. J. Baló and D. Szabó), 788
Relaxation in Physics and Engineering, *review* by Prof. G. Temple, 714
Relaxation Methods (D. N. de G. Allen), *review* by Prof. G. Temple, 714
  An Introduction to (F. S. Shaw), *review* by Prof. G. Temple, 714
Release of Adrenocorticotrophic Hormone : Effect of Posterior Pituitary Hormone on the (Shinji Itoh and Akira Arimura), 37
Relf, Ernest F. : Original Papers of Wilbur and Orville Wright, *review*, 195
Relief of Pain (Prof. A. D. Macdonald), 442 ; (British Association for the Advancement of Science, Section I (Physiology), Discussion on), 629
Removal of Apical Sections of the Stem : Acceleration of Flowering in Non-vernalized Chrysanthemums by the (Dr. D. Vince and D. T. Mason), 842 ; (Dr. W. W. Schwabe), 1022
Renaissance in England : The Platonic (Prof. Ernst Cassirer), translated by James P. Pettegrove, *review* by F. I. G. Rawlins, 475
Renal Excretion of 17-Ketosteroids by Members of some Ethnic Groups living in Malaya (Prof. J. W. H. Lugg and Dr. J. M. Bowness), 1147
Reproduction and Sex (Dr. G. I. M. Swyer), *review* by Dr. Clifford Allen, 763
Reproduction and Young Stages of Loch Trout (*Salmo trutta* L.) : Spawning Migration, (T. A. Stuart), 342
Research : The Administration of (Eighth Annual Conference on), 1043
  Agricultural, under Review, 663, 955
  Application of Results of (compiled and edited by Vera Connell, in collaboration with the British Commonwealth Scientific Offices, London), 805
  Applied, in Technical Colleges (London and Home Counties Regional Advisory Council for Higher Technological Education, Publication No. 18), 913
  Chemical (Meeting of the Scientific Film Association for the introduction and exhibition of films of advances in), 492
  The Microscope in Industry and (W. Watson and Sons, Ltd., Exhibition on), 386
  Odour (New York Academy of Sciences and the American Society of Heating and Ventilating Engineers Conference on), 303
  Scientific, of Mellon Institute (1953–1954), 496
  Scientific ; and Industrial Productivity (Sondes Place Research Institute, Occasional Bulletin No. 7), 1130
  Utilization of, in the British Commonwealth, 805
Research (Agricultural) : Fundamental Science in, with special reference to the Development of Genetics (Prof. K. Mather), 998
Research (Applied) : Organization of, in Europe (Organization for European Economic Co-operation), 778
Research (Arid Zone) : Seventh Session of the Advisory Committee on (Unesco), 115
Research (Biological) : The Application of, to Canadian Agriculture and Forestry (Dr. K. W. Neatby), 766
Research (Cancer) : Progress of, 289
Research (Fundamental) : The Contribution of, to Applied Biology (Prof. V. B. Wigglesworth), 766
Research (Genetical) : Current Trends of, in Hungary (Anne McLaren and Donald Michie), 390
Research (High-Temperature) : Solar Furnaces for (W. M. Conn), 490
Research (Nuclear Energy), Dutch–Norwegian Joint Establishment for : Report for the Year 1952–53, 258
Research (Rubber) : New Technical Bulletins on (British Rubber Producers Research Association), 296
Research (Scientific) : Basic, and Public Policy in the United States, 70
  The Influence of, in the Modern World (Symposium at the Research Laboratory in Geneva of the Battelle Memorial Institute), 910
  Register of Current ; at South African Universities (Council of Scientific and Industrial Research, Pretoria), 429
Research in British Power Industries : Gas and Electricity, 996 ; Nuclear Power, 996
Research in Chemistry : Grants for (Chemical Society), 209
  Ramsay Memorial Fellowship Awards for 1954–55, 112
Research in Dairying, National Institute for : Annual Report for 1953, 208
Research on Electromagnetic Radiation : T. K. Sidey Summer-time Award for (Royal Society of New Zealand), 955
Research in Finland : Experimental Chemical Carcinogenesis and the Influence of Solvents— (Prof. Kai Setälä), 873
Research on Humane Vivisection, 488
Research on Macromolecules, Centre for (Strasbourg), 1126
Research on the Mammals of Africa (Dr. L. Harrison Matthews), 670
Research on the Mammals of South Africa (J. Meester), 1149
Research in Mexico : Veterinary, by the University of Pennsylvania, 954
Research for National Defence : Financial Control of, 95
Research in Nutrition : Drummond Fellowship for, 955
Research on Odour : Basic (H. Sosnowick), 303
Research on Problems of Utilization of Saline Water : Reviews of (Unesco Arid Zone Programme), 782
Research in Rheumatism : Support for (Nuffield Foundation), 909
Research in Tissue Culture, 1884 to 1950 : A Bibliography of the (prepared by Margaret R. Murray and Gertrude Kopech), *review*, 576
Research Associations, Committee of Directors of : Election of Dr. S. Whitehead as chairman, 20
Research Council of Alberta : Thirty-fourth Annual Report (1953), 917
Research Council of Israel, and others : Scientific Convocation in celebration of the seventy-fifth birthday of Prof. Albert Einstein, 591
Research Expenditure (Committee of Public Accounts), 537
Research Fellowship in Aeronautics : English Electric (awarded to M. E. Filby), 680
Research Fellowship in the field of Organic Chemistry, (sponsored by the Geigy Company for one year in the University of Birmingham), 1132
Research Fellowships : Locke (Royal Society Awards), 1174
Research Fellowships for British Scientists : United States, 164, 1173
Research Medal of the Royal Agricultural Society of England, 910
Research Scholarships : Postgraduate (Courtaulds' Scientific and Educational Trust Fund, Awards for 1954), 492
Research Services : Insecticide and Fungicide, in Great Britain, 111
Research Studentships in Chemistry (British Celanese, Ltd., Awards), 681
Research Studentships in Ecology (Nature Conservancy Awards), 727
Research and Development : Industrial, in the United States, 26
  Scientific, in American Industry (Bulletin No. 1148 of the Bureau of Labor Statistics, United States Department of Labor), 26
Research and Development in Aluminium—Banbury Laboratories of Aluminium Laboratories, Ltd., 254
Reserpine, an Alkaloid of *Rauwolfia serpentina* : Mechanism of Hypotensive Action of (Dr. E. G. McQueen, Dr. A. E. Doyle and Dr. F. H. Smirk), 1015
Resistance to Flow of Liquids over Solids by Thin Films extending from the Edge of Pools or from Menisci (E. B. Bielak, G. F. N. Calderwood and Dr. E. W. J. Mardles), 1009
Resolution of Cytoplasmic Proteins of Rat Liver after *n*-Butanol Treatment : An Improved (G. Adjutantis), 1054
Resonance : Paramagnetic—a New Property of Coal-like Materials (J. Uebersfeld, A. Étienne and J. Combrisson), 614
Resonance (Paramagnetic) : Stabilization of Free Radicals by Adsorption—Detection by (Dr. D. Bijl, Dr. H. Kainer and A. C. Rose-Innes), 830
Resonance in Carbonaceous Solids : Paramagnetic (Dr. D. J. E. Ingram, J. G. Tapley, Dr. R. Jackson, R. L. Bond and A. R. Murnaghan), 797
Resonance in Ferrites : Ferromagnetic (P. A. Miles), 177
Resources : World Population and, I ; (Prof. E. P. Stebbing), 678
Respiration : Plant (Dr. W. O. James), *review* by Prof. W. Stiles, 328
Respiration (Brain) : Narcotics and (Dr. J. J. Ghosh and Prof. J. H. Quastel), 28
Respiration in Plants, *review* by Prof. W. Stiles, 328
Respiratory Activity of Cell-free Extracts of *Aerobacter aerogenes* : Role of High-molecular Weight Components in the (Dr. A. Tissières), 183
Respiratory-rate in Sweet Potato Tissue infected with Black-Rot : Increase of (Dr. Ikuzo Uritani, Takashi Akazawa and Miyoko Uritani), 1060
Respiratory Tract of Chickens : Isolation from the Lower, of Bacteria administered by Mouth (H. Williams Smith), 45
Responsibility : Knowledge and, 237
Rest Period of the Potato Tuber : Growth- and Inhibiting-Substances in relation to the (K. L. J. Blommaert), 970

Restriction of Inflammatory Response by Polysaccharides (M. Shilo, B. Wolman and Shlomo Hestrin), 786
Results of Research: The Application of (compiled and edited by Vera Connell, in collaboration with the British Commonwealth Scientific Offices, London), 805
Reticulin: A Lipid Component of (Dr. K. Little and G. M. Windrum), 789
Revelle, Roger (Fisher, Robert L., and): A Deep Sounding from the Southern Hemisphere, 469
Reversal and Mechanism of Oxidative Phosphorylation (Prof. P. D. Boyer, A. B. Falcone and W. H. Harrison), 401
Revolution in Physics (Louis de Broglie), *review* by Prof. W. H. McCrea, 762
Reynolds, P., and others: Determination of the Absolute Concentration of Deuterium in Thames River Water, 469
Reynolds, T. M. (Anet, E. F. L. J., and): Isolation of Mucic Acid from Fruits, 930
Reynolds, T. M. (Ash, A. S. F., and): Ketose Oligosaccharides in the Apricot Fruit, 602
Rh Blood Group, *review* by Dr. F. Stratton, 1029
Rh Blood-Group Genes: A Position Effect of the (Dr. R. R. Race, Dr. Ruth Sanger, Dr. P. Levine, R. T. McGee, Dr. J. J. van Loghem, Miss Mia van der Hart and C. Cameron), 460
Rh–Hr Blood Types (Prof. Alexander S. Wiener), *review* by Dr. F. Stratton, 1029
Rh–Hr Syllabus (Prof. Alexander S. Wiener), *review* by Dr. F. Stratton, 1029
Rhamnose: Sweetness and Configuration in (Prof. Yojiro Tsuzuki and Nobuo Mori), 458
Rheology, British Society of: Conference on Rheology in Mechanical Engineering, 201
Rheology in Mechanical Engineering (British Society of Rheology Conference on), 201
Rheology and Settlement of Pigmented Systems (Oil and Colour Chemists' Association Symposium on), 344
Rheumatism: Support for Research in (Nuffield Foundation), 909
Rhoderick, Dr. E. H., and others: Measurements of Lifetimes of Excited States of Atoms by the Method of Delayed Coincidences, 564
Rhodes, —: Ferroelectric Properties of Single Crystals, 1092
Rhodesia (Southern): Tobacco Research Board of—New Headquarters Station at Kutsaga (Dr. F. A. Stinson), 25
Rhodopsin in the Living Human Eye: Measurement of (Dr. W. A. H. Rushton and Dr. F. W. Campbell), 1096
Riboflavin-producing Bacterium (Subrata Ganguly), 559
Ribonuclease: Effects of, on the Metabolism of Living Root-Tip Cells (Prof. J. Brachet), 876
  Influence of, on the Division of Amphibian Eggs (L. Ledoux, J. Le Clerc and F. Vanderhaeghe), 793
Ribonucleases (Intracellular): A Possible Function of (Jay S. Roth), 129
Ribonucleotide Analysis of Individual Nerve Cells (Jan-Erik Edström and Holger Hydén), 128
Rice Breeding and Genetics (K. Ramiah and M. B. V. N. Rao), 862
Rice Substitutes (V. Subrahmanyan, D. S. Bhatia, M. Swaminathan and G. S. Bains), 199
Richards, D. L., and others: Velocity of Electron Pulses, 398, 681
Richards, Dr. O. W.: The Social Insects, *review* by Dr. C. G. Butler, 622
Richards, R. E.: Molecular Spectroscopy, 1167
Richardson, A.: Appointed lecturer in the Department of Electrical Engineering, University of Leeds, 863
Richardson, Dr. Eileen N.: Awarded a Mr. and Mrs. John Jaffe Donation Studentship by the Royal Society, 164
Richardson, Howard L.: Management in the Research Laboratory, 1043
Richardson, Dr. I. M.: Social and Individual Significance of Ageing, 683
Richardson, K. C., and Folley, Dr. S. J.: Synthetic Activity of a Single Epithelial Cell of the Lactating Goat Udder, 828
Richey, Dr. J. E.: Coalfields of Great Britain, *review*, 418
Richmond, Prof. I. A.: *Obituary* of J. P. Bushe-Fox, 860
  Obituary of B. H. St. J. O'Neil, 995
Richmond, Jonas E., and others: Biosynthesis of Haemin in Soy-bean Nodule Homogenates, 34
Richter, Dr. D.: Chemistry in relation to the Development of the Nervous System, 456
Richtmyer Memorial Lecture of the American Physical Society (Prof. J. A. Wheeler), 914
Rideal, Sir Eric: Debye's Collected Papers, *review*, 4
Rideal, Sir Eric (Baker, M. McD., and): Chemisorption of Metals, 1185
Riderless Microchemical Balances (Dr. T. S. West), 731
Ridgway, J. D.: Bacteriology of Milk and Milk Products, 1135
Riepma, Dr. P.: Weed Control, 1178
Rift Valley Fever Virus: Destruction of Tumour Cells by (Dr. N. Takemori, M. Nakano, M. Hemmi, H. Ikeda, S. Yamagida and M. Kitaoka), 698
Right to Dissent, *review* by R. Brightman, 942
Rigler, Dr. R. (Holzbauer, Dr. Marg., and): Inactivation of the Chromatophore-expanding Activity of Pituitary Extracts by Ascorbic Acid, 877
Riley, F. T.: Distillation, 591
Riley, Dr. J. F. (West, Dr. G. B., and): Chromatography of Tissue Histamine, 882
Riley, Dr. J. F., and others: Heparin and Histamine in Mast-Cell Tumours from Dogs, 318
Riley, Dr. J. P. (Mullin, J. B., and): Cadmium in Sea-water, 42
Rinaldo, John B., and others: Cave Sites of the Mogollon Culture in New Mexico, 997
Rinderpest Virus (Lapinized): Thermal Reactions of Kenya Cattle vaccinated with (G. R. Scott), 44
Ripley, G. W. (Preston, Prof. R. D., and): Electron Diffraction Diagrams of Cellulose Microfibrils in *Valonia*, 76
Ripper, Dr. W. E.: Crop Protection, 769
Risberg, P.: Atomic Line Spectra, 731
Rishbeth, Dr. J.: The Wet-film Indian Ink Method for examining Micro-organisms, 361
  Soil-borne Pests and Diseases, 768
Ritchie, Prof. James: Elected president of the Royal Society of Edinburgh, 864
Rituals of Rebellion in South-East Africa (Prof. Max Gluckman), 72
River Purification (F. T. K. Pentelow), *review* by B. A. S., 152
River Water (Thames): Determination of the Absolute Concentration of Deuterium in (G. Clarke, W. H. Denton and P. Reynolds), 469
Rivett, Sir David: Awarded the James Cook Medal for 1953 of the Royal Society of New South Wales, 428; work of, 428
Road Safety: The Vehicle and (British Association for the Advancement of Science, Section G (Engineering), Discussion on), 630
Robbins, B. G.: The Vehicle and Road Safety, 632
Robbins, Prof. Frederick C.: Nobel Prize for Physiology and Medicine for 1954 awarded jointly to Prof. John F. Enders, Prof. Thomas H. Weller and, 818
Robbins, R. G. (Asprey, G. F., and): The Vegetation of Jamaica, 66
Roberts, Dr. A.: Appointed senior lecturer in the Postgraduate School of Mining, University of Sheffield, 820
Roberts, Dr. E. R., and Wilson, Dr. T. G. G.: Nitrogen Fixation by Soil Yeasts, 842
Roberts, Dr. E. R. (Wilson, Dr. T. G. G., and): Attempts at Nitrogen Fixation *in vitro*, 795
Roberts, H. A.: Weed Control, 1178
Roberts, J.: Social and Individual Significance of Ageing, 684
Roberts, R. (Garner, R. J., and): Effect of Acetate on the Fasting Blood-Sugar Level of the Rat, 1194
Robertson, Dr. A.: Genetics in relation to other Biological Sciences, 672
Robertson, Dr. J. H.: Appointed Brotherton lecturer in the Department of Inorganic and Structural Chemistry, University of Leeds, 863
Robertson, Dr. J. H., and others: Structure of Vitamin B_{12}—X-Ray Crystallographic Evidence on the Structure of Vitamin B_{12}, 1169
Robertson, W. G. P., and others: Synthesis of Branched Polymers, 78
Robinson, Dr. A.: Ferroelectric Properties of Single Crystals, 1093
Robinson, Dr. D. S.: Awarded the Alan Johnston Lawrence and Moseley Research Fellowship of the Royal Society, 18
Robinson, Prof. E. A. G.: The Changing Structure of the British Economy, 440
  Appointed a member of the Advisory Council for Scientific and Industrial Research, 540
Robinson, F. A., and others: Vitamin B_{12} in Crude Liver Extracts, 558
Robinson, Dr. F. N. H.: Low-Temperature Physics, 770
Robinson, Prof. H. R.: Elected vice-chancellor of the University of London, 20
Robinson, Prof. H. R., and others: Rutherford by Those who Knew Him, 161
Robinson, J. T.: The Australopithecine Occiput, 262
  Nuchal Crests in Australopithecines, 1197
Robinson, Sir Robert: Elected president of the British Association for the Advancement of Science, 488; work of, 488
  Complex Natural Colouring Matters, 990
Robinson, T. S.: Molecular Spectroscopy, 1166
Robinson, W. J.: Rheology in Mechanical Engineering, 202
Robson, A., and others: Basic Amino-acids of Silk Fibroin, 603
Robson, Stanley: Chemical Engineering in Great Britain, 819
Robson, Prof. W. A.: The British Civil Service, 986
Rochester, Dr. G. D.: Meson Physics, *review*, 97
Rochford, D. J.: A Chainomatic Pycnometer for the Determination of Chlorine in Sea Water, 641
Rock-paintings in New South Wales: Aboriginal (W. H. Kinsela), 343
Rockefeller Foundation: Grant of 7,500 dollars to the University of Glasgow towards the expenses of three Conferences of European Scientists interested in Genetical Problems, 777
  Grant of 15,000 dollars to the Department of Chemistry, University of Birmingham, for Prof. M. Stacey's research in biochemistry, 1132
  Grants made during the third quarter of 1954, 1133
Rocks: Distribution of Minor Elements in (British Association for the Advancement of Science, Section C (Geology), Discussion on), 811
  Frequency Distribution of the Concentrations of Elements in (K. V. Aubrey), 141
Rodd, Dr. E. H. (edited by): Chemistry of Carbon Compounds, Vol. 2, Part B, Alicyclic Compounds, *review* by Dr. R. A. Raphael, 669
Rodig, Dr. O. R.: Awarded a Ramsay Memorial Fellowship for 1954–55 for research in chemistry, 112
Roebuck, D. S. P., and others: Magnetic Susceptibility of Vanadium Dioxide, 754
Roels, H.: Cell Activity and Deoxyribonucleic Acid Content of the Nuclei of the Thyroid Gland of the White Rat, 514
Rogers, Dr. C. A.: Appointed to the Mason chair of pure mathematics in the University of Birmingham, 820, 953; work of, 953
Rogers, Dr. D.: Determination of Crystal Structures, *review*, 943
Roine, Prof. Paavo, and others: The Rat as a Test Animal in evaluating Artificial Human Milk for Infants, 519
Rollins, Dr. R. C.: Plant Genera, 71
Romanes, Giles L. (presented by): Alethotropic Logic, a Posthumous Work (Sir Almroth E. Wright), *review* by Prof. L. P. Garrod, 621
Romano-British Times: The Marshes of the Medway Estuary in (Surg.-Comdr. H. M. Darlow and Surg.-Comdr. P. H. K. Gray), 90; (I. Noël Hume), 91
Romell, Prof. L. G.: The Interactions between Acid Soils and Forest Trees, 855
Romig, Harry G.: 50–100 Binomial Tables, *review*, 668
Ronan, C. A.: William Herschel, his Work and Personality, *review*, 329
Root Culture and Biochemical Genetics (W. G. Boll), 820
Root Sterilization: A Centrifuging Method for (John C. Hopkins), 1016
Root-Tip Cells (Living): Effects of Ribonuclease on the Metabolism of (Prof. J. Brachet), 876
Rootes, Sir Reginald: Research in the Motor Industry, 547
Roots (Excised Tomato): Norvaline, a Growth Factor for (William G. Boll), 517
Roots (Growing): A New Approach to the Study of Electric Fields produced by (Prof. A. L. McAulay and B. I. H. Scott), 924
Roots (Plant): Liberation of Amino acids by, in relation to Desiccation (H. Katznelson, J. W. Rouatt and T. M. B. Payne), 1110
Roozeboom, H. W. B. (1854–1907), 775
Roper, Dr. J. A.: Genetics in relation to other Biological Sciences, 673
Roque, Dr. A. L.: The Golgi Apparatus, 22
Rose, A. H. (Challinor, Dr. S. W., and): Interrelationships between a Yeast and a Bacterium when Growing Together in Defined Medium, 877

Rose, F. A., and others : Isolation and Characterization of Biosynthetic Arylsulphates, 599
Rose, Dr. H. E : Course on the Measurement of the Particle-size Characteristics of Fine Particles, to be given in the Faculty of Engineering, King's College, London, 298
Rose-Innes, A. C., and others : Stabilization of Free Radicals by Adsorption—Detection by Paramagnetic Resonance, 830
Rosenfeld, Prof. L. : Marie Curie Celebrations in Warsaw, 959
  The Sinews of Science, review, 4
Rosevear, D. R. : Extension of Range of the Angwantibo, 190
Ross, Dr. A. (Hartley, Prof. H. O., and) : Unbiased Ratio Estimators, 270
Ross, I. : Ferroelectric Properties of Single Crystals, 1093
Ross, J. M. : Appointed veterinary officer, Northern Rhodesia, 209
Ross, K. F. A. : Measurement of the Refractive Index of Cytoplasmic Inclusions in Living Cells by the Interference Microscope, 836
Ross, Dr. N. S. : Appointed Harry Payne lecturer in employer–employee relations at the University of Birmingham, 1132
Rossander, Marjatta, and others : The Rat as a Test Animal in evaluating Artificial Human Milk for Infants, 519
Rossby, Prof. C. G. : Weather Forecasting, 675
  Physics of Clouds and Precipitation, 958
Rossini, Prof. Frederick D., and others : Selected Values of Physical and Thermodynamic Properties of Hydrocarbons and related Compounds—Comprising the Tables of the American Petroleum Institute Project 44, *review* by H. B. Milner, 54
Rotating Liquid Masses : The Stability of (Dr. R. A. Lyttleton), *review* by Prof. W. H. McCrea, 621
Rotblat, Prof. J. : Radioisotope Conference at Oxford, 453
Rotgrunblindheit als Erlebnis—Fuhrer durch die Farbwelt fur Rotgrunblinde (Dr. Heinz Ahlenstiel), *review* by Prof. W. D. Wright, 989
Roth, Jay S. : A Possible Function of Intracellular Ribonucleases, 129
Rothamsted Experimental Station : Report for 1953, 498, *erratum*, 727
Rouatt, J. W., and others : Liberation of Amino-acids by Plant Roots in relation to Desiccation, 1110
Rout, Dr. M. K., and others : Use of Mercurated Thiazoles as Fungistatic Agents, 516
Roux, Marie, and others : Staining Reactions of Elastic Fibres with special reference to 'Elastotic Degenerations' in the Human Skin, 789
Rowe, N. E. : Selected as president-elect of the Royal Aeronautical Society, 818 : work of, 818
Rowson, L. E., and others : Successful Interbreed Transfer of Ova in Sheep, 890
Roy, A., and Bishop, Dr. Marcus W. H. : Effect of Glycine on the Survival of Bull Spermatozoa *in vitro*, 746
Roy, S. C., and others : Biosynthesis of *l*-Ascorbic Acid, 511
Royal Aeronautical Society : Selection of N. E. Rowe as president-elect, 818
Royal Agricultural Society of England : Offer of a medal and an award, 910
Royal Astronomical Society : New General Catalogue of Nebulæ and Clusters of Stars (1888), Index Catalogue (1895), Second Index Catalogue (1908), 635
  George Darwin Lecture (the late Dr. Edwin Hubble), 1046
Royal Botanic Gardens, Kew : Work during 1953, 429
Royal College of Surgeons of England 1930–1951 ; Lives of the Fellows of the (the late Sir D'Arcy Power, continued by W. R. Le Fanu), *review* by Sir Gordon Gordon-Taylor, 51
Royal Commission on the Civil Service : Evidence submitted by the Institution of Professional Civil Servants, 387
Royal Greenwich Observatory : Annual Report for 1953–54, 494
Royal Institute of Chemistry (Manchester and District Section): Exhibition of Chemical Laboratory Apparatus, Instruments and Techniques, 1174
Royal Institution : The Library of the, 1799–1954 (K. D. C. Vernon), 242
  Christmas Lectures for Young Persons (Sir Frank Whittle), 1040
Royal Medals for 1954 of the Royal Society awarded to Sir John Cockcroft and Prof. H. A. Krebs, 953, 1030
Royal Meteorological Society : Election of Officers, 67
  Symposium on the Upper Atmosphere, 334, *erratum*, 492
  Symposium on Meteorology and Scottish Agriculture, 493
Royal Meteorological Society in conjunction with the Council for the Promotion of Field Studies : Vacation Course in Synoptic Meteorology, 633
Royal Microscopical Society : Symposium on the Golgi Apparatus, 21, 727
  Proceedings of the International Conference on Electron Microscopy, London 1954, 826
Royal Military College of Science, Shrivenham : Appointment of Prof. S. J. Davies as dean, 727
Royal Naval Scientific Service : Appointment of Dr. H. F. Willis as chief, 1038
Royal Netherlands Meteorological Institute, 1854–1954 (Prof. W. Bleeker), 203
Royal Observatory, Hong Kong : Appointment of C. S. Ramage as assistant director, 821
Royal Photographic Society (Kinematograph Group) : Exhibition of Kinematography, 681
Royal Photographic Society (Scientific and Technical Group) : Autumn Conference (The Scientific and Technical Applications of Photography), 432
Royal Scottish Geographical Society : Election of Dr. D. A. Allan as president, 821
Royal Scottish Museum, Edinburgh (1854–1954), (Dr. F. S. Wallis), 332
Royal Scottish Museum (British Museum (Natural History), and the) : Training in Taxidermy, 66
Royal Society of Arts : R. B. Bennett Empire Prize for 1954 awarded to Dr. C. J. Mackenzie, 298
Royal Society of Edinburgh : Election of Officers, 864
  First Alembic Club Lecture (Prof. James Kendall), 864
Royal Society of London : Research Appointments, 18
  Award of Mr. and Mrs. John Jaffe Donation Studentships, 164
  Appointment of Prof. M. L. E. Oliphant as Rutherford Memorial Lecturer for 1955, 727
  Medal Awards for 1954, 908, 1030
  Award of Royal Medals, 953, 1030
  The Diversity of Scientific Advances (Anniversary Address by Dr. E. D. Adrian), 1032
  The Copley Medal and its Founder (Eng.-Capt. Edgar C. Smith), 1034
  Mathematical Tables, Vol. 3, Table of Binomial Coefficients (prepared for the Mathematical Tables Committees of the British Association and the Royal Society under the editorship of J. C. P. Miller), *review* by J. H. Pearce, 1075
  Election of Officers for 1955, 1174
  Award of Locke Research Fellowships, 1174
Royal Society and Nuffield Foundation Commonwealth Bursaries Scheme : Awards, 18, 1086
  Award made to Dr. S. Y. Thompson to visit the Dairy Research Institute, Palmerston North, 164
Royal Society of New South Wales : James Cook Medal for 1953 awarded to Sir David Rivett, 428
Royal Society of New Zealand : Bulletin No. 4, Science in New Zealand (H.R.H. the Duke of Edinburgh), 678
  T. K. Sidey Summer-time Award for Research on Electromagnetic Radiation, 955
Royal Technical College, Glasgow : Report on research for the Session 1952–53, 492
Royal Veterinary College : Appointment of Prof. R. E. Glover as principal and dean, 1132
Rubber Industry, Institution of the : Annual Report on the Progress of Rubber Technology, *review* by Dr. L. R. G. Treloar, 54
  Third International Rubber Technology Conference, 168
Rubber Manufacturers (British), Research Association of : New laboratories at Shawbury to be opened by H.R.H. the Duke of Edinburgh, 910
Rubber Producers Research Association, British : Technical Bulletin No. 1, Heveaplus M, 296
Rubber Research : New Technical Bulletins on (British Rubber Producers Research Association), 296
Rubber Technology : Annual Report on the Progress of (Institution of the Rubber Industry, Vol. 17), *review* by Dr. L. R. G. Treloar, 54
Rubber Technology Conference : Third International (F. A. Jones), 168
Rubbers, Plastics and Fibers : Fundamental Principles of Polymerization—(Dr. G. F. D'Alelio), *review* by Prof. H. W. Melville, 52
Rubio Huertos, Dr. Miguel : Rapid Extraction of Intact Crystalline Inclusions from the Cells of Plants infected with Tobacco Mosaic Virus, 313
Ruck, H. C., and Bolas, B. D. : Manganese and Metabolism in Potatoes, 726
Rudge, A. J., and others : Toxicity and Narcotic Activity of Fluorocarbons, 885
Rumen Ciliate Protozoa : A Remarkable Disintegrative Effect of Skatole upon certain (J. Margaret Eadie and Dr. A. E. Oxford), 973
Rumford Bicentenary—Celebrations in Boston, 861
Rumford Medal for 1954 of the Royal Society awarded to Dr. C. R. Burch, 908, 1030
Runner, Meredith N., and Gates, Allen : Conception in Prepuberal Mice following Artificially Induced Ovulation and Mating, 222
Rural England, Council for the Preservation of : Twenty-eighth Annual Report, 297
Rushton, Dr. W. A. H., and Campbell, Dr. F. W. : Measurement of Rhodopsin in the Living Human Eye, 1096
Russell, Dr. A. S., and others : Rutherford by Those who Knew Him, 161
Russell, Bertrand : Human Society in Ethics and Politics, *review* by Prof. T. S. Simey, 1162
Russell's (Bertrand) Theories of Causation (Erik Gotlind), *review* by F. I. G. Rawlins, 54
Russell, Dr. E. S. : *Obituary* by Michael Graham, 675
Russell, Frederick Stratten : The Medusae of the British Isles, *review* by Prof. T. A. Stephenson, 151
Russell, Sir John : Elected a foreign member of the Académie d'Agriculture de France, 20
  Thomas Jefferson, United States President and Farmer, *review*, 415
  The National Institute of Agricultural Botany—its Past, Present and Future, 446
  The Changing Problems of Applied Biology, 766
  World Population and World Food Supplies, *review* by Lord Boyd-Orr, 986
Russell, R. D., and others : Estimates of Age for some African Minerals, 1006
Russell, R. Scott (Martin, R. P., and) : Radioactive Tracers in Plant Nutrition, 384
Russell, Dr. W. M. S. : Appointed by the Universities Federation for Animal Welfare in association with the Animal Welfare Institute of New York as research fellow to study humane vivisection, 488
Rust Infection Studies (J. Bean, P. W. Brian and F. T. Brooks), 909
Rutgers University : Institute of Microbiology of, 105
Rutherford, A. A. : Awarded a scholarship in agricultural statistics by the Ministry of Agriculture of Northern Ireland, 821
Rutherford by Those who Knew Him (Prof. H. R. Robinson, Sir John Cockcroft, Prof. M. L. Oliphant, Dr. E. Marsden and Dr. A. S. Russell), 161
Rutherford Lecture of the Physical Society : Seventh (Prof. P. M. S. Blackett), 164
Ruttner, F. : Biological, Physical and Chemical Characteristics of the Profundal Zone of Lakes, 1136
Rydberg Centennial Conference on Atomic Line Spectra (Swedish National Committee for Physics), 729
Ryder, M. L., and Auber, L. : Abnormal Growths associated with Wool Follicles in Sheep, 743
Ryle, Martin : Awarded the Hughes Medal for 1954 of the Royal Society, 908, 1032 , work of, 1032

SABATIER, Paul, 1854–1941 (Prof. J. R. Partington), 859
Sabena International Prize, 955
Sacra, P. (Parkes, M. W., and) : Inability of Acetylcholine Antagonists to protect Mice against the Toxicity of 'Tensilon', 969
Sadler, D. H. : The Reopening of Pulkovo Observatory, 153
Saffran, Dr. M., and others : Adrenocorticotrophic Activity of Melanophore-expanding Hormone Preparations from Beef Pituitary Glands, 1106
Sage, A. M. : Awarded a Mond Nickel Fellowship for 1954, 1174
Sagal, K., and others : Titanium Nitride and Titanium Carbide as Semi-conductors, 1154

Saha Prof. Meghnad—his Life, Work and Philosophy (edited by S. N Sen), *review* by Prof. F. J. M. Stratton, 528
Saldía, Leo E. A. (edited by Miller, Walter J., and) : Engineers as Writers, *review* by R. H. Macmillan, 622
Sainsbury, J. C. : Awarded the Institution of Naval Architects Scholarship in Naval Architecture, 864
Saipan in the Mariana Islands : Ethnology of (Alexander Spoehr), 19
Salam, Dr. Abdus . Geometrical Mechanics and de Broglie Waves, *review*, 900
Salaman, Dr. R. N. : Science and the Potato, *review*, 98
Salicylamide : Enzymatic Conversion of Salicylhydroxamic Acid to (Prof. Julius Lowenthal), 36
Salicylhydroxamic Acid : Enzymatic Conversion of, to Salicylamide (Prof. Julius Lowenthal), 36
Salicyloylhydrazide, a Reagent of Wide Use in Organic and Histochemical Analysis (Dr. B. Camber), 1107
Saline Water : Reviews of Research on Problems of Utilization of (Unesco Arid Zone Programme), 782
Saline and Brackish Water : Plant Cultivation in (Dr. A. Allsopp), 782
Salisbury, Sir Edward : Weed Control, 1178
Salisbury, Marquess of : Rubber Technology, 168
Address at the special meeting of the Institution of Electrical Engineers to celebrate the jubilee of the invention of the Thermionic Valve, 1076
Salmo trutta L. : Spawning Migration, Reproduction and Young Stages of Loch Trout (T. A. Stuart), 342
Salmon Migration and the Environment (Prof. A. G. Huntsman), 215
Salmony, Miss D. : Awarded a Stothert Research Fellowship of the Royal Society, 18
Salomon, Dr. Kurt, and others : Biosynthesis of Haemin in Soy-bean Nodule Homogenates, 34
Salpeter, Rev. E. W. (Junkes, Rev. J., and) : Unusual Doubling of Spectral Lines, 138
Salt Concentration : Fractionation of Deoxyribonucleoprotein by Successive Extraction with Constant (J. A. Lucy and Prof. J. A. V. Butler), 32
Salt Water in the Hydroelectric Pile : Production of Electric Power by mixing Fresh and (R. E. Pattle), 660
Salters' Company : Awards for 1954–55, 112
Saltu, Y. : Conservation of Nature in the Near and Middle East, 288
Salton, M. R. J. : Bakterien unter Hemmstoffwirkung, *review*, 480
Salts (Molten) : Reactions of, with Layer-Lattice Silicates (Joe L. White), 799
Salvatori (Henry) Laboratory of Geophysics, Stanford University, California (Prof. Joshua L. Soske), 255
Samal, K. (Datta, Prof. A. K., and) : Ultrasonic Absorption in Castor Oil, Carbon Disulphide, Benzene and Xylene, 976
Sample Holders (Nickel and Porous Alumina) : Comparative Performance of, for Differential Thermal Analysis (T. L. Webb), 686 ; (Dr. Robert C. Mackenzie), 688
Samuelson, Prof. Olof : Ion Exchanges in Analytical Chemistry, *review* by E. Q. Laws, 1119
Sand Culture : Relation of Nitrogen Supply to the Molybdenum Requirement of Tomato Plants grown in (Dr. E. J. Hewitt and Dr. C. C. McCready), 186
Sanders, Dorothea F. (Mackerras, Dr. M. Josephine, and) : Life-history of the Rat Lung-worm and its Migration through the Brain of its Host, *erratum*, 164
Sandeman, N. S. : Appointed game ranger, Kenya, 344
Sanders, Prof. H. G. : Weed Control, 1177
Sandwell, B. K. : Canada's To-morrow, 212
Sandy Podsols (Acid) : Micro-fungal Population of (Dr. Ethel L. McLennan and Sophie C. Ducker), 1060
Sandys, Duncan . Problems of Aircraft Noise, 119
Sänger, Prof. R. : Physics of Clouds and Precipitation, 957
Sanger, Dr. Ruth, and others : A Position Effect of the *Rh* Blood-Group Genes, 460
Sanger's Reagent : Polymerization Reactions occurring during Dinitrophenylation of α-, β- and ω-Amino acids with (D. Heikens, Dr. P. H. Hermans and P. F. van Velden), 1187
Sangoan Culture : The Kalahari Sands of the Lunda (N. E Angola), their Earlier Redistribution and the (J. Janmart), *review* by M. C Burkitt, 331
Sangster, R. G. : Appointed chief conservator of forests, Tanganyika, 492
Sanguins chez les animaux : Les groupes (Dr. R. Dujarric de la Rivière et Dr. A. Eyquem), *review* by Dr. A. E. Mourant, 898
Santapau, H. : The Flora of Khandala on the Western Ghats of India, 66
Sarabhai, Dr Vikram A. : Ahmedabad Textile Industry's Research Association, 578
Saran, Shiv, and others : Low-temperature Sintering of Titanium Dioxide for Ceramic Capacitors, 1187
Sarcoma Cells : Invasiveness of (M. Abercrombie and Dr. Joan E. M. Heaysman), 697
Sarcosomes (Heart) : Phosphorylation coupled with the Oxidation of Ferrocytochrome c by (Dr. E. C. Slater), 1143
Sarginson, E. J. : Appointed lecturer in civil engineering at the University of Sheffield, 113
Sarjant, Prof. R. J. : The Murdoch Bicentenary, 822
Sarkar, Dr. P. B. : Pentoses associated with Jute α-Cellulose, 229
Sasaki, Prof. Nobuji, and Onchi, Masaru : Effect of Vapours of Halogen Compounds on the Emission of Positive Ions from Platinum, 84
Sastry, G. Sivarama (Krishnamurthi, M., and) : Transition Temperatures of Polymers at Ultrasonic Frequencies, 132
Saturated Fatty Acids (Straight-chain) : A Chromatographic Method for the Estimation of Oleic and Linoleic Acids in the presence of (W. Mary L. Crombie, R. Comber and S. G. Boatman), 181
Saturnia pavonia L. : Factors affecting the Larval Spot Colours of the Emperor Moth (D. B. Long), 563
Saunders, Sir Alan : Appointed a member of the National Research Development Corporation, 20
Sauvy, Prof. A. : Social and Individual Significance of Ageing, 682
Savoury, T. H. : Spiders of Britain, *review*, 100
Sawyer, Dr. W. H. : Comparative Endocrinology of Vertebrates, 544

  Presidential Address to the Archaeological Section (F. C. Elliston Erwood), 69
  Presidential Address to the Zoological Section (G E. Newell), 69
  Presidential Address to the Botanical Section (J. E. Lousley), 70
  Presidential Address to the Geological Section (H. E. P. Spencer), 70
Scientific Unions, International Council of . Year Book (1954), 1003
Scientific Work on Smokeless Fuels, 1130
Scientific Workers, Association of (Atomic Sciences Committee) : Notes on Nuclear Science, 776
Scientific and Industrial Research, Advisory Council for Appointment of new Members, 540
Scientific and Industrial Research, Central Laboratories for (Hyderabad) · Annual Report for 1952, 868
Scientific and Industrial Research, Council for (Pretoria) : Register of Current Scientific Research at South African Universities, 429
Scientific and Industrial Research, Department of : Amalgamation of the Electronics and the Control Mechanisms Sections of the National Physical Laboratory as the Control Mechanisms and Electronics Division, 110
  Appointment of R. H. Tizard as officer-in-charge of the Control Mechanisms and Electronics Division of the National Physical Laboratory, 110
  Appointment of E. I. Brimelow and A. J. Garrett as liaison officers at the National Physical Laboratory, 110
  Report of the Chemistry Research Board with the Report of the Director of the Chemical Research Laboratory for the Year 1953, 170
  Financial Estimates for the, 251, 341
  Report of the Hydraulics Research Board with the Report of the Director of Hydraulics Research for the Year 1953, 348
  Forest Products Research Laboratory, Bulletin No. 29, Comparison of 3-Plywoods of a Standard Thickness, Part I (W. T. Curry), 383
  Annual Report for 1953 of the Pest Infestation Laboratory, 491
  Report of the Fuel Research Board with the Report of the Director of Fuel Research for 1953, 588
  New Premises of the Water Pollution Research Laboratory, 589
  National Physical Laboratory Notes on Applied Science, No. 6, Volumetric Glassware—Scientific Aspects of Design and Accuracy, 635
  Report of the Building Research Station for 1953, 782
  Open Days at the Chemical Research Laboratory, Teddington, 817
  Report for 1953 of the Forest Products Research Board, 819
  Gift of £2,000 to the Department of Psychology, University of Leeds, for a research project on the comprehensibility of technical reports, 863
  Symposium at the National Physical Laboratory on Precision Electrical Measurements, 910
  National Physical Laboratory Notes on Applied Science, No. 7, Balances, Weights and Precise Laboratory Weighing, 1004
Scientific and Industrial Research, Department of, and Fire Offices' Committee · Fire Research Special Report No. 2, Heat Transfer by Radiation (J. H. McGuire), 490
Scientific and Technical Applications of Photography (Scientific and Technical Group of the Royal Photographic Society Conference on), 432
Scientific and Technical Books : Recent, Supp. viii, July 31 ; Supp. viii, August 28 ; Supp. viii, September 25 ; Supp. viii, October 30 ; Supp. viii, November 27 ; Supp. vi, December 25
Scientist, The, Vol. 1, Nos. 2 and 3 (Department of Zoology, University of Karachi), 430
Scientists (British) : United States Research Fellowships for, 164, 1173
Scientists in Communist China Position of (Dr. A. Z. Chang), 429
Scientists in Latin America : Scientific Institutions and, 1, Costa Rica, El Salvador, Guatemala, Honduras, Nicaragua and Panama (Unesco Science Co-operation Office for Latin America), 430
Scintillation Counter · Luminescence and the (Dr. S. C. Curran), *review* by Dr. Ernst Breitenberger, 239
Scintillation Counters, *review* by Dr. Ernst Breitenberger, 239
Scintillation Counters (Prof. J. B. Birks), *review* by Dr. A. R. Crathorn, 810
Scintillation Counters and Phosphors, *review* by Dr. A. R. Crathorn, 810
Scotland : Occurrence of *Paracentrotus lividus* (Lamarck) in (Edith A. T. MacEwen and A. D. Hobson), 752
Scott, B. I. H. (McAulay, Prof. A. L., and) . A New Approach to the Study of Electric Fields produced by Growing Roots, 924
Scott, Dukinfield Henry (1854–1934), (Dr. Agnes Arber), 992
Scott, G R. · Thermal Reactions of Kenya Cattle vaccinated with Lapinized Rinderpest Virus, 44
Scott, J. A. : Social and Individual Significance of Ageing, 683
Scott, Dr. J. R. Physics of Rubber, 169
Scott, Peter · Appointed a member of the Advisory Committee on the Protection of Birds for England and Wales, 1086
Scottish Agriculture : Meteorology and (Royal Meteorological Society Symposium on), 493
Scottish Geographical Society, Royal : Election of Dr. D. A. Allan as president, 821
Scottish Museum (Royal), Edinburgh (1854–1954), (Dr. F. S. Wallis), 332
Scottish Museum, Royal (British Museum (Natural History) and the) : Training in Taxidermy, 66
Scrophulariaceae and Orobanchaceae : Cytology of the (David J. Hambler), 838
Sea-horses in a School Laboratory (A. S. Gillespie), 539
Sea Water : Bursting of Air Bubbles at the Surface of (B. J. Mason), 470
  Cadmium in (J. B Mullin and Dr. J. P. Riley), 42
  A Chainomatic Pycnometer for the Determination of Chlorine in (D. J. Rochford), 641
Sea Waves : Finding the Direction of Travel of (N. F. Barber), 1048
Seaborg, G. T. : The Actinide Series (Comprehensive Inorganic Chemistry, edited by Prof. M. Cannon Sneed, Prof. J. Lewis Maynard and Prof. Robert C. Brasted, Vol. I), *review* by Dr. R. Spence, 944
Seaman, Alan, and others : Bacterial Antagonism by *Serratia marcescens*, 406
Searle, Dr. G. F. C. : *Death* of, 1174
Sears, Prof. Francis Weston . An Introduction to Thermodynamics, the Kinetic Theory of Gases, and Statistical Mechanics, second edition, *review* by R. W. Haywood, 240
Seasonal Regulation in British Dragonflies (Philip S. Corbet), 655, *erratum*, 777
Seasons : Phenology—the Study of the (Dr. C. B. Williams), 445
Second Ecdysis of Infective Nematode Larvae (R. I. Sommerville), 751
Second Virus Disease of the Leatherjacket, *Tipula paludosa* (N. Xeros), 562
Secretion of Aldosterone and Corticosterone by the Rat Adrenal (Bertha Singer and M. P. Stack-Dunne), 790
Secretion of Juvenile Hormone by the Corpus Allatum of *Calliphora* (Prof V. B. Wigglesworth), 556
Seed (Tomato) . Internal Infection of, by *Didymella lycopersici* Kleb. (Dorothy E. Fisher), 656
Seed of Birch (*Betula pubescens* Ehrh.) · Photoperiodic Control of Germination in (M. Black and Dr. P. F. Wareing), 705
Seed Dressings for the Control of Wheat Bulb Fly (H. C. Gough and A. Woods), 1151
Seedlings (*Avena*) · Growth of Wounded Etiolated (C. L. Mer), 680
Seedlings (Barley) Succinoxidase Inactivation by a Lecithinase in (Brian C. Goodwin and E. R. Waygood), 517
Seeger, — . : Mechanical Effects of Dislocations in Crystals, 378
Segner, J A. von (1704–77), 678
Segregating for a Lethal or other Epistatic Factor . Analysis of Unordered Tetrads (Dr. H. L. K. Whitehouse), 463
Seidell, Dr. Atherton : Awarded a Scroll of Appreciation by the American Documentation Institute, 998
Seine Les Limons quaternaires du bassin de la—Stratigraphie et archéologie paléolithique (François Bordes), *review* by M. C. Burkitt, 987
Seismological Society of America · An Engineering Study of the Southern Californian Earthquake of July 21, 1952, and its Aftershocks (Karl V. Steinbrugge and Donald F. Moran), 909
Seismology in New Zealand during 1951–53, 863
Select Committee on Estimates : Fifth Report, Session 1953–54, Agricultural Research, 663, 955
Selection of Supervisors (J. D. Handyside and D. C. Duncan), 300
Seligman, G. : Reference to the obituary notice of Prof. A. B. Dobrowolski, 20
Selle, Prof. Raymond M. : Determination of Sour Orange Rootstock by Paper Chromatography, 140
Selwood, A. : Awarded a postgraduate research scholarship by Courtaulds' Scientific and Educational Trust Fund, 492
Semiconductors . Titanium Nitride and Titanium Carbide as (Prof. A. Munster, K. Sagel and G. Schlamp), 1154

Sen, S. N. (edited by): Professor Meghnad Saha: his Life, Work and Philosophy, *review* by Prof. F. J. M. Stratton, 528
Senaldi, Mario: Anatomia e la fisiologia di Leonardo da Vinci, *review*, 152
Sengupta, Purnima (Bose, A. K., and): X-Ray and Differential Thermal Studies of some Indian Montmorillonites, 40
Senses: The Human (Prof. Frank A. Geldard), *review* by Prof. John Cohen, 417
Senses of the Honey Bee: Life and, *review* by Dr. W. H. Thorpe, 897
Sensitive Parallax Detector for Optical Bench (Dr. John J. Dowling), 465
Sensitivity to X-Rays: Deoxyribonucleoproteins of Cell Nuclei— (Maurice H. Bernstein), 463
Sensitivity Curves: Electroretinal Photopic (Dr. E. P. Johnson and T. N. Cornsweet), 614
Sensory Gateway to the Mind, *review* by Prof. John Cohen, 417
Sensory-Motor Reaction: Antagonist Inhibition as the Earliest Sign of a (H.-J. Hufschmidt and Tamara Hufschmidt), 607
Separation of Plant Tissues: Mechanical (C. G. Jarman), 890
Separation of Proteolytic Enzymes of *Clostridium histolyticum* (Robert DeBellis, Ines Mandl, John D. MacLennan and Edward L. Howes), 1191
Septicaemia (*Shigella sonnei*): A Case of, in a Calf (Dr. J. Deom and Dr. J. Mortelmans), 316
Serial Sections of the Lung projected rapidly in Sequence using 16-mm. Film: Photographs of (Dr. Brian E. Heard), 319
Series, G. W.: Atomic Line Spectra, 730
Serine: Participation of Pyridoxal Phosphate in the Enzymic Synthesis of (R. L. Blakley), 652
Serine in Bakers' Yeast: Origin of Glycine and (Chih H. Wang, J. Wendell Davis, Vernon H. Cheldelin and Prof. Bert E. Christensen), 1145
Serological Distinction between the Haemagglutinins of *Dolichos biflorus* and *Phaseolus lunatus*: A Further (Lieut.-Colonel G. W. G. Bird), 1015
Serous Cells in Brunner's Glands of the Rabbit (B. F. Martin), 1195
Serpentine: External Metasomatism associated with (Sir Edward Bailey and Prof. W. J. McCallien), 836
Serratia marcescens: Bacterial Antagonism by (Alan Seaman, Dr. Malcolm Woodbine and Anna Kolasiewicz), 406
Serum (Human): Neutralization of Silkworm Jaundice Virus by (K. Aizawa), 748
Serum Proteins: Fractionation of, by Zone Electrophoresis in Glass Powder (C. J. Bradish and Nan V. Smart), 272
Servetus, Michael—a Translation of his Geographical, Medical and Astrological Writings, with Introductions and Notes (Dr. Charles Donald O'Malley), *review* by Dr. Douglas Guthrie, 941
Servetus, Michael—Humanist and Martyr (Prof. John F. Fulton), *review* by Dr. Douglas Guthrie, 941
Setälä, Prof. Kai: Experimental Chemical Carcinogenesis and the Influence of Solvents—Research in Finland, 873
Settlement of Pigmented Systems: Rheology and (Oil and Colour Chemists' Association Symposium on), 344
Seven-day Week: Calendar Reform and the (Elisabeth Achelis, James Avery Joyce and Daniel Sher), 488
Seventeenth Century: Sir William Petty, a Genius of the, *review* by Dr. A. R. Hall, 573
Seventeenth-Century Chemistry, the Phlogiston Theory and Dalton's Atomic Theory (Prof. J. R. Partington), 291
Sewell, P. R.: Awarded a postgraduate research scholarship by Courtaulds' Scientific and Educational Trust Fund, 492
Sex: Reproduction and (Dr. G. I. M. Swyer), *review* by Dr. Clifford Allen, 763
 The Way of, *review* by Dr. Clifford Allen, 763
Sex and the Nature of Things (Dr. N. J. Berrill), *review* by Dr. Clifford Allen, 763
Sex Linkage in the Mouse: Partial (T. C. Carter, Mary F. Lyon and Rita J. S. Phillips), 309; (B. M. Slizynski), 310
Sex Ratio of a Plant Parasitic Nematode: Environmental Determination of the (Dr. C. Ellenby), 1016
Sexual Behaviour in the Ewe: Effect of Thyroxine on (F. M. Labban), 933
Shackle, Prof. G. L. S.: Automatic Control for Economic Systems, *review*, 421
Shafei, M. M. (Hafez, Dr. E. S. E., and): Sweating Mechanism in the Domestic Buffalo, 1181
Shafiq, S. A.: The Golgi Apparatus, 22
Shallow Incisions: Effect of Deep and, on Organogenesis at the Fern Apex (Prof. C. W. Wardlaw and E. G. Cutter), 734
Sharif El Din, Hamid, and Jones, K. Wilson: Copper Sulphate as an Aquatic Herbicide, 187
Sharland, T. R., and others: Submerged Culture Production of Diphtheria Toxin, 557
Sharon, N., and others: Classification of the Antifungal Antibiotics from *Bacillus subtilis*, 1190
Shaw, Dr. C. Warren: Weed Control, 1178
Shaw, Prof. F. H., and others: Barbiturate Antagonism, 402
Shaw, F. S.: An Introduction to Relaxation Methods, *review* by Prof. G. Temple, 714
Shear Modes in Isotropic Media: A Modified Wedge Method for exciting (Dr. B. Ramachandra Rao and P. Venugopala Rao), 835
Shearer, Dr. H. M. M.: Appointed to an I.C.I. Fellowship in the University of Glasgow, 1039
Sheep: Abnormal Growths associated with Wool Follicles in (M. L. Ryder and L. Auber), 743
 Augmentation of Wool-growth by l-Thyroxine and Tri-iodo-thyronine in (D. S. Hart), 1018
 Electrolyte Concentrations in Red Blood Cells of British Breeds of (John V. Evans), 931
 A Method of collecting Fluid leaving the Omasum of (Prof. J. H. Bouckaert and W. Oyaert), 1195
 Pelvic Relaxation in (Mrs. E. G. Bassett and D. S. M. Phillips), 1020
 Successful Inter-breed Transfer of Ova in (G. L. Hunter, C. E. Adams and L. F. Rowson), 890
Sheep Biology Laboratory, Prospect, N.S.W.: Appointment of Dr. L. W. McDonald as officer-in-charge, 1130
Sheldon, Dr. J. H.: Social and Individual Significance of Ageing, 682
Shell of *Anodonta cygnea*: Properties of the Non-Calcareous Material in the (G. E. Beedham), 750
Shell Mound at Palo Seco, Trinidad: On the Excavation of a (J. A. Bullbrook), *review* by Dr. G. H. S. Bushnell, 287
Shells of *Murex tribulus* from the Great Bitter Lake, Egypt: Variation of the (Dr. Monica Taylor), 1111
Shenstone, Prof. A. G.: Atomic Line Spectra, 729
Shepherd, Dr. R.: Resignation as senior lecturer in the Postgraduate School of Mining, University of Sheffield, 820
 Appointed a senior scientist with the National Coal Board, 820
Shepherd, the late Dr. W. C. F.: Spontaneous Ignition of an Inflammable Gaseous Mixture on Release from Compression, 658
 Obituary by H. C. Grimshaw, 487
Sheppard, N.: Molecular Spectroscopy, 1166
Sher, Daniel, and others: Calendar Reform and the Seven-day Week, 488
Sheridan, Dr. J., and Thomas, Dr. L. F.: Microwave Spectrum of Methyl-Cyanoacetylene, 798
Sherwood, Dr. S.: Chemistry in relation to the Development of the Nervous System, 457
Shewan, Dr. J. M.: Promoted to Senior Principal Scientific Officer in the Scientific Civil Service, 1000; work of, 1000
Shielding Efficiency of Cations (Dr. L. H. Ahrens), 644
Shift Work in Industry (F. P. Cook), 1093
Shigella sonnei Septicaemia in a Calf: A Case of (Dr. J. Deom and Dr. J. Mortelmans), 316
Shillibeer, H. A., and others: Estimates of Age for some African Minerals, 1006
Shilo, M., and others: Restriction of Inflammatory Response by Polysaccharides, 786
Shimmin, Prof. A. N.: The University of Leeds—The First Half-Century, *review* by Prof. R. Whiddington, 196
 Title of emeritus professor of social studies in the University of Leeds conferred on, 863
Shintani, Shigeru, and others: Antitoxopyrimidine Action of Vitamins of the B_6 Group, 275
Shipman, A. D.: Elected a Salters' Scholar for 1954–55, 112
Shisham (*Dalbergia sissoo* Roxb.): Wilt of, due to *Fusarium solani* sensu Snyder and Hansen (Dr. B. K. Bakshi), 278
Shrives, Miss M. G.: The Species Concept in relation to the British Flora, 246
Shoenberg, Dr. D.: Superconductivity, second edition, *review* by Dr. K. Mendelssohn, 477
 Obituary of E. Laurmann, 1129
Shoot Development: Effect of Shoot Orientation on Leaf and (J. H. Palmer), 85
Shoot Orientation: Effect of, on Leaf and Shoot Development (J. H. Palmer), 85
Shorland, Dr. F. B.: Occurrence of Fatty Acids with Uneven-numbered Carbon Atoms in Natural Fats, 603
Shorland, Dr. F. B., and others: Isolation of *n*-Heptadecanoic Acid from Hydrogenated Mutton Fat, 39
 Occurrence of *trans*-Acids in Animal Fats, 185
Short-range Electrical Forces between Charged Colloid Particles (Dr. D. M. C. MacEwan), 39
Shotton, D. M.: Human Infertility, 493
Shove, Miss Rosamund F.: *Obituary* by Miss Madeline Munro, 995
Shrew (Tree): Breeding of the (J. R. Hendrickson), 794
Shulman, A., and others: Barbiturate Antagonism, 402
Shuttleworth, Dr. R.: Appointed a lecturer in metallurgy in the Department of Coal Gas and Fuel Industries with Metallurgy and Chemical Engineering, University of Leeds, 863
Sickle-Cell Haemoglobins: Ability of Normal and, to form Complexes (C. G. Anderson and S. B. Griffiths), 928
Sidey (T. K.) Summer-time Award for Research on Electromagnetic Radiation (Royal Society of New Zealand), 955
Sidgwick, J. B.: William Herschel, Explorer of the Heavens, *review* by C. A. Ronan, 329
Siegbahn, Dr. K.: Nuclear and Meson Physics, 531
Significance of Metallic Transfer in Orthopaedic Surgery (Dr. F. P. Bowden, J. B. P. Williamson and P. Gowans Laing), 834
Silane and Germane: Bond-Lengths and Force Constants for Methane, (R. A. Ballinger and N. H. March), 179
Silcock, H.: Financial Effect of Labour Turnover, 1180
Silicates (Layer-Lattice): Reactions of Molten Salts with (Joe L. White), 799
Silicones: Production of—New Plant at Barry, Glamorgan, 1041
Silk: A New Solvent for (Christopher Earland and David J. Raven), 461
Silk Fibroin: Basic Amino-acids of (M. C. Corfield, F. O. Howitt and A. Robson), 603
Silkworm: Mechanism of the Formation of Red Melanin in the (Kaoru Inagami), 1105
Silkworm Jaundice Virus: Neutralization of, by Human Serum (K. Aizawa), 748
Siloxanes (Poly-di-methyl): Surface Films of, on Organic Liquid Substrates (W. H. Banks), 365
Silver Ions: Effect of, on Mitochondrial Adenosine Triphosphatase (J. B. Chappell and G. D. Greville), 930
Sim, A. C., and Lewin, L.: Point Source and Sink in a Parallelepiped, 1155
Sim, G. A.: Awarded a Ramsay Memorial Fellowship for 1954–55 for research in chemistry, 112
Simeral, W. G., and others: The Problem of the Two Types of Diamond, 901

Spoel, H.: Elected a Salters' Scholar for 1954–55, 112
Spontaneous Fission Properties of Elements 97, 98, 99 and 100 (P. R. Fields, M. H. Studier, L. B. Magnusson and J. R. Huizenga), 265
Spontaneous Ignition of an Inflammable Gaseous Mixture on Release from Compression (the late Dr. W. C. F. Shepherd), 658
Spontaneous Triploidy in Mouse Embryos: Independence of Delayed Fertilization and (A. H. Gates and Dr. R. A. Beatty), 356
Sporadic E Ionization of the Ionosphere: Thunderstorms and (Prof. S. K. Mitra and M. R. Kundu), 798
Sporangia (*Phytophthora palmivora*): Use of Ultra-violet Fluorescent Substances for Observations on Dispersal of (C. A. Thorold), 409
Sports Turf Research Institute: Silver Jubilee, 213
Spot Colours (Larval): Factors affecting the, of the Emperor Moth, *Saturnia pavonia* L. (D. B. Long), 563
Spray Reagent for Paper Chromatography of Polyols and Cetoses: A New (Dr. Paul Godin), 134
Sprays (Nutrient): Absorption by Leaves from (G. N. Thorne), 111
Spreading the Chromosomes in the Rabbit Blastocyst: A Simplified Method for (Ole Venge), 608
Spriestersbach, D. (Smith, Prof. F., and): Paper Chromatography of Organic Acids, 466
Squalene: Action of, upon Carcinogenic Hydrocarbons (Dr. Harry Sobel and Jessie Marmorston), 553
Squires, Dr. G. L.: Awarded a Research Fellowship in the United States by the National Academy of Sciences, Washington, 1173
Sripathi, C. E. (Naganna, Dr. B., and): Pyrophosphatases in Plants during Growth, 593
St. Aldwyn, Lord: Appointed chairman of the Myxomatosis Advisory Committee, 1132
St. Ives Research Station: Silver Jubilee of the Sports Turf Research Institute, 213
St. Mary's Hospital Medical School, London: Appointment of Dr. A. Neuberger to a University of London chair of chemical pathology, 537
Stability in Development and Relational Balance of X-Chromosomes in *Drosophila melanogaster* (G. Tebb and Dr. J. M. Thoday), 1109
Stability of Metal Complexes: Electronegativity and the (Dr. D. Chapman), 887
Stability of Rotating Liquid Masses (Dr. R. A. Lyttleton), *review* by Prof. W. H. McCrea, 621
Stability of the Sun, *review* by Prof. E. N. da C. Andrade, 420
Stabilization of Free Radicals by Adsorption—Detection by Paramagnetic Resonance (Dr. D. Bijl, Dr. H. Kainer and A. C. Rose-Innes), 830
Stace, V. D.: The Pacific Islander and Modern Commerce, 679
Stack-Dunne, M. P. (Singer, Bertha, and): Secretion of Aldosterone and Corticosterone by the Rat Adrenal, 790
Stadler, Prof. L. J.: *Obituary* by Prof. S. C. Harland, 676
Staffing of Grammar Schools (W. E. Egner and A. Young), 208
Stagg, Dr. J. M.: Weather Forecasting, 674
Staining of Bound Lipids (M. C. Berenbaum), 190
Staining Reactions of Elastic Fibres with special reference to 'Elastotic Degenerations' in the Human Skin (Prof. Theodore Gillman, Jack Penn, Doris Bronks and Marie Roux), 789

Staining Technique : Differentiation of Growing and Non-Growing Bacteria by a (H. E. Wade and D. M. Morgan), 920, erratum, 1087
Stakman, Prof. E. C. : Progress and Problems in Plant Pathology, 766
Stamp, Prof. L. Dudley : Fifth International West African Conference, 21
Food and Population, *review*, 422
Standard Weight for Karachi Mint, Pakistan : Ten-Tola Primary (L. Oertling, Ltd.), 296
Manufacture of the Ten-Tola Primary (Dr. G. P. Hodsman), 1094
Standards Institution, British : Appointment of Dr. G. H. Beaby as chairman of the Chemical Divisional Council, 488
British Standard 2520, Barometer Conventions and Tables, 1127
Standards and Levels of Living : Report on International Definition and Measurement of (United Nations, the International Labour Office and Unesco), 350
Stanford Research Institute, California : Annual Report for 1953, 170
Named by the United States Atomic Energy Commission as a depository of unclassified information on atomic energy, 341
Stanford University, California : Henry Salvatori Laboratory of Geophysics (Prof. Joshua L. Soske), 255
Stanier, J. E. (Philpot, J. St. L., and) : Electrophoretic Migration of Contents of Intact Liver Nuclei, 651
Stanier, R. Y. (Sistrom, W. R., and) : Enzymatic Conversion of Two Geometrical Isomers into Enantiomorphs, 513

Stanković, S. : Biological, Physical and Chemical Characteristics of the Profundal Zone of Lakes, 1137
Stark, G. W. E., and Fougere, G. L. : Artificial Increase of Electrical Breakdown Strength of Air at Low Pressure in the Region of 300 Mc./s., 1066
Stars : New General Catalogue of Nebulæ and Clusters of (J. L. E. Dreyer), 634
Stars in the Making (Dr. Cecilia Payne-Gaposchkin), *review* by Prof. W. H. McCrea, 852
Starved Milkweed Bugs : Corpus allatum and Egg Production in (A. S. Johansson), 89
State (Modern) : Power and Influence in the, 759
State (Welfare) : Beginnings of a, *review* by Miss M. P. Hall, 851
Statham, Prof. I. C. F. : Retirement from the chair of mining in the University of Sheffield, 250 ; work of, 250
Title of emeritus professor of mining in the University of Sheffield conferred on, 1174
Statistical Mechanics : An Introduction to Thermodynamics, the Kinetic Theory of Gases, and (Prof. Francis Weston Sears), second edition, *review* by R. W. Haywood, 240
Statistical Method of Estimating the Periods of Incubation and Infection of an Infectious Disease (Norman T. J. Bailey), 139
Statistics : Postdoctoral Fellowships in (University of Chicago), 777
Stearic Acid Monolayers : Reaction of, with Copper and Cuprous Oxide (Alan Dobry and Henry E. Mahncke), 507 ; (Dr. D. Tabor), 507
Stebbing, Prof. E. P. : Forestry in New Zealand, 173
Forestry in British Honduras, 260
World Population and Resources, 678
Oxford System of Decimal Classification for Forestry, 869
Forestry Commission—Report for the Year 1952–53, 1093
Stedeford, I. A. R. : Appointed a member of the United Kingdom Atomic Energy Authority, 64
Stedman, Dr. E., and others : Abnormal Properties of Histones from Malignant Cells, 580
Steel, Robert W. : Canada's To-morrow, 212
Steel : Hydrogen in the Manufacture of (K. C. Barraclough), 111
Steel Building Frames : Design of, *review* by Prof. W. Fisher Cassie, 1026
Steel Skeleton (Prof. J. F. Baker), Vol. 1, Elastic Behaviour and Design *review* by Prof. W. Fisher Cassie, 1026
Steers, Prof. J. A. : The Coast and the Geographer, 440
Stefanelli, Prof. Alberto : Autonomous Differentiation of some Chick Neurons isolated in Chorion-Allantoic Grafts, 974
Stein, Sir Edward de : Appointed a member of the National Research Development Corporation for a further period, 20
Stein, W. D. : A Comparison of some Natural and Synthetic Melanins, 601
Steinbock, O. : Biological, Physical and Chemical Characteristics of the Profundal Zone of Lakes, 1136
Steinbrugge, Karl V., and Moran, Donald F. : An Engineering Study of the Southern Californian Earthquake of July 21, 1952, and its After-shocks (Seismological Society of America), 909
Stellar Velocity Ellipsoid : Constants of the (D. G. Ewart), 297
Stem : Acceleration of Flowering in Non-vernalized Chrysanthemums by the Removal of Apical Sections of the (Dr. D. Vince and D. T. Mason), 842 ; (Dr. W. W. Schwabe), 1022
Stemme, Erik : Awarded a Gold Medal of the Swedish Academy of Engineering Sciences, 955
Stening, T. C. : Awarded a postgraduate research scholarship by Courtaulds' Scientific and Educational Trust Fund, 492
Steno (Nicolaus), Seventeenth-Century Anatomist, Geologist and Ecclesiastic (V. A. Eyles), 8
Stephenson, Dr. John L. : Caution in the Use of Liquid Propane for Freezing Biological Specimens, 235
Stephenson, Prof. T. A. : British Medusae, *review*, 151
Stereochemistry (Prof. T. S. Wheeler), 590
Stereochemistry of Cocaine (Prof. G. Fodor, Ö. Kovács and I. Weisz), 131
Sterilization (Root) : A Centrifuging Method for (John C. Hopkins), 1016
Steroid Systems : Fluorescent Glass Models of *cyclo*Hexane, Decalin and (W. Brady), 590
Steroid Reference Collection (Medical Research Council), 678
Steroid-Detergent Mixtures in Aqueous Buffers : Solubility and Electrophoretic Behaviour of (Dr. Otto J. Schmid and Dr. Klaus D. Voigt), 129
Steroids : Infrared Absorption Spectra of (Konrad Dobriner, E. R. Katzenellenbogen and R. Norman Jones), *review* by Dr. A. E. Martin, 945
Steroids (Adrenocortical) : The Determination of, and their Metabolites (Proceedings of a Conference held by the Society for Endocrinology, edited by P. Eckstein and S. Zuckerman), *review* by Dr. N. R. Lawrie, 52
Sterry, J. R. : Appointed agricultural officer, Gold Coast, 864
Stetten, Jun., Dr. DeWitt : Awarded the Alvarenga Prize for 1954 by the College of Physicians of Philadelphia, 344
Steven, G. A. : Fish Culture in Indonesia, 961
Steven, Prof. H. M. : The Practice of Forestry, *review*, 417
Stevens, G. W. W. (Davenport, A. N., and) : Use of X-Ray Film for comparing Radioactivities, 178
Stevenson, Earl P. : Basic Research in an Applied Research Laboratory, 1044
Stevenson, I. L. : Antibiotic Production by Actinomycetes in Soil demonstrated by Morphological Changes induced in *Helminthosporium sativum*, 598
Stevenson, J. P. : An Epizootic among Laboratory Stocks of the Desert Locust, *Schistocerca gregaria* Forsk, 222
Stewart, Alex : Basic Research in an Applied Research Laboratory, 1044
Stewart, J. W., and others : Development of Pain-producing Substance in Human Plasma, 791
Stewart, V. I. : Awarded a Nature Conservancy Research Studentship in Botany, 727
Steyermark, J. A., and collaborators : Contributions to the Flora of Venezuela, 66
Stigant, S. Austen : Introduction to Vector and Tensor Analysis, *review*, 1119
Stiles, Prof. Walter : Respiration in Plants, *review*, 328
Obituary of Dr. Herman A. Spoehr, 534
The Advance of Plant Physiology, *review*, 1074
Stimulation of the Discharge of Gametangia from a Brown Alga by a Change from Light to Darkness (Dr. Lionel Jaffe), 743
Stimulation of Rain in East Africa : Experiments on Artificial (D. A. Davies), 256
Stimulation of Wool Growth following Injections of Ox Growth Hormone : Prolonged (Dr. K. A. Ferguson), 411
Stimuli (Thermal) : Free Nerve Endings as Transducers of (H. J. V. Tyrrell, D. A. Taylor and C. M. Williams), 918
Stinson, Dr. P. A. : Tobacco Research Board of Southern Rhodesia—New Headquarters Station at Kutsaga, 25
Stockholm : Nuclear Reactor in, 161
Stoeckenius, W. (Peters, Dr. D., and) : Structural Analogies of Pox Viruses and Bacteria, 224
Stomatitis (Vesicular) : Infection of Chickens and Chick Embryos with the Viruses of Foot-and-Mouth Disease and of (H. H. Skinner), 1052
Stone, N. W. B. (Cook, A. H., and) : Angle of Contact of Mercury against a Moving Tungsten Wire, 366
Storage : Incorporation of Acetate-2-^{14}C into Human Erythrocyte Stroma as a Function of (Dr. K. I. Altman and Scott N. Swisher), 459
Storage of Plant Mitochondria (J. M. Tager), 932
Storage Tanks : Cathodic Protection of Pipelines and (V. A. Pritula), *review*, 376
Stored Products : Insect Pests of (Association of Applied Biologists Symposium on), 767
Stothert Research Fellowships of the Royal Society awarded to Dr. B. L. Ginsborg and Miss D. Salmony, 18
Straight-chain Saturated Fatty Acids : A Chromatographic Method for the Estimation of Oleic and Linoleic Acids in the presence of (W. Mary L. Crombie, R. Comber and S. G. Boatman), 181
Strano, Titina : Leonardo da Vinci—la vita, *review*, 152
Straten, F. W. van : Microseisms, 302
Stratford, R. K. : Canada's To-morrow, 212
Stratford Mill in Blaise Castle House Folk Park : Handbook to (City Museum, Bristol), 499
Stratigraphy : The Relationship of Palæontology to (Dr. C. J. Stubblefield), 439
Stratosphere (Lower) : Solar Tides in the (D. H. Johnson), 363
Stratton, Dr. F. : *Rh* Blood Group, *review*, 1029
Stratton, Prof. F. J. M. : Prof. Meghnad Saha—Sixtieth Birthday Tribute, review, 528
Science and Life, *review*, 665
Men of Cambridge, *review*, 896
Strauss, E. : Sir William Petty, Portrait of a Genius, *review* by Dr. A. R. Hall, 573
Strength Properties of Plywood, 383
Streptomyces : Decomposition of Oxalate by (S. R. Khambata and Prof. J. V. Bhat), 696
Streptomyces scabies : Isolation of a Phage Specific for (P. H. S. Newbould and E. H. Garrard), 997
Streptomycin : Effect of, on the Host-Pathogen Relationship of a Fungal Phytopathogen (Dr. K. O. Muller, J. H. E. Mackay and Janet N. Friend), 878
Stress Waves in Solids (H. Kolsky), *review* by Dr. R. E. D. Bishop, 527
Strickland, A. H. : Estimation of Losses from Pests, 541
Strobino, Giovanni : Leonardo da Vinci e la meccanica tessile, *review*, 152
Strøm, K. : Biological, Physical and Chemical Characteristics of the Profundal Zone of Lakes, 1136
Stroma (Human Erythrocyte) : Incorporation of Acetate-2-^{14}C into, as a Function of Storage (Dr. K. I. Altman and Scott N. Swisher), 459
Stroma (Human Red-Cell) : Electrophoresis of (T. A. J. Prankerd, Dr. K. I. Altman and J. R. Anderson), 1146
Strong, L. C. : Parental Age and Characteristics of the Offspring, 304
Strontium : Simultaneous Determination of Sodium, Potassium, Calcium, Magnesium and, by a New Multichannel Flame-Spectrometer (Dr. Bert L. Vallee), 1050
Stroud, S. W., and others : Heparin and Histamine in Mast-Cell Tumours from Dogs, 318
Structural Analogies of Pox Viruses and Bacteria (Dr. D. Peters and W. Stoeckenius), 224
Structural Changes in Boiling Solutions of Sugar with reference to Chromatography of Carbohydrates (Dr. T. H. Soutar and Evelyn Hampton), 801
Structural Changes during the Fatigue of Copper (R. B. Davies), 980
Structural Units in Collagen Fibrils (A. C. T. North, P. M. Cowan and Prof. J. T. Randall), 1142
Structure of the Atom : A New Periodic Table of the Elements based on the (Dr. S. I. Tomkeieff), *review* by Prof. F. A. Paneth, 420
Structure of Breath Deposits on Dielectric Oils (A. Brin), 468
Structure of the British Economy : The Changing (Prof. E. A. G. Robinson), 440

Structure of an *N*-isoButyldienediynamide from Pellitory (*Anacyclus pyrethrum* DC.): Isolation and (Dr. L. Crombie), 832
Structure of Collagen (G. N. Ramachandran and G. Kartha), 269
Structure of Cotton α-Cellulose (Dr. D. B. Das, M. K. Mitra and J. P. Wareham), 1058
Structure of Exocrine Cells of the Pancreas: Fine (Dr. Cyril E. Challice and Dennis Pacy), 1150
Structure des molécules: Les applications de la mécanique ondulatoire à l'étude de la (Réunions d'études et de mises au point tenues sous la présidence de Louis de Broglie), *review* by S. Weintroub, 989
Structure of Neo-Herculin from *Zanthoxylum clava-herculis* L.: Isolation and (Dr. L. Crombie), 833
Structure of Vitamin B_{12}—A Crystalline Nucleotide-free Degradation Product of Vitamin B_{12} (Dr. J. R. Cannon, Dr. A. W. Johnson and Sir Alexander Todd), 1168; X-Ray Crystallographic Evidence on the Structure of Vitamin B_{12} (Clara Brink, Dr. Dorothy Crowfoot Hodgkin, June Lindsey, Jenny Pickworth, John H. Robertson and John G. White), 1169
Structure and Texture of Metals (X-Ray Analysis Group of the Institute of Physics Conference on), 298
Structures of Molecules and Crystals of Fluorocarbons (C. W. Bunn and E. R. Howells), 549
Structures of Native and Mercerized Celluloses (Dr. J. O. Warwicker), 135; (H. J. Wellard), 135; (H. J. Woods), 136
Strychnos Alkaloids: Paper Electrophoresis of (Prof. G. B. Marini-Bettólo and Dr. M. Lederer), 133
Stuart, T. A.: Spawning Migration, Reproduction and Young Stages of Loch Trout (*Salmo trutta* L.), 342
Stubblefield, Dr. C. J.: The Relationship of Palaeontology to Stratigraphy, 439
Students (Degree): Modern Physics for, *review* by R. W. Haywood, 240
Studentships: Mr. and Mrs. John Jaffe Donation (Royal Society Awards), 164
Studentships in Chemistry: Research (British Celanese, Ltd., Awards), 681
Studentships in Ecology: Research (Nature Conservancy Awards), 727
Studier, M. H., and others: Spontaneous Fission Properties of Elements 97, 98, 99 and 100, 265
Study of Electric Fields produced by Growing Roots: A New Approach to the (Prof. A. L. McAulay and B. I. H. Scott), 924
Study of Fertility, Society for the: Annual Conference, 493
Study of Hail Formation and Hail Prevention, Swiss Federal Commission for the: International Symposium on Experimental Meteorology, 589
  International Symposium on the Physics of Clouds and Precipitation, 957
Study and Count of Soil Protozoa: Direct Microscopy for (Y. T. Tchan and J. S. Bunt), 656
Sturtevant, Prof. A. H.: Presidential Address to the Pacific Division of the American Association for the Advancement of Science, 960
Sub-Grain Boundary Corrosion in High-Purity Aluminium (M. Metzger and J. Intrater), 547
Sub-normal Vision: A New Development in Aids for (J. Lederer), 977
Sub-Tropical Climates (Tropical and): Breeding for Beef in (D. M. Joubert), 915
Sub-tropical Countries: Galactopoietic Action of Thyroxine in Cattle kept in (Prof. M. Maqsood), 185
Subject Index to Periodicals: Now published in quarterly issues, 589
Submarine Illumination and the Twilight Movements of a Sonic Scattering Layer (Elizabeth M. Kampa and Brian P. Boden), 869
Submerged Culture Production of Diphtheria Toxin (F. V. Linggood, A. C. Matthews, S. Pinfield, C. G. Pope and T. R. Sharland), 557
Subrahmanyan, V., and others: Rice Substitutes, 199
Subramaniam, Dr. A. P.: Given an award under the Royal Society and Nuffield Foundation Commonwealth Bursaries Scheme, 8
Substance P: Effects of Intraventricular Administration of (Prof. U. S. v. Euler and B. Pernow), 184
Substitute for Platelet Suspensions in the Thromboplastin Generation Test: A Brain Extract as a (Dr. W. N. Bell and H. G. Alton), 880
2: 6-Substituted Phenoxyacetic Acids: Growth-regulating Activity of certain (Daphne J. Osborne, Prof. G. E. Blackman, R. G. Powell, F. Sudzuki and S. Novoa), 742
Substrates (Organic Liquid): Surface Films of Poly-di-methyl Siloxanes on (W. H. Banks), 365
Successful Inter-breed Transfer of Ova in Sheep (G. L. Hunter, C. E. Adams and L. E. Rowson), 890
Succinic Acids from *d*-isoCitric Acid: The *d*-isoCitric Lyase System—the Formation of Glyoxylic and (Dr. J. A. Olson), 695
Succinoxidase Activity of the Flight Muscles of the Wasp, *Sceliphron caementarium* (Prof. Sol Kramer), 43
Succinoxidase Inactivation by a Lecithinase in Barley Seedlings (Brian C. Goodwin and E. R. Waygood), 517
Sucrose: Synthesis of, by a Partially Purified Plant Tissue Extract (Dr. J. F. Turner), 692
  Synthesis of, by Tobacco Leaves (P. V. Vittorio, G. Krotkov and G. B. Reed), 1038
Sudzuki, F., and others: Growth-regulating Activity of certain 2: 6-Substituted Phenoxyacetic Acids, 742
Sugar: Structural Changes in Boiling Solutions of, with reference to Chromatography of Hydrocarbons (Dr. T. H. Soutar and Evelyn Hampton), 801
Sugar Maple (*Acer saccharum*) in Ontario: Decay in the (V. J. Nordin), 343
Sugar Technology: Principles of (edited by Pieter Honig), *review* by H. C. S. de Whalley, 150
Sujansingani, K. H. (Jones, S., and): Fisheries of Lake Chilka, 1131
Sully, Dr. A. H.: Chromium, *review* by Dr. W. Hume-Rothery, 422
Sulphydryl Compounds: Use of *p*-Chloromercuribenzoic Acid in the Determination of Ascorbic Acid in the presence of (J. A. Owen, B. Iggo and D. B. Horn), 701
Sulphydryl Groups in Wool (Dr. R. W. Burley), 1019
Summer School at Knuston Hall (Universities Federation for Animal Welfare), 67
Summer School in Organic Chemistry (Institute of Chemistry of Ireland), 590
Summers, R.: *Obituary* of Dr. Neville Jones, 1037
Sumner, J. B.: Odour Research, 373
Sun: The Stability of the, *review* by Prof. E. N. da C. Andrade, 420
Superconductivity (Dr. D. Shoenberg), second edition, *review* by Dr. K. Mendelssohn, 477
  Theory of (M. von Laue), translated by Lothar Meyer and William Band, *review* by Dr. A. B. Pippard, 376
Supernumerary Pelvic Fin in the Powan (*Coregonus clupeoides* Lacépède), (F. W. K. Gervers), 935
Supervisors: Selection of (J. D. Handyside and D. C. Duncan), 300
Surface of Sea Water: Bursting of Air Bubbles at the (B. J. Mason), 470
'Surface Chilling': Influence of, on the Detonative Behaviour of Cast Trinitrotoluene (T. C. Tranter), 81
Surface Films of Poly-di-methyl Siloxanes on Organic Liquid Substrates (W. H. Banks), 365
Surfaces (Freshly Worked): Crystal Defects in (L. Grunberg and K. H. R. Wright), 657
Surgery (Orthopaedic): Significance of Metallic Transfer in (Dr. F. P. Bowden, J. B. P. Williamson and P. Gowans Laing), 834
Survey of Industry, Trade and Finance (Seymour Melman), 350
Survival of Bull Spermatozoa *in vitro*: Effect of Glycine on the (A. Roy and Marcus W. H. Bishop), 746
Survival-Rate of Anopheline Mosquitoes in Nature: Estimation of the (G. Davidson), 792
Sussex, I. M.: Experiments on the Cause of Dorsiventrality in Leaves, 351
Sutcliffe, J. F. (Reichenberg, D., and): Absorption of Ions by Plants, 1047
Sutcliffe, Dr. R. C.: Weather Forecasting, 673
Sutherland, Prof. G. B. B. M., and others: The Problem of the Two Types of Diamond, 931
Sutton, Dr. O. G.: Mathematics in Action, *review* by Prof. L. Rosenhead, 4
  Elected president of the Royal Meteorological Society, 67
  The Upper Atmosphere, 334
Swallow, Dr. J. C.: The Wonder of Plastics, 1040
Swaminathan, M., and others: Rice Substitutes, 199
Sweating Mechanism in the Domestic Buffalo (Dr. E. S. E. Hafez and M. M. Shafei), 1181
Swedish Academy of Engineering Sciences: Awards, 955
Swedish National Committee for Physics: Seventh General Physics Conference, 727
  Rydberg Centennial Conference on Atomic Line Spectra, 729
  Sixth General Physics Conference (1952), 863
Sweeney, Miss S. M.: Awarded a Postgraduate Scholarship in Husbandry by the Department of Agriculture for Scotland, 681
Sweet Potato Tissue infected with Black-Rot: Increase of Respiratory-rate in (Dr. Ikuzo Uritani, Takashi Akazawa and Miyoko Uritani), 1060
Sweetness and Configuration in Rhamnose (Prof. Yojiro Tsuzuki and Nobuo Mori), 458
Swensson, J. W.: Atomic Line Spectra, 731
Swift, P. McL., and others: Synthetic Rubbers, 169
Swisher, Scott N. (Altman, Dr. K. I., and): Incorporation of Acetate 2-^{14}C into Human Erythrocyte Stroma as a Function of Storage, 459
Swiss Federal Commission for the Study of Hail Formation and Hail Prevention: International Symposium on Experimental Meteorology, 589
  International Symposium on the Physics of Clouds and Precipitation, 957
Swollen Shoot Disease in Gold Coast Cacao: A Colour Test for detecting (T. W. Tinsley and G. Usher), 87
Swyer, Dr. G. I. M.: Fertility, 493
  Reproduction and Sex, *review* by Dr. Clifford Allen, 763
Swynnerton, R. J. M.: Appointed deputy director of agriculture, Kenya, 209
Sykes, Dr. A.: Appointed to a Research Fellowship in chemistry at the University of Birmingham, 1132
Sykes, Dr. C.: Appointed a member of the Advisory Council for Scientific and Industrial Research, 540
Sylvester, J. D., and others: Interdependence of Temporal and Auditory Judgments, 642
Symbols and Terminology used in Absorption Spectroscopy (P. W. D. Mitchell), 591
Symonds, K. V. (Audus, Prof. L. J., and): Plant Growth-regulating Substances, 768
Sympathectomy (Cervical): Effect of, on the Onset of Œstrus in Ferrets (M. E. Abrams, W. A. Marshall and A. P. D. Thomson), 311
'Symplasm' of *Vallisneria* Leaves: Transport of Chloride in the (Prof. W. H. Arisz), 223
Synchronous Induction Motor (J. Griffin), *review* by H. M. Clarke, 944
Synchrotron Radiations up to 100 million Electron Volts: Protection against Betatron and (National Bureau of Standards, Handbook 55), 340
Synge, Prof. J. L.: Geometrical Mechanics and de Broglie Waves, *review* by Dr. Abdus Salam, 900
Synoptic Meteorology: Vacation Course in (Royal Meteorological Society in conjunction with the Council for the Promotion of Field Studies), 633
Syntheses: Organic (edited by Charles C. Price), Vol. 33, 1953, *review* by Prof. John Read, 930
Synthesis of Branched Polymers (M. H. Jones, Prof. H. W. Melville and W. G. P. Robertson), 78
Synthesis of Casein: Use of Glutamine by the Mammary Gland for the (J. M. Barry), 315
Synthesis of Deoxyribonucleic Acid by Human Bone Marrow Cells *in vitro*: Utilization of Formate-^{14}C for (Dr. L. G. Lajtha), 1013
Synthesis of 4-Methyl-1: 2-Benzanthracene: A Novel (O. P. Vig, S. V. Kessar and Prof. S. M. Mukherji), 834
Synthesis of (±) Methyl Fluoromalate (N. F. Taylor and Dr. P. W. Kent), 401
Synthesis of γ-Methyleneglutamic Acid and γ-Methyleneglutamine (Dr. P. Wailes, M. C. Whiting and Dr. L. Fowden), 130
Synthesis of Serine: Participation of Pyridoxal Phosphate in the Enzymic (R. L. Blakley), 652
Synthesis of Sucrose by a Partially Purified Plant Tissue Extract (Dr. J. F. Turner), 692
Synthesis of Sucrose by Tobacco Leaves (P. V. Vittorio, G. Krotkov and G. B. Reed), 1038

Synthetic Activity of a Single Epithelial Cell of the Lactating Goat Udder (K. C. Richardson and Dr. S. J. Folley), 828
Synthetic Antispasmodics: New (Dr. J. Cymerman-Craig, K. V. Martin, P. C. Wailes, Prof. R. H. Thorp, R. Ladd and G. Thorburn), 231
Synthetic Fibres: Chemistry and Physics of (Plastics and Polymer Group of the Society of Chemical Industry Symposium on), 116
Synthetic Hormones: Inhibition of Vernalization in *Linum usitatissimum* Linn. by certain (Dr. S. C. Chakravarti), 461
Synthetic Melanins: A Comparison of some Natural and (W. D. Stein), 601
Synthetic Organic Chemistry (Romeo B. Wagner and Prof. Harry D. Zook), *review* by Prof. John Read, 576
Synthetic Polymers: Theory of, *review* by Prof. H. W. Melville, 52
Synthetically Modified Gelatin: Ion-Exchange Chromatography of Guanidino Amino-acids from (J. E. Eastoe and A. W. Kenchington), 966
System of Uranium Rods and Ordinary Water: Measurements on the Neutron Multiplication in a (Rolf Persson), 265, erratum, 636
Systematic Position of the Genus *Oscillospira* (A. A. Tuffery), 838
Szabó, S., and others: Contraction and Relaxation of Collagen Fibres, 788
Szent-Gyorgyi, Prof. A.: Chemical Physiology of Contraction in Body and Heart Muscle, *review* by J. R. Bendall, 477
Szilágyi, I., and others: Primycin, a New Antibiotic, 1105

T-TRANSFORMATION of the Erythrocytes *in vivo* with Purified Concentrated Enzyme: Haemolytic Anaemia produced Experimentally in the Guinea Pig by (P. Ejby-Poulsen), 929
Tabachnick, Milton, and others: A New Mixed Disulphide—Penicillamine-Cysteine, 701
Tabor, Dr. D.: Reaction of Stearic Acid Monolayers with Copper and Cuprous Oxide, 507
Tager, J. M.: Storage of Plant Mitochondria, 932
Takamine, Jokichi (1854–1922), 861
Takemori, Dr. N., and others: Destruction of Tumour Cells by Rift Valley Fever Virus, 698
Talalay, Pamela Samuels: Glutathione Breakdown and Transpeptidation Reactions in *Proteus vulgaris*, 516
Talpa europaea: Occurrence of *Haplosporangium parvum* in the Lungs of the Mole (Dr. A. McDiarmid and P. K. C. Austwick), 843
Tanganyika (Lake): A Curious Ecological 'Niche' among the Fishes of (Dr. Marlier and N. Leleup), 935
Tape for Microsectioning of Very Large, Hard or Brittle Specimens (Prof. Axel Palmgren), 46
Tapley, J. G., and others: Paramagnetic Resonance in Carbonaceous Solids, 797
Tárnoky, Dr. A. L., and White, Dr. P.: Thyroid Function, 826
Task before Us (Dr. P. W. Bridgman), 299
Tasker, H. S.: Elected a Fellow of the Institute of Metals, 589
Taxidermy: Training in (British Museum (Natural History), and the Royal Scottish Museum), 66
Taxonomy (Mosquito): Paper Chromatography as a Tool for—The *Culex pipiens* Complex (Dr. Don W. Micks), 217
Tayler, J. L.: Awarded a Research Studentship in Chemistry by British Celanese, Ltd., 681
Taylor, Angela E. R. (Fox, Prof. H. Munro, and): Injurious Effect of Air-saturated Water on certain Invertebrates, 312
Taylor, D. A., and others: Free Nerve Endings as Transducers of Thermal Stimuli, 918
Taylor, Dr. E. Windle: Biological Evaluation of Water and Effluents, 1042
Taylor, F. H. (Davies, Dr. J. T., and): A Model System for the Olfactory Membrane, 693
Taylor, Sir Geoffrey: Diffusion and Mass Transport in Tubes (Guthrie Lecture of the Physical Society), 113
Taylor, G. W. C.: Promoted to Senior Principal Scientific Officer in the Scientific Civil Service, 1000; work of, 1000
Taylor, J. B.: Appointed agricultural officer, Nigeria, 492
Taylor, L. R., and Kalmus, Dr. H.: Dawn and Dusk Flight of *Drosophila subobscura* Collin, 221
Taylor, L. W.: Molecular Spectroscopy, 1165
Taylor, Dr. Monica: Variation of the Shells of *Murex tribulus* from the Great Bitter Lake, Egypt, 1111
Taylor, N. F., and Kent, Dr. P. W.: Synthesis of (±) Methyl Fluoromalate, 401
Taylor, R. J. (Chapman, Dr. D., and): Infra-Red Assignments of Unsaturation in the Region 900–1,000 cm.$^{-1}$, 1011
Taylor, Dr. T. H. C.: Problems in Applied Zoology, 768
Tchan, Y. T., and Bunt, J. S.: Direct Microscopy for Study and Count of Soil Protozoa, 656
Te Rangi Hiroa (Peter H. Buck): Explorers of the Pacific—European and American Discoveries in Polynesia, *review* by J. N. L. Baker, 287
Tea: Morphological Basis of Quality in (Dr. T. Eden), 844
Teacher in the Twentieth Century (Ronald Gould), 444
Teachers of Geography: Second International Conference of, 633
Tebb, G., and Thoday, Dr. J. M.: Stability in Development and Relational Balance of X-Chromosomes in *Drosophila melanogaster*, 1109
Technical Applications of Photography: The Scientific and (Scientific and Technical Group of the Royal Photographic Society Conference on), 432
Technical Books: Recent Scientific and, Supp. viii, July 31; Supp. viii, August 28; Supp. viii, September 25; Supp. viii, October 30; Supp. viii, November 27; Supp. vi, December 25
Technical Bulletins on Rubber Research: New (British Rubber Producers Research Association), 296
Technical Colleges: Applied Research in (London and Home Counties Regional Advisory Council for Higher Technological Education, Publication No. 18), 913
Technical Colleges and Industry, 371; (Federation of British Industries Conference on), 210
Technical Education in Britain: Technological and, 325
Technical Graduates in the British Armed Services, 1131
Technical Information Services Officers, National: First Meeting of, 677
Technical Institutions, Association of Principals of, and the Association of Technical Institutions: Report on the Development of Higher Technological Education, 325
Technical Publishing Society, Los Angeles: Organization of, 864
Technical Writing: Awards for (Radio Industry Council), 681
Technical and Scientific Civil Servants: Professional, 387
Technion, Haifa, and others: Scientific Convocation in celebration of the seventy-fifth birthday of Prof. Albert Einstein, 591
Technological Education: Higher (Parliamentary and Scientific Committee Memorandum on), 372
Technological Education: Higher, in Great Britain (R. A. Butler), 111
Technological Education: Higher, in Great Britain, 251
Technological Education (Higher): Report on the Development of (Association of Principals of Technical Institutions and Association of Technical Institutions), 325
Technological Education (Higher), London and Home Counties Regional Advisory Council for: Publication No. 18, Applied Research in Technical Colleges, 913
Technological Studies: The Future for, 349
Technological and Technical Education in Britain, 325
Technology: Yeast (John White), *review* by Dr. E. Barton-Wright, 852
Technology and Architecture: Scholarships in Science, (Massachusetts Institute of Technology), 1040
Teleonics (Communications), Ltd.: Correction of Telephone Number, 955
Television (Colour): Bibliography of (Mrs. K. Bourton), 588
Television Receiver Design, Monograph 1, I.F. Stages (A. G. W. Uitjens), *review* by Dr. R. L. Smith-Rose, 99; Monograph 2, Flywheel Synchronization of Saw-Tooth Generators (P. A. Neeteson), *review* by Dr. R. L. Smith-Rose, 99
Television Receiver Design: Valves and, *review* by Dr. R. L. Smith-Rose, 99
Television Receiver Valves: Data and Circuits of (J. Jager), *review* by Dr. R. L. Smith-Rose, 99
Television Society: Bibliography of Colour Television (Mrs. K. Bourton), 588
Tellurite Glasses: Dielectric Properties of (J. Ph. Poley), 268
Tempany, Sir Harold: Methods of Land-Clearance for Agriculture, 69
Temperature: Effect of, on the Inactivation of Phage labelled with Phosphorus-32 (C. Castagnoli and F. Graziosi), 599
Temperature (Air): Newly Fallen Snow and (Prof. Mario Bossolasco), 362
Temperature of Polymethyl Methacrylate at Ultrasonic Frequencies: Transition (P. Hatfield), 1186
Temperature Surveys of a Coke Oven: Heats of Reaction during Carbonization as deduced from (D. J. Millard), 1099
Temperatures (High): Improvements in Vapour-phase Chromatography at Relatively (F. R. Cropper and A. Heywood), 1063
Temperatures (Low): Properties of Materials at (International Institute of Refrigeration, Bulletin Annexe 1954–2), 297
Temperatures of Polymers at Ultrasonic Frequencies: Transition (M. Krishnamurthi and G. Sivarama Sastry), 132
Temperley, H. N. V.: Properties of Matter, *review* by G. R. Noakes, 1120
Temple, Prof. G.: Relaxation in Physics and Engineering, *review*, 714
Templeman, Dr. W. G.: Plant Growth-regulating Substances, 767
  Weed Control, 1177
Temporal and Auditory Judgments: Interdependence of (Prof. John Cohen, C. E. M. Hansel and J. D. Sylvester), 642
Ten-Tola Primary Standard Weight for Karachi Mint, Pakistan (L. Oertling, Ltd.), 296
  Manufacture of the (Dr. G. F. Hodsman), 1094
Tenniswood, Prof. C. R. S.: *Obituary* by Dr. Ralph F. Naylor, 536
'Tensilon': Inability of Acetylcholine Antagonists to protect Mice against the Toxicity of (M. W. Parkes and P. Sacra), 969
Tensor Analysis: Vector and (Prof. G. E. Hay), *review* by S. Austen Stigant, 1119
Terminology used in Absorption Spectroscopy: Symbols and (P. W. D. Mitchell), 591
Terrestrial Climate: A Climatological and Astronomical Interpretation of the Ice Ages and of the Past Variations of (Dr. E. J. Öpik), 172
Terrestrial Heteroptera (Geocorisae): Classification of the (Dennis Leston, J. G. Pendergrast and T. R. E. Southwood), 91
Terrey, Prof. H.: Retirement from a University of London chair of chemistry at University College, 64
Tertiary Foraminifera of the Qatar Peninsula: Lower (Dr. Alan Hilder Smout), *review*, 945
'Terylene': Pile Irradiation of Polyethylene Terephthalate (Miss Audrey Todd), 613
Test Animal in evaluating Artificial Human Milk for Infants: The Rat as a (Prof. Paavo Roine, Helge Gyllenberg, Marjatta Rossander and Ritva Vuokila), 519
Tetrads Segregating for a Lethal or other Epistatic Factor: Analysis of Unordered (Dr. H. L. K. Whitehouse), 463
Tevendale, W. B.: Appointed senior geologist, Geological Survey Department, Gold Coast, 209
Textile Institute: Conference on Fibre Friction, 113
  Institute Medal awarded to Sir Ernest Goodale, 636
  Warner Memorial Medal awarded to R. Meredith, 636
  Honorary Fellowship awarded to J. R. Whinfield, 998
Texture of Metals: Structure and (X-Ray Analysis Group of the Institute of Physics Conference on), 298
Thacker, D. M. D.: Protecting Cleaned Iron Objects, 431
Thain, Dr. E. M.: Awarded a United States Fellowship by the National Academy of Sciences, Washington, for research at the University of California, 164
Thames River Water: Determination of the Absolute Concentration of Deuterium in (G. Clarke, W. H. Denton and P. Reynolds), 469
Theander, Dr. O.: Appointed to a Research Fellowship in chemistry at the University of Birmingham, 1132
Theories of Causation: Bertrand Russell's (Erik Götlund), *review* by F. I. G. Rawlins, 54
Theory: Ideal (Prof. D. G. Northcott), *review* by Dr. L. S. Goddard, 7
Theory of Elasticity: A Landmark in the, *review* by Prof. R. Hill, 713
Theory of Social Change, *review* by Prof. S. E. Finer, 423
Theory of Superconductivity (M. von Laue), translated by Lothar Meyer and William Band, *review* by Dr. A. B. Pippard, 376
Theory of Synthetic Polymers, *review* by Prof. H. W. Melville, 52
Therapy of Paraoxon Poisoning: Pentamethonium as an Adjuvant to Atropine in the (C. A. de Candole and M. K. McPhail), 552

Thermal Analysis (Differential) : Comparative Performance of Nickel and Porous Alumina Sample Holders for (T. L. Webb), 686 , (Dr. Robert C. Mackenzie), 688
Thermal Decomposition of Ethyl Nitrite : Effect of Nitrogen Dioxide on the (Dr. F H. Pollard, A. E. Pedler and C. J. Hardy), 979
Thermal Energy of Radiation : Callendar's 'Radio-Balance' for Determining the (W. B. Mann), 634
Thermal Expansion of Grey Tin (Dr. J. Thewlis and A. R. Davey), 1011
Thermal Reactions of Kenya Cattle vaccinated with Lapinized Rinderpest Virus (G. R. Scott), 44
Thermal Stimuli : Free Nerve Endings as Transducers of (H. J. V. Tyrrell, D. A. Taylor and C. M. Williams), 918
Thermal Studies X-Ray and Differential, of some Indian Montmorillonites (A. K. Bose and Purnima Sengupta), 40
Thermionic Cathode : New Forms of (Institute of Physics and the Physical Society Colloquium on), 1176
Thermionic Valve · Jubilee of the application by Sir Ambrose Fleming for the British patent of the, 386
  Conversazione and Exhibition in the Electrical Engineering Department, University College, London, in connexion with the celebration of the invention by Sir Ambrose Fleming of the, 681
  The Jubilee of the (Dr. R. L Smith-Rose), 1076
Thermionic Valves (A. H. W. Beck), *review* by Dr. L. Jacob, 480
Thermodynamic Properties of Hydrocarbons and related Compounds : Selected Values of Physical and—Comprising the Tables of the American Petroleum Institute Project 44 (Prof. Frederick D. Rossini, Prof. Kenneth S. Pitzer, Raymond L. Arnett, Rita M. Braun and Prof. George C. Pimentel), *review* by H. B. Milner, 54
Thermodynamics, the Kinetic Theory of Gases, and Statistical Mechanics : An Introduction to (Prof. Francis Weston Sears), second edition, *review* by R. W. Haywood, 240
Thermodynamics of the Two-Fluid Model of Liquid Helium II (J. W. Herivel), 322
Thermoelectric Power and the Bauschinger Effect (R. L. Woolley), 566
Thermogravimetry : Differential (Prof. L. Erdey, F. Paulik and J. Paulik), 885
Theses for Cambridge Research Degrees : Abstracts of, 1039
Thewlis, Dr. J., and Davey, A. R. : Thermal Expansion of Grey Tin, 1011
Thiamine Phosphoric Esters : Cocarboxylasic Activity of (Gertrudis de la Fuente and R. Diaz-Cadavieco), 1014
Thiazoles (Mercurated) · Use of, as Fungistatic Agents (Dr. M. K. Rout, B. Padhi and N. K. Das), 516
Things : Sex and the Nature of (Dr. N. J. Berrill), *review* by Dr. Clifford Allen, 763
Thinking : Recent Studies in the Psychology of (Prof. L. S. Hearnshaw), 443
Thirgood, J. V. : Appointed sylviculturist, Forest Department, Cyprus, 209
Thirteenth to the Nineteenth Century : Scientific Instruments from the, 775
Thoday, Dr. J. M. (Tebb, G., and) : Stability in Development and Relational Balance of X-Chromosomes in *Drosophila melanogaster*, 1109
Thomas, E. : Biological, Physical and Chemical Characteristics of the Profundal Zone of Lakes, 1136
Thomas, G., and Eden, A. : A Peculiar Nutritional Dermatitis in Pigs, 553
Thomas, Dr. H. A. : How Science Helps to Clothe Us, 1040
Thomas, Dr. H. Hamshaw : The Species Concept in relation to the British Flora, 246
  The History of Science in Modern Education, 481
Thomas, Dr. I. Estimation of Losses from Pests, 541
  Appointed a member of the Myxomatosis Advisory Committee, 1132
Thomas, Dr. L. C. (Davies, Dr. D. R., and) : Chemistry in relation to the Development of the Nervous System, 456
Thomas, Dr. L. F. (Sheridan, Dr. J., and) : Microwave Spectrum of Methyl-Cyanoacetylene, 798
Thomas, Sir Miles : The Changing Pattern of British Industrial Management, 1088
Thomas, Mrs. Patricia M. : Given an award under the Royal Society and Nuffield Foundation Commonwealth Bursaries Scheme, 8
Thomas, S. B. : Elected president of the Society for Applied Bacteriology, 164
  Bacteriology of Milk and Milk Products, 1135
Thomlinson, J., and others : The Flavour of Porridge, 458
Thompson, A. B. (Marshall, I., and) : Chemistry and Physics of Synthetic Fibres, 117
Thompson, Dr. Alexander John . Logarithmetica Britannica, being a Standard Table of Logarithms to Twenty Decimal Places of the Numbers 10,000 to 100,000, *review* by Dr. J. C. P. Miller, 1028
Thompson, Prof. F. C. : Physical Chemistry of Metals, *review*, 624
Thompson, G. H. . Animal Populations and Forestry, 813
Thompson, Dr. H.· Retirement as Chief of the Division of Fisheries of the Commonwealth Scientific and Industrial Research Organization, 1085 ; work of, 1085
Thompson, Dr. H. W. : Molecular Spectroscopy, 1165
Thompson, R. W. : The *O* Chromosomes and the Distribution of the Dental Fricatives in Europe, 1095
Thompson, Dr. S. Y. : Given an award under the Royal Society and Nuffield Foundation Commonwealth Bursaries Scheme, to visit the Dairy Research Institute, Palmerston North, 164
Thompson, W.: Awarded a scholarship in agricultural economics (farm management) by the Ministry of Agriculture of Northern Ireland, 821
Thompson, Dr. W. R. : Attempts to control two Scale Insects accidentally imported from Bermuda, 541
Thomson, Sir A Landsborough : Appointed chairman of the Advisory Committee on the Protection of Birds for England and Wales, 1086
  Birds of West Africa, *review*, 5
  British Birds, *review*, 327
Thomson, A. P. D., and others : Effect of Cervical Sympathectomy on the Onset of Œstrus in Ferrets, 311
Thomson, Dr. J. · Developments in Thermionic Devices since 1939, 1077
Thomson, Dr. L. C. : Principles of the Measurement of Colour, *review*, 666
Thomson, W. : To receive an award under the Commonwealth Bursaries Scheme of the Royal Society and Nuffield Foundation, 1086
Thorburn, R., and others : New Synthetic Antispasmodics, 231
Thorndike, Alan M. Mesons, a Summary of Experimental Facts, *review* by Dr. G. D. Rochester, 97
Thorne, G. N. . Absorption by Leaves from Nutrient Sprays, 111
Thornton, K. R. · Appointed a lecturer in pathology at the University of Birmingham, 1132
Thorold, C. A. : Use of Ultra-violet Fluorescent Substances for Observations on Dispersal of *Phytophthora palmivora* Sporangia, 409
Thorp, Prof. R. H., and others : New Synthetic Antispasmodics, 231
Thorpe, Dr. W. H. : Some Concepts of Ethology, 101
  Animal Behaviour, 859
  Life and Senses of the Honey Bee, *review*, 897
Thromboplastin Generation Test : A Brain Extract as a Substitute for Platelet Suspensions in the (Dr. W. N. Bell and H. G. Alton), 880
Thunderstorms and Sporadic *E* Ionization of the Ionosphere (Prof. S. K. Mitra and M. R. Kundu), 798
Thyroid Function (Association of Clinical Biochemists and the Association of Clinical Pathologists Joint Meeting on), 826
Thyroid Gland of the White Rat . Cell Activity and Deoxyribonucleic Acid Content of the Nuclei of the (H. Roels), 514
Thyroxine Effect of, on Sexual Behaviour in the Ewe (F. M. Labben), 933
  Galactopoietic Action of, in Cattle kept in Subtropical Countries (Prof. M. Maqsood), 185
l-Thyroxine and Tri-iodo-thyronine in Sheep : Augmentation of Wool-growth by (D. S. Hart), 1018
Tibbitts, Clark : Social and Individual Significance of Ageing, 682
Tickner, Dr. A. : Thyroid Function, 826
'Tiger Cat' : The Marsupial (Ellis Troughton), 163
Tilley, J. M. A., and others · Nutritive Value of Lucerne Protein Concentrates, fed with and without Cholesterol, 227
Tillotson, Ernest Microseisms, 302
Time Comparisons by means of Radio Transmissions : World-wide Frequency and (J. A. Pierce, H. T. Mitchell and Dr. L. Essen), 922
Time Counts, the Story of the Calendar (Harold Watkins), *review* by H. S. J., 945
Timmermans, J. · Odour and Chemical Constitution, 235
Tin (Grey) : Formation of Compact Pieces of (L. J. Groen), 836
  Formation of Plates of (L. J. Groen and W. G. Burgers), 587
  Thermal Expansion of (Dr. J. Thewlis and A. R. Davey), 1011
Tin Research Council, International : Appointment of Dr. Ernest S. Hedges as director, 1172
  Appointment of Dr. W. E. Hoare and W. R. Lewis as assistant directors, 1172
Tin Research Institute : Establishment of a Fellowship at University College, London, and appointment of R. H. Prince as first holder, 864
  Appointment of Dr. Ernest S. Hedges as director, 1172
  Appointment of Dr. W. E. Hoare and W. R. Lewis as assistant directors, 1172
Tinbergen, Dr. N. : Animal Behaviour, 857
Tinsley, T. W., and Usher, G. · A Colour Test for detecting Swollen Shoot Disease in Gold Coast Cacao, 87
Tipula paludosa : A Second Virus Disease of the Leatherjacket (N. Xeros), 562
Tissières, Dr. A. Role of High-molecular Weight Components in the Respiratory Activity of Cell-free Extracts of *Aerobacter aerogenes*, 183
Tissue Culture, *review* by Dr. Honor B. Fell, 809
Tissue Culture : A Bibliography of the Research in, 1884 to 1950 (prepared by Margaret R. Murray and Gertrude Kopech), *review*, 576
  Effect of Œstrogen and of Vitamin A on Vaginal Cornification in (Raymond H. Kahn), 317
  Interference and Cell Protection by Poliomyelitis Virus in (Dr. G. L. Le Bouvier), 649
Tissue Extract (Plant) · Synthesis of Sucrose by a Partially Purified (Dr. J. F. Turner), 692
Tissue Histamine : Chromatography of (Dr. G. B. West and Dr. J. F. Riley), 882
Tissues (Human Blood and) : Progesterone in (Josef Zander), 406
Tissues (Insect) : Culture of (T. D. C. Grace), 187
Tissues (Living and Dead) : Measurement of Electrode Potentials in (Dr. D. B. Cater and Dr. A. F. Phillips), 121
Tissues (Plant) . Mechanical Separation of (C. G. Jarman), 890
Titanium Carbide : Titanium Nitride and, as Semiconductors (Prof. A. Münster, K. Sagel and G. Schlamp), 1154
Titanium-Chromium Alloy Transformation in a (Dr. H. M. Otte), 506
Titanium Dioxide for Ceramic Capacitors : Low-temperature Sintering of (T. V. Ramamurti, C. V. Ganapathy and Shiv Saran), 1187
Titanium Nitride and Titanium Carbide as Semiconductors (Prof. A. Munster, K. Sagel and G. Schlamp), 1154
Tizard, R H. : Appointed officer-in-charge of the new Control Mechanisms and Electronics Division of the National Physical Laboratory, 110
Toadstools Mushrooms and, a Study of the Activities of Fungi (Dr. John Ramsbottom), *review* by Prof. Ronald Good, 197
Tobacco Leaves · Synthesis of Sucrose by (P. V. Vittorio, G. Krotkov and G. B. Reed), 1038
Tobacco Mosaic Virus : Radioactive (F. L. Wynd), 297
  Rapid Extraction of Intact Crystalline Inclusions from the Cells of Plants infected with (Dr. Miguel Rubio Huertos), 313
Tobacco Research Board of Southern Rhodesia—New Headquarters Station at Kutsaga (Dr. F. A. Stinson), 25
Todd, Sir Alexander : Complex Natural Colouring Matters, 990
Todd, Sir Alexander, and others· Structure of Vitamin B_{12}—A Crystalline Nucleotide-free Degradation Product of Vitamin B_{12}, 1168
Todd, Miss Audrey · Pile Irradiation of Polyethylene Terephthalate ('Terylene'), 613
Todd, Prof. Wilbert R. (West, Prof. Edward Staunton, and) : Textbook of Biochemistry, *review* by Dr. H. N. Munro, 479
Todrick, Dr. A. . Chemistry in relation to the Development of the Nervous System, 456
Tol, Dr. T., and Oosterkamp, Dr. W. J · Visibility of X-Ray Quantum Fluctuations on Image Intensifier Radiographs, 397
Tola (Ten-) Primary Standard Weight for Karachi Mint, Pakistan (L. Oertling, Ltd.), 296
  Manufacture of the (Dr. G. F. Hodsman), 1094

Tolerance to Ganglion Blockade by Methonium Compounds: Development of (Dr. J. K. Mohanty), 184
Tolerance to the Maize Rust *Puccinia polysora* Underw. (R. T. Ellis), 1021
1-(2-Tolylazo)-2-naphthol (Oil Orange *TX*): Induction of Tumours with (Dr. G. M. Bonser, Dr. D. B. Clayson and Dr. J. W. Jull), 879
Tomato Plants grown in Sand Culture: Relation of Nitrogen Supply to the Molybdenum Requirement of (Dr. E. J. Hewitt and Dr. C. C. McCready), 186
Tomato Roots (Excised): Norvaline, a Growth Factor for (William G. Boll), 517
Tomato Seed: Internal Infection of, by *Didymella lycopersici* Kleb. (Dorothy E. Fisher), 656
Tomkeieff, Dr. S. I.: A New Periodic Table of the Elements based on the Structure of the Atom, *review* by Prof. F. A. Paneth, 420
  Obituary of Prof. H. G. A. Hickling, 486
Tomlinson, Dr. J. A. (Aitkenhead, P., and): Diseases and Pests on Horticultural Planting Material, 163
Tool for Mosquito Taxonomy: Paper Chromatography as a—The *Culex pipiens* Complex (Dr. Don W. Micks), 217
Tooth, Miss B. E. (Dresel, Dr. E. I. B., and): Solubility of Uroporphyrin I in Ethyl Acetate, 271
Topper, B. F.: Appointed a senior agricultural officer, Jamaica, 209
Torquay Natural History Society, 634
Totton, A. K.: Egg-laying in Ctenophora, 360
  Siphonophora of the Indian Ocean, 501
Towers, G. H. N., and Mortimer, D. C.: Identification of an Artefact on Chromatograms of the Keto-acid 2,4-Dinitrophenyl-hydrazones, 1189
Townend, Dr. D. T. A.: New Education Scheme of the Institute of Fuel, 489
Townsend, A. C.: *Obituary* of A. de C. Sowerby, 723
Townsend, Dr. G. W. H.: Social and Individual Significance of Ageing, 683
Townsend, Jonathan, and others: Free Radicals in Biological Materials, 689
Toxic Effect of Fluoride (L. M. Carr), 884
Toxic Fluorine Compounds (Dr. F. L. M. Pattison), 737
Toxicity of Ammonia: Influence of Carbon Dioxide on the (J. S. Alabaster and D. W. M. Herbert), 404
Toxicity of Erythromycin (W. J. Kaipainen and S. Faine), 969
Toxicity of 'Tensilon': Inability of Acetylcholine Antagonists to protect Mice against the (M. W. Parkes and P. Sacra), 969
Toxicity and Narcotic Activity of Fluorocarbons (A. A. Banks, A. Campbell and A. J. Rudge), 885
Toxin (Diphtheria): Detoxification of, with Formaldehyde mixed with an Amino-acid (Carola Neumuller), 405
  Submerged Culture Production of (F. V. Linggood, A. C. Matthews, S. Pinfield, C. G. Pope and T. R. Sharland), 557
Toxopyrimidine Phosphate in the Tyrosine Decarboxylase System: Competitive Inhibition of Pyridoxal Phosphate Action by (Dr. Katashi Makino and Masahiko Koike), 1056
Trace Analysis by X-Ray Emission Spectrography (Henry G. Pfeiffer and Paul D. Zemany), 397
Trade and Finance: Survey of Industry, (Seymour Melman), 350
Trade Marks in India: Registrar of, 339
Traill, R. C.: *Obituary* of Dr. Jean White-Haney, 676
Training in the field of Management: Education and (British Institute of Management Booklet on), 432
Training in Taxidermy (British Museum (Natural History) and the Royal Scottish Museum), 66
Transducers of Thermal Stimuli: Free Nerve Endings as (H. J. V. Tyrrell, D. A. Taylor and C. M. Williams), 918
Transfer of Ova in Sheep: Successful Inter-breed (G. L. Hunter, C. E. Adams and L. E. Rowson), 890
Transformation in a Titanium-Chromium Alloy (Dr. H. M. Otte), 506
Transformers: Electrical Machines and, *review* by R. Neumann, 988
Transition Temperatures of Polymers at Ultrasonic Frequencies (M. Krishnamurthi and G. Sivarama Sastry), 132
Transistor: Alloy Junction Type of, 121
Transistor (Junction): New Advances in the (E. W. Herold), 121
Transition Temperature of Polymethyl Methacrylate at Ultrasonic Frequencies (P. Hatfield), 1186
Translocation of Phosphorus: Mycorrhizal Uptake and (Dr. J. L. Harley and Dr. J. K. Brierley), 776
Transmigration of Unborn Mice (Anne McLaren and Donald Michie), 844
Transpeptidation Reactions in *Proteus vulgaris*: Glutathione Breakdown and (Pamela Samuels Talalay), 516
Transport of Chloride in the 'Symplasm' of *Vallisneria* Leaves (Prof. W. H. Arisz), 223
Transzendentale Phänomenologie: Die Krisis der Europäischen Wissenschaften und die (Edmund Husserl), herausgegeben von Walter Biemel, *review* by F. I. G. Rawlins, 666
Tranter, T. C.: Influence of 'Surface Chilling' on the Detonative Behaviour of Cast Trinitrotoluene, 81
Tranter, T. C. (Evans, W. M., and): 'Reaction Time' of Cast Trinitrotoluene as a Function of the Rate of Charge Cooling, 1100
Trapped Atoms and Radicals in a Glass 'Cage' (Dr. Irwin Norman and Dr. George Porter), 508
Traub, A., and others: Cultivation of *Pasteurella tularensis* in Chemically Defined Media—Effect of Buffers and Spermine, 747
Travel of Sea Waves: Finding the Direction of (N. F. Barber), 1048
Travel Grants under the Fulbright Programme, 1040
Treasury Grant, Academic Year 1952–53; Returns from Universities and University Colleges in receipt of (University Grants Committee), 165
Treatment of Leukopenia caused by Irradiation: Alkoxyglycerols in the (Astrid Brohult and John Holmberg), 1102
Tree Growth on Acid Soil, 855
Tree Shrew: Breeding of the (J. R. Hendrickson), 794
Trees (Forest): The Interactions between Acid Soils and (British Association for the Advancement of Science, Sections K (Botany) and K* (Forestry), Symposium on), 855
Treloar, Dr. L. R. G.: Annual Report on the Progress of Rubber Technology, *review*, 54
  Chemistry and Physics of Synthetic Fibres, 117
Tri-iodo-thyronine in Sheep: Augmentation of Wool-growth by l-Thyroxine and (D. S. Hart), 1018
Tricalcium Phosphate in Bone: Isotopic Exchanges and the Existence of (Dr. J. Govaerts), 831
Trichostrongyle Infective Larvae in 'Monobacterial' Culture: Size of (P. A. G. Wilson), 520
Trifluoroacetic Acid as a Solvent for Proteins: Anhydrous (Joseph H. Katz), 509
Trifolium repens L.: Gene Frequencies in Strains of (H. Daday), 521
Trinitrotoluene (Cast): Influence of 'Surface Chilling' on the Detonative Behaviour of (T. C. Tranter), 81
  'Reaction Time' of, as a Function of the Rate of Charge Cooling (W. M. Evans and T. C. Tranter), 1100
Triploid Dactylorchid Hybrids: Cytology of (Prof. J. Heslop-Harrison), 112
Triploidy (Spontaneous): Independence of Delayed Fertilization and, in Mouse Embryos (A. H. Gates and Dr. R. A. Beatty), 356
Tristram, H., and others: Hydrolysis of Methylglucosides, 560
Tritium-labelled Substances: Assay of—a 'Combustion Bomb' Method of Preparation of Gas for Counting (P. R. Payne and J. Done), 27
Trombiculid Mites in the Field: A Method of Rearing Individual (Dr. J. R. Audy and M. Nadchatram), 1021
Tropical Black Earth: *in vitro* Production of (Dr. D. G. Hessayon and R. G. Hutton), 612
Tropical Soils: The Immobilization of Mineral Nutrients in (W. V. Bartholomew, J. Meyer and H. Laudelout), 23
Tropical and Sub-Tropical Climates: Breeding for Beef in (D. M. Joubert), 915
Troughton, Ellis: The Marsupial 'Tiger Cat', 163
Trout, *Salmo trutta* L. (Loch): Spawning Migration, Reproduction and Young Stages of (T. A. Stuart), 342
Trucco, Dr. Raul E.: Exchange of ^{14}C-Glucose-1-phosphate with Uridine-diphosphate-glucose by the Galacto-Waldenase System, 1103
Trueman, Sir Arthur (edited by): The Coalfields of Great Britain, *review* by Dr. J. E. Richey, 418
Truswell, J. F.: Appointed geologist, Nigeria, 344
Trytten, M. H.: Awarded a special citation by the American Association of Physics Teachers for noteworthy service, 915
Tsetse Control, Department of, Gold Coast: Appointment of B. H. Wyatt as research assistant, 864
Tsuchida, Ryutaro, and Yamada, Dr. Shoichiro: Interaction between Metal Ions through Anions, 1064
Tsuzuki, Prof. Yojiro, and Mori, Nobuo: Sweetness and Configuration in Rhamnose, 458
Tubes: Diffusion and Mass Transport in (Sir Geoffrey Taylor), 113

Tutin, Prof. T. G.: The Species Concept in relation to the British Flora, 245
Tutin, Mrs. W.: Biological, Physical and Chemical Characteristics of the Profundal Zone of Lakes, 1136
Twentieth Century: The Teacher in the (Ronald Gould), 444
Twilight Movements of a Sonic Scattering Layer: Submarine Illumination and the (Elizabeth M. Kampa and Brian P. Boden), 869
Two-Fluid Model of Liquid Helium II: Thermodynamics of the (J. W. Herivel), 322
Types of Diamond: The Problem of the Two (Prof. G. B. B. M. Sutherland, B. E. Blackwell and W. G. Simeral), 901
Tyrosine Decarboxylase System: Competitive Inhibition of Pyridoxal Phosphate Action by Toxopyrimidine Phosphate in the (Dr. Katashi Makino and Masahiko Koike), 1056
Tyrrell, H. J. V., and others: Free Nerve Endings as Transducers of Thermal Stimuli, 918

UBBELOHDE, Prof. A. R.: Cataphoresis of Crystal Nuclei, 269
Ubiquitous Aldehyde: The, *review* by Dr. J. Idris Jones, 1163
Ucelli, Guido: Programma e idealità del Museo Nazionale della Scienza e della Tecnica 'Leonardo da Vinci', *review*, 152

Uchikoshi, Hajime (Hagihara, Hitosi, and) · Adsorption of Alkyl Xanthate and Dithiophosphate on a Cleavage Face of Galena as revealed by Electron Diffraction, 80
Udder (Lactating Goat) : Synthetic Activity of a Single Epithelial Cell of the (K. C. Richardson and Dr. S. J. Folley), 828
Uebersfeld, J., and others : Paramagnetic Resonance, a New Property of Coal-like Materials, 614
Uitjens, A. G. W. . Television Receiver Design, Monograph 1, I.F. Stages, *review* by Dr. R. L. Smith-Rose, 99
Ultrasonic Absorption in Castor Oil, Carbon Disulphide, Benzene and Xylene (Prof. A. K. Dutta and K. Samal), 976
Ultrasonic Frequencies : Transition Temperatures of Polymers at (M. Krishnamurthi and G. Sivarama Sastry), 132
  Transition Temperature of Polymethyl Methacrylate at (P. Hatfield), 1186
Ultra-violet Absorption Spectra of Proteins in the Solid State : Infra-red and (Elton S. Cook, Cornelius W. Kreke, Edward B. Barnes and Werner Motzel), 1144
Ultra-violet Fluorescent Substances · Use of, for Observations on Dispersal of *Phytophthora palmivora* Sporangia (C. A. Thorold), 409
Ultra-Violet Light : Indirect Effect of, on Skin Blood Vessels (M. W. Partington), 134
Unbiased Ratio Estimators (Prof. H. O. Hartley and Dr. A. Ross), 270
Unborn Mice : Transmigration of (Anne McLaren and Donald Michie), 844
Underwood, Eric H. · Appointed director of public relations to the United Kingdom Atomic Energy Authority, 1172 ; work of, 1172
Unesco : Seventh Session of the Advisory Committee on Arid Zone Research, 115
  Directory of International Scientific Organizations, 489
Unesco (International Union of Pure and Applied Physics and) : Conference on Nuclear and Meson Physics, 530
Unesco, and others · Report on International Definition and Measurement of Standards and Levels of Living, 350
Unesco Arid Zone Programme . Reviews of Research on Problems of Utilization of Saline Water, 782
Unesco Middle East Science Co-operation Office (Lebanese Society of the Friends of the Trees and) : Conference on the Conservation of Nature in the Near and Middle East, 288
Unesco Science Co-operation Office for Latin America . Scientific Institutions and Scientists in Latin America, 1, Costa Rica, El Salvador, Guatemala, Honduras, Nicaragua and Panama, 430
  Discussion on an International Network of Marine Biological Laboratories in Latin America, 1002
Unilever, Ltd : Grant of £200 a year for seven years to the University of Birmingham, towards expenses of the Institute of Engineering Production, 1132
United Kingdom Atomic Energy Authority, 18
  Appointment of members, 64
  Heavy-Water Reactor (Dimple) at Harwell, 251
  Appointment of W. R. J. Cook as deputy director of the Atomic Weapons Research Establishment, Aldermaston, 344
  Appointment of Eric H. Underwood as director of public relations, 1172
  Appointment of Stanley White as press officer, 1172
United Nations : Annual Report of the Secretary-General on the Work of the Organization for 1953–54, 1002
United Nations, and others : Report on International Definition and Measurement of Standards and Levels of Living, 350
United Nations Economic and Social Council . Report on the Development and Utilization of Water Resources, 213
United Nations Technical Assistance Committee : Sixth Report of the Technical Assistance Board (1953), 960
United States . Basic Scientific Research and Public Policy in the, 70
  Industrial Research and Development in the, 26
  Registration of Chemists and Engineers in the, 65
  Survey of Scientific Journals in the (R. Tombleson and Helen L. Brownson), 341
United States Air Force (Geophysical Research Division), (Office of Naval Research and) · Symposium on Microseisms, 302
United States Atomic Energy Commission : Stanford Research Institute, California, named as a depository of unclassified information on atomic energy, 341
United States Department of Agriculture . Booklet on the Work of Professional Entomologists, 253
United States Department of Labor : Bulletin No. 1148 of the Bureau of Labor Statistics, Scientific Research and Development in American Industry, 26
United States National Bureau of Standards : Handbook 55, Protection against Betatron and Synchrotron Radiations up to 100 million Electron Volts, 340
  Circular 523, Energy Transfer in Hot Gases, 383
United States National Museum · Annual Report for 1952–53, 385
United States Research Fellowships for British Scientists, 164, 1173
United States Unclassified Information on Atomic Energy, 341
Units : The M.K.S. System of (T. McGreevy), *review* by G. R. Noakes, 527
Universities : Science in the Extra-Mural Work of (Prof. Robert Peers), 166
Universities (South African) : Register of Current Scientific Research at (Council for Scientific and Industrial Research, Pretoria), 429
Universities of the Commonwealth · Report of Proceedings of the Seventh Congress of the, 1953 (edited by Dr. J. F. Foster), *review*, 331
Universities and the Community, 1025
Universities and University Colleges in receipt of Treasury Grant, Academic Year 1952–53 : Returns from (University Grants Committee), 165
Universities Federation for Animal Welfare : Summer School at Knuston Hall, 67
Universities Federation for Animal Welfare, in association with the Animal Welfare Institute of New York : Appointment of Dr. W. M. S. Russell as research fellow to study humane vivisection, 488
University of Aberdeen : Appointment of Dr. G. M. Burnett to the chair of chemistry, 953
University of Birmingham . Conference on Mechanical Effects of Dislocations in Crystals, 377
  Appointment of Dr. C. A. Rogers to the Mason chair of pure mathematics, 820, 953
  Appointment of Dr. J. D. Lawson as lecturer in geology, 820
  Appointment of Dr. J. N. Pratt as lecturer in physical metallurgy, 820
  Appointment of M. G. Cockcroft as lecturer in industrial metallurgy, 820
  Appointment of F. Benson as lecturer in engineering production, 820
  Appointment of Dr. A. Kelly as I.C.I. Fellow in industrial metallurgy, 820
  Retirement of Dr. S. R. Carter as lecturer in chemistry, 820
  Resignation of Dr. C. S. Ball as lecturer in industrial metallurgy, 820
  Resignation of Dr. J. H. Cort as lecturer in physiology, 820
  Resignation of Mrs. B. Eckstein as lecturer in geography, 820
  Resignation of H. Grisbrook as lecturer in engineering production, 820
  Resignation of Dr. H. Nuttall as lecturer in mechanical engineering, 820
  Resignation of E. C. Park as Research Fellow in physics, 820
  Resignation of Dr. C. A. Ramm as lecturer in physics, 820
  Resignation of G. K. Williamson as I.C.I. Research Fellow in physics, 820
  Resignation of J. Y. Freeman as Department of Scientific and Industrial Research Research Assistant in physics, 820
  Resignation of R. F. Coe as Department of Scientific and Industrial Research Research Fellow in physics, 820
  Appointment of E. H. Wright as lecturer in mechanical engineering, 1132
  Appointment of Dr. S. A. Barker as lecturer in chemistry, 1132
  Appointment of Dr. K. F. Chackett as lecturer in physics, 1132
  Appointment of C. B. Wright as lecturer in physical metallurgy, 1132
  Appointment of Dr. J. D. Blainey as lecturer in experimental pathology, 1132
  Appointment of J. B. W. Halley and K. R. Thornton as lecturers in pathology, 1132
  Appointment of Dr. N. S. Ross as Harry Payne lecturer in employer–employee relations, 1132
  Appointment of Dr. Jacques Vilain, Dr. P. D. Whitaker and E. A. Finlay to Research Fellowships in physics, 1132
  Appointment of Dr. O. Theander, Dr. A. Sykes, Dr. C. R. Patrick and M. Kapel to Research Fellowships in chemistry, 1132
  Appointment of Dr. E. L. Breese and Dr. F. W. Allard to Research Fellowships in genetics, 1132
  Appointment of J. R. Coope to a Research Fellowship in geology, 1132
  Appointment of Dr. A. D. Hudson, Dr. Francine Gregoire and Dr. A. L. Woolf to Research Fellowships in pathology, 1132
  Appointment of Dr. P. B. Bradley to a Research Fellowship in experimental psychiatry, 1132
  Appointment of W. A. Coppel to a Research Fellowship in pure mathematics, 1132
  Resignation of Dr. Hilde Behrend as Research Fellow in commerce, 1132
  Resignation of J. S. Howell as Research Fellow in pathology, 1132
  Grant of £1,600 from the National Coal Board for research in the Department of Mining, 1132
  Grant of £200 a year for seven years from Unilever, Ltd., towards expenses of the Institute of Engineering Production, 1132
  Grant of 15,000 dollars from the Rockefeller Foundation to the Department of Chemistry for Prof. M. Stacey's research in biochemistry, 1132
  Research Fellowship in the field of organic chemistry sponsored by the Geigy Company for one year, 1132
  Monograph A.4 of the Research Board, Faculty of Commerce and Social Science, The Financial Effect of Labour Turnover (Dr. Frank T. Pearce), 1180
University of Bristol · Annual Report of the Agricultural and Horticultural Research Station, Long Ashton, for 1953, 954
University of Cambridge . Report of the Observatories Syndicate for 1953, 26
  Retirement of Dr. John Hammond as reader in agricultural physiology, 339
  Abstracts of Theses for Research Degrees, 1039
  Prof. H. Bethe, of Cornell University, to spend the academic year 1955–56 in the Cavendish Laboratory as an adviser on the development of nuclear physics, 1040
University of Cape Town . Offer of a Scholarship to a student from Great Britain, 209
University of Chicago : Postdoctoral Fellowships in Statistics, 777
University of Edinburgh . Appointment of Dr. J. W. Watson to the chair of geography, 295
  Grant of £27,000 from the Nuffield Foundation to build a new rheumatic unit, 909
University of Glasgow : Botany in the—250th Anniversary, 10
  Grant of 7,500 dollars from the Rockefeller Foundation towards the expenses of three Conferences of European Scientists interested in Genetical Problems, 777
  Appointment of Prof. Donald S. Hendrie to the chair of agriculture, 1039
  Appointment of A. C. MacLean as lecturer in geology, 1039
  Appointment of Dr. E. Gelles as lecturer in chemistry, 1039
  Appointment of Dr. H. W. Wilson as lecturer in experimental physics, 1039
  Appointment of Dr. S. C. Abrahams to a senior I.C.I. Fellowship, 1039
  Appointment of Dr. H. M. M. Shearer to an I.C.I. Fellowship, 1039
University of Hull (Prof. Brynmor Jones), 1121
University of Leeds · The First Half-Century (Prof. A. N. Shimmin), *review* by Prof. R. Whiddington, 196
  Division of Man-made Fibres, 206
  Title of reader in physics conferred on Dr. F. E. Hoare, 209
  Appointment of E. W. Bennett as lecturer in the Department of Civil Engineering, 209
  Annual Report of the Librarian for 1952–53, 489

  Eighteenth Annual Report of the Brotherton Collection Committee (1952–53), 489
  Appointment of A. Richardson as lecturer in the Department of Electrical Engineering, 863
  Appointment of Dr. J. H. Robertson as Brotherton lecturer in the Department of Inorganic and Structural Chemistry, 863
  Appointment of Dr. P. Feltham and Dr. R. Shuttleworth as lecturers in metallurgy, 863
  Appointment of D. Payne as lecturer in agricultural chemistry, 863
  Appointment of Dr. D. Dowson as lecturer in the Department of Mechanical Engineering, 863
  Title of emeritus professor of philosophy conferred on Prof. J. W. Harvey, 863
  Title of emeritus professor of social studies conferred on Prof. A. N. Shimmin, 863
  Gift of £3,900 from the Nuffield Foundation to the Department of Botany, for research on the molecular structure of the cell walls of plants, 863
  Gift of £1,000 a year for two years from the Bradford Dyers' Research Association to the Department of Colour Chemistry and Dyeing for a research scholarship, 863
  Gift of a recurrent grant of £800 a year from the Medical Research Council to the Department of Experimental Pathology and Cancer Research, for research into the possible carcinogenic fractions from tobacco tar, 863
  Gift of £3,000 from the Northeastern Division of the National Coal Board to the Department of Mining, renewal of an annual grant, 863
  Gift of £3,475 from the National Coal Board, for special research projects in the Department of Mining, 863
  Gift of £2,000 from the Department of Scientific and Industrial Research to the Department of Psychology, for a research project on the comprehensibility of technical reports, 863
  Gift of £1,100 a year for two years from the Bradford Dyers' Research Association to the Department of Textile Industries, renewal of a grant for a research fellowship, 863
  Gift of £450 a year for seven years from the Dunlop Rubber Co., Ltd., London, to the Department of Textile Industries, for a research scholarship, 863
  Grant not exceeding £10,000 from the Wellcome Trust to the Department of Pharmacology, for the reconstruction and re-equipping of laboratories, 1040
  Gift of £20,000 from Imperial Chemical Industries, Ltd., to the Department of Textile Industries, towards the cost of equipping the new man-made fibres building, 1040
  Appointment of Dr. H. E. Nursten as a lecturer in the Department of Leather Industries, 1040
University of Liverpool: International Symposium on the Comparative Endocrinology of Vertebrates, 543
University of London: Election of Prof. H. R. Robinson as vice-chancellor, 20
  Retirement of Prof. H. Terrey from a University chair of chemistry at University College, 64
  Appointment of Prof. R. S. Nyholm to a University chair of chemistry at University College, 64
  Vacation School on Aircraft Electrical Systems at the Imperial College of Science and Technology, 67, 1001
  Appointment of Prof. R. M. Barrer to the University chair of physical chemistry at the Imperial College of Science and Technology, 112, 205
  Appointment of Dr. C. Domb to the University chair of theoretical physics at King's College, 112, 250
  Appointment of Dr. J. A. C. Knox to the University chair of physiology at Queen Elizabeth College, 112, 205
  Appointment of Dr. D. R. Wilkie to the University readership in experimental physiology at University College, 112
  Appointment of Dr. M. J. Wise to the Sir Ernest Cassel readership in economic geography at the London School of Economics and Political Science, 112
  Retirement of Prof. H. V. A. Briscoe from the directorship of the laboratories for inorganic and physical chemistry, and the University chair of inorganic chemistry, in the Imperial College of Science and Technology, 205
  Title of professor emeritus of inorganic chemistry in the University conferred on Prof. H. V. A. Briscoe, 209
  Title of professor emeritus of zoology in the University conferred on Prof. H. Munro Fox, 209
  Title of professor emeritus of sociology in the University conferred on Prof. Morris Ginsberg, 209
  Title of professor emeritus of mathematics in the University conferred on Prof. Hyman Levy, 209
  Appointment of D. G. MacRae to the University readership in sociology at the London School of Economics and Political Science, 209
  Appointment of Dr. R. G. White to the University readership in bacteriology at the London Hospital Medical College, 209
  Appointment of Dr. J. H. Wilkinson to the University readership in chemical pathology at Westminster Medical School, 209
  Retirement of Prof. H. Levy from the chair of mathematics at the Imperial College of Science and Technology, 295
  Course on the Measurement of the Particle-size Characteristics of Fine Powders to be given by Dr. H. E. Rose in the Faculty of Engineering, King's College, 298
  Appointment of Dr. A. Frohlich to the University readership in pure mathematics at King's College, 299
  Retirement of Prof. H. Munro Fox from the professorship of zoology at Bedford College, 537
  Appointment of Dr. A. Neuberger to a University chair of chemical pathology at St. Mary's Hospital Medical School, 537
  Courses and demonstrations on Photoelasticity at University College, 540
  Conversazione and Exhibition in the Electrical Engineering Department of University College, in connexion with the celebration of the jubilee of the invention of the Thermionic Valve by Sir Ambrose Fleming, 681
  Appointment of Dr. R. H. Sondheimer to the University readership of applied mathematics at Queen Mary College, 727
  Appointment of Dr. Nicol Gross to the University readership in production engineering at the Imperial College of Science and Technology, 777
  Title of University reader in computational methods conferred on Dr. A. D. Booth, 821
  Fellowship established at University College by the Tin Research Institute, 864
  Appointment of Dr. H. J. Eysenck to the University chair of psychology at the Institute of Psychiatry, 955
  Title of professor of biochemistry in the University conferred on Dr. Henry McIlwain, 1040
  Title of reader in physiology in the University conferred on Dr. M. Grace Eggleton, 1040
  Restoration of War-damaged Buildings of University College, 1086
  Appointment of Prof. R. P. Linstead as rector of the Imperial College of Science and Technology, 1130
  Appointment of Prof. R. E. Glover as principal and dean of the Royal Veterinary College, 1132
  Appointment of A. D. Knox to the University readership in economics with special reference to the economics of underdeveloped countries at the London School of Economics and Political Science, 1174
  Title of University reader in economics conferred on Dr. A. W. H. Phillips, 1174
University of London Appointments Board: Forty-third Annual Report (1953), 385
University of London Institute of Psychiatry: Appointment of Dr. H. J. Eysenck to the University chair of psychiatry, 955
  Title of professor of biochemistry in the University conferred on Dr. Henry McIlwain, 1040
University of Malaya: Retirement of Prof. R. E. Holttum from the professorship of botany, 996
University of Manchester: Radio Telescope at Jodrell Bank Experimental Station, 68
  Grant of £70,000 from the Nuffield Foundation to extend the work of the rheumatism centre, 909
University of Oxford: Lectures on General Pathology delivered at the Sir William Dunn School of Pathology (edited by Sir Howard Florey), *review* by Prof. John W. S. Blacklock, 99
  Retirement of Sir Rudolph Peters from the Whitley professorship of biochemistry, 160
  Appointment of Prof. H. A. Krebs as Whitley professor of biochemistry, 160
University of Padua: Offer of a Gabriella Zuccari Scholarship for research at the Zoological Station, Naples, 164
University of Pennsylvania: Veterinary Research in Mexico by the, 954
University of Queensland: Macrossan Memorial Lecture (Sir Ian Clunies-Ross), 1131
University of Reading: Annual Report for 1953 of the National Institute for Research in Dairying, 208
  Appointment of A. N. Duckham to the chair of agriculture, 428
University of St. Andrews: Appointment of Dr. A. D. Walsh to the chair of chemistry at Queen's College, Dundee, 586
University of Sheffield: Appointment of E. J. Sarginson as lecturer in civil engineering, 113
  Appointment of J. R. Metcalf as lecturer in mining, 113
  Retirement of Prof. I. C. F. Statham from the chair of mining, 250
  Appointment of F. S. Atkinson to the chair of mining, 250
  Appointment of Dr. A. Roberts as senior lecturer in the Postgraduate School of Mining, 820
  Appointment of P. B. N. Neal and D. M. Woo as lecturers in mechanical engineering, 820
  Appointment of P. H. Mann as lecturer in social studies, 820
  Resignation of Dr. H. E. Harding as reader in pathology, 820
  Resignation of Dr. R. Shepherd as senior lecturer in the Postgraduate School of Mining, 820
  Resignation of Dr. C. E. Davies as senior lecturer in medicine, 820
  Resignation of B. R. Dudley as lecturer in applied mathematics, 820
  Resignation of Miss C. M. Hamill as lecturer in pure mathematics, 820
  Resignation of F. G. West-Oram as lecturer in glass technology, 820
  Gift by P. Irwin Packington of a cabin cruiser to the Department of Zoology for use in coastal and inland waters, 820
  Grant of £8,000 from the Nuffield Foundation to finance a research fellowship in the Sheffield Centre for the Investigation and Treatment of Rheumatic Diseases, 909
  Title of emeritus professor of mining conferred on Prof. I. C. F. Statham, 1174
University of Stellenbosch: *Welwitschia mirabilis* Hook F. from Seed to Seed in the Botanic Garden of the (H. Herre), 587
University of Utopia, 939
University of Utopia (Robert M. Hutchins), *review* by R. Brightman, 1164
University of the Witwatersrand: Appointment of Prof. A. L. Hales as director of the Bernard Price Institute of Geophysical Research, 428
  Geophysical Conference, 538
University Affairs in Great Britain, 1952–53, 165
University College, Leicester: Retirement of Prof. Patrick W. Bryan from the chair of geography, 17
  Appointment of Norman Pye to the chair of geography, 18
University College, London: Retirement of Prof. H. Terrey from a University of London chair of chemistry, 64
  Appointment of Prof. R. S. Nyholm to a University of London chair of chemistry, 64
  Appointment of Dr. D. R. Wilkie to the University of London readership in experimental physiology, 112
  Courses and demonstrations on Photoelasticity, 540
  Conversazione and Exhibition in connexion with the celebration of the jubilee of the invention of the Thermionic Valve by Sir Ambrose Fleming, 681
  Fellowship established by the Tin Research Institute, 864
  Title of reader in physiology in the University of London conferred on Dr. M. Grace Eggleton, 1040
  Restoration of War-damaged Buildings, 1086

University College of North Staffordshire : Appointment of A. G. N. Flew to the chair of philosophy, 206
University College of North Staffordshire (Institute of Biology and the) : Residential Conference on the Place of Biology in a General University Education, 777
University Colleges in receipt of Treasury Grant, Academic Year 1952–53 Returns from Universities and (University Grants Committee), 165
University Colleges (Colonial) Nuffield Foundation Grant for, 997
University Education : The Place of Biology in a General (Institute of Biology and the University College of North Staffordshire Residential Conference on), 777
University Graduate and Industry, 1115
University Grants (Committee of Public Accounts), 537
University Grants Committee : Returns from Universities and University Colleges in receipt of Treasury Grant, Academic Year 1952–53, 165
University Professors and Lecturers, International Association of : Eighth Conference of University Teachers, 208
University Standards and the Social Background, 1069
University Teachers : Eighth Conference of (International Association of University Professors and Lecturers), 208
Unknown Amino-acid derived from Dates : Excretion in Human Urine of an (Stanley Gartler and Prof. Th. Dobzhansky), 553
Unordered Tetrads Segregating for a Lethal or other Epistatic Factor Analysis of (Dr. H. L. K. Whitehouse), 463
Unsaturated Uronides Production of, by Bacterial Hyaluronidases (Alfred Linker and Dr. Karl Meyer), 1192
Unsaturation : Infra-Red Assignments of, in the Region 900–1,000 cm.$^{-1}$ (Dr. D. Chapman and R. J. Taylor), 1011
Unusual Doubling of Spectral Lines (Rev. J Junkes and Rev. E W. Salpeter), 138
Uptake of Phosphorus-32 by Mycorrhizal Plants (T. M. Morrison), 606
Uptake and Translocation of Phosphorus : Mycorrhizal (Dr. J. L. Harley and Dr. J. K. Brierley), 776
Uraninites : Ages of, by a New Method (Dr. B. Wasserstein), 1004
Uranium Rods and Ordinary Water : Measurements on the Neutron Multiplication in a System of (Rolf Persson), 265, *erratum*, 636
Uredospores of Wheat Stem Rust (*Puccinia graminis tritici*) : Chemical Composition of (Neville Prentice and L. S. Cuendet), 1151
Uri, J., and others : Primycin, a New Antibiotic, 1105
Uridine-diphosphate-glucose : Exchange of ^{14}C-Glucose-1-phosphate with, by the Galacto-Waldenase System (Dr. Raul E. Trucco), 1103
Urine : Phenacetin in (Dr. M. Spaček), 933
Urine (Cattle) Identification of certain 'Ketosteroids' from, as Ionone Derivatives (A. H. Holtz), 316
Urine (Human) : Excretion in, of an Unknown Amino acid derived from Dates (Stanley Gartler and Prof. Th. Dobzhansky), 553
Uritani, Dr. Ikuzo, and others : Increase of Respiratory-rate in Sweet Potato Tissue Infected with Black-Rot, 1060
Uritani, Miyoko, and others : Increase of Respiratory-rate in Sweet Potato Tissue Infected with Black-Rot, 1060
Uronides (Unsaturated) : Production of, by Bacterial Hyaluronidases (Alfred Linker and Dr. Karl Meyer), 1192
Uroporphyrin I in Ethyl Acetate : Solubility of (Dr. E. I. B. Dresel and Miss B. E. Tooth), 271
Urquhart, Dr. A. R : Chemistry and Physics of Synthetic Fibres, 117
Urwick, Lieut.-Colonel L. F. : Awarded the Wallace Clark International Management Award for 1955, 1132
Use of Liquid Propane for Freezing Biological Specimens : Caution in the (Dr John L. Stephenson), 235
Usher, G. (Tinsley, T. W., and) A Colour Test for detecting Swollen Shoot Disease in Gold Coast Cacao, 87
Utilization of Formate-^{14}C for Synthesis of Deoxyribonucleic Acid by Human Bone Marrow Cells *in vitro* (Dr. L. G. Lajtha), 1013
Utilization of Research in the British Commonwealth, 805
Utilization of Saline Water : Reviews of Research on Problems of (Unesco Arid Zone Programme), 782
Utilization of Water Resources : Development and (Report of the United Nations Economic and Social Council), 213
Utopia : The University of, 939
Utopia : The University of (Robert M. Hutchins), *review* by R Brightman, 1164
Uvarov, Dr B. P. *Obituary* of Dr Malcolm Burr, 294
Locust Plagues, 542

VACATION Course in Synoptic Meteorology (Royal Meteorological Society in conjunction with the Council for the Promotion of Field Studies), 633
Vacation School on Aircraft Electrical Systems (Imperial College of Science and Technology), 67, 1001
Vacuum-Distillation Concentration of Potato Root Diffusate by (N. G. Hague), 1018
Vaginal Cornification in Tissue Culture Effect of Œstrogen and of Vitamin A on (Raymond H. Kahn), 317
Vale, R. L. : Awarded a Research Studentship in Chemistry by British Celanese, Ltd., 681
Valentine, Prof C. W. : Animal Behaviour, 859
Valentine, Dr. L. : Chemistry and Physics of Synthetic Fibres, 117
Vallee, Dr Bert L. Simultaneous Determination of Sodium, Potassium, Calcium, Magnesium and Strontium by a New Multichannel Flame-Spectrometer, 1050
Vallisneria Leaves : Transport of Chloride in the 'Symplasm' of (Prof. W. H Arisz), 223
Valonia Electron Diffraction Diagrams of Cellulose Microfibrils in (Prof. R D. Preston and G. W. Ripley), 76
Valves A New Circuit for Balancing the Characteristics of Pairs of (R. E. Aitchison), 704
Valves (Television Receiver) Data and Circuits of (J. Jager), *review* by Dr. R. L. Smith-Rose, 99
Valves and Television Receiver Design, *review* by Dr. R. L. Smith-Rose, 99
Valyi-Nagy, Prof T., and others : Primycin, a New Antibiotic, 1105
Van Santen, G. W. : Introduction to a Study of Mechanical Vibration *review* by Dr. K. M. Entwistle, 1029
Van der Werf, Calvin A., and others : College Chemistry, *review* by G. Fowles, 669
Vanadium Dioxide : Magnetic Susceptibility of (M. S. Archer, D. S P. Roebuck and F. J. Whitby), 754
Vanderhaeghe, F., and others : Influence of Ribonuclease on the Division of Amphibian Eggs, 793
Vapour-phase Chromatography at Relatively High Temperatures : Improvements in (P. R. Cropper and A. Heywood), 1063
Vapours of Halogen Compounds Effect of, on the Emission of Positive Ions from Platinum (Prof. Nobuji Sasaki and Masaru Onchi), 84
Variation of the Shells of *Murex tribulus* from the Great Bitter Lake, Egypt (Dr. Monica Taylor), 1111
Varietal Susceptibility of Brassicas to Molybdenum Deficiency (M. Neenan and O. G. Goodman), 972
Varley, Prof. G. C. Animal Populations and Forestry, 814
Varley, J. H. O. : A Mechanism for the Displacement of Ions in an Ionic Lattice, 886
Vasey, A : Atomic Line Spectra, 731
Vaughan, N. B. (edited by) : Journal of the Institute of Metals, Vol. 80, 1951–52, *review* by Dr. W. Hume-Rothery, 576
Veall, N. (Emery, E. W., and) : Radiation Dosimetry of Iodine-132, 889
Vector and Tensor Analysis (Prof G. E. Hay), *review* by S. Austen Stigant, 1119
Vegetation : Nigerian (R. W J. Keay), 343
Vegetation of Jamaica (G. F. Asprey and R G. Robbins), 66
Vegetation Types of India (Indian Botanical Society Symposium on), 113
Vegetation and Watershed Management (E. A. Colman), *review* by Dr. H. L. Penman, 714
Vegetative Proliferation in Grass Spikelets (P. R. Wycherley), 588
Vehicle and Road Safety (British Association for the Advancement of Science, Section G (Engineering), Discussion on), 630
Velasco, R. (Garcia-Riquelme, O., and) : Atomic Line Spectra, 729
Velden, P F. van, and others : Polymerization Reactions occurring during Dinitrophenylation of α-, β- and ω-Amino-acids with Sanger's Reagent, 1187
Velocity of Electron Pulses (L. L. Whyte, D I. Richards and Dr. D. Gabor), 398, 681
Velocity Ellipsoid (Stellar) : Constants of the (D G. Ewart), 297
Venables, Dr. P. F. R. : Technical Colleges and Industry, 210
Venema, Dr. A. : New Forms of Thermionic Cathode, 1176
Venezuela : Contributions to the Flora of (J. A Steyermark and collaborators), 66
Venge, Ole : A Simplified Method for Spreading the Chromosomes in the Rabbit Blastocyst, 608
Venkateswaran, Dr S. : Appointed registrar of Trade Marks in India, 339 ; work of, 339
Venn, Dr. J. A. (compiled by) : Alumni Cantabrigienses, Part 2, From 1752 to 1900, Vol. 6, Square—Zupitza, *review* by Prof. F. J. M. Stratton, 896
Ventilation of Houses in Britain : Physiological Aspects of the Heating and (British Association for the Advancement of Science, Section I, (Physiology), Discussion on), 577
Venturia inaequalis (Cooke) Wint. Eradication of (K.E. Hutton), 1017
Verdier, Walter H. Physical Facilities for Research, 1044
Verdoorn, Dr. Frans Plant Genera, 71
Vernalization in *Linum usitatissimum* Linn. : Inhibition of, by certain Synthetic Hormones (Dr. S C. Chakravarti), 461
Vernon, C. A., and others : Hydrolysis of Methylglucosides, 560
Vernon, K. D. C. The Library of the Royal Institution, 1799–1954, 242
Vernon, T. V. (Milnes, A. G , and) Awarded jointly a Bowen Prize for 1953 by the Institute of Physics, 208
Vertebrates : Comparative Endocrinology of (International Symposium on the), 543
Very-High-Frequency Broadcasting in Great Britain, 207
Verzele, M., and Alderweireldt, F. : A New Glass Coil for Preparative Counter-Current Distribution, 702
Vesicular Stomatitis Infection of Chickens and Chick Embryos with the Viruses of Foot-and-Mouth Disease and of (H. H. Skinner), 1052
Vesper, Dr. Howard G. : Communication Problems in a Research Operation, 1044
Veterinary College, Royal Appointment of Prof. R. E. Glover as principal and dean, 1132
Veterinary Research in Mexico by the University of Pennsylvania, 954
Vibration (Mechanical) Introduction to a Study of (G. W. Van Santen), *review* by Dr. K. M. Entwistle, 1029
Vibration in Engineering Structures, *review* by Dr. K. M. Entwistle, 1029
Vibrational Phenomena : Pulsatory and (Division of Industrial and Engineering Chemistry of the American Chemical Society Symposium on), 636
Vibrations (Molecular) : Odour and (H E. Hallam), 134
Vibrators (Quartz Crystal) : Ageing of (H. T. Mitchell), 41
Vick, Prof. F. A. : *Obituary* of Dr Saul Dushman, 381
Vickers, Sir Geoffrey : Chemistry in relation to the Development of the Nervous System, 455
Vickers-Armstrongs Scholarship in Naval Architecture awarded by the Institution of Naval Architects to A R Mountfield, 864
Vig, O. P., and others A Novel Synthesis of 4-Methyl-1 . 2-Benzanthracene, 834
Vilain, Dr Jacques : Appointed to a Research Fellowship in physics at the University of Birmingham, 1132
Vilstrup, Thure, and others : Flow Potentials in Hyaluronate Solutions, 1101
Vince, Dr D , and Mason, D. T Acceleration of Flowering in Non-vernalized Chrysanthemums by the Removal of Apical Sections of the Stem, 842
Vincent, A J : Appointed assistant conservator of forests, Federation of Malaya, 344
Vinogradov, A. P. : The Elementary Chemical Composition of Marine Organisms (translated from the Russian by Julia Efron and Jane K Setlow), *review* by Dr L. H. N. Cooper, 808
Virus : Radioactive Tobacco Mosaic (F L. Wynd), 297

Virus (Lapinized Rinderpest): Thermal Reactions of Kenya Cattle vaccinated with (G. R. Scott), 44
Virus (Poliomyelitis): Interference and Cell Protection by, in Tissue Culture (Dr. G. L. Le Bouvier), 649
Virus (Rift Valley Fever): Destruction of Tumour Cells by (Dr. N. Takemori, M. Nakano, M. Hemmi, H. Ikeda, S. Yamagida and M. Kitaoka), 698
Virus (Silkworm Jaundice): Neutralization of, by Human Serum (K. Aizawa), 748
Virus (Tobacco Mosaic). Rapid Extraction of Intact Crystalline Inclusions from the Cells of Plants infected with (Dr. Miguel Rubio Huertos), 313
Virus associated with Canine Encephalomyelitis (James H. Whittem), 359
Virus Disease of the Leatherjacket, *Tipula paludosa*: A Second (N. Xeros), 562
Virus Diseases. Plant Viruses and (Association of Applied Biologists Symposium on), 767
Viruses: The Physics of (Ernest C. Pollard), *review* by H. L. Nixon, 989
Viruses of Foot-and-Mouth Disease and of Vesicular Stomatitis: Infection of Chickens and Chick Embryos with the (H. H. Skinner), 1052
Viruses and Bacteria (Pox): Structural Analogies of (Dr. D. Peters and W. Stoeckenius), 224
Viruses and the Control of Insect Pests (Dr. Kenneth M. Smith), 1173
Viruses and Virus Diseases. Plant (Association of Applied Biologists Symposium on), 767
Visibility of X-Ray Quantum Fluctuations on Image Intensifier Radiographs (Dr. T. Tol and Dr. W. J. Oosterkamp), 397
Vision (Dark): Effect of Ephedrine on (Dr. G. W. Granger), 653
Vision (Sub-normal): A New Development in Aids for (J. Lederer), 977
Visiting Scientists, Society for: Annual Report for 1953–54, 781
Vitamin A. Effect of Œstrogen and of, on Vaginal Cornification in Tissue Culture (Raymond H. Kahn), 317
Vitamin B_{12}. Biological Value of Proteins as Influenced by Dietary (B. R. Baliga, S. Balakrishnan and Dr. R. Rajagopalan), 35
  Relation between Vitamin D and (Allan Frolich), 462
  Structure of—A Crystalline Nucleotide-free Degradation Product of Vitamin B_{12} (Dr. J. R. Cannon, Dr. A. W. Johnson and Sir Alexander Todd), 1168; X-Ray Crystallographic Evidence on the Structure of Vitamin B_{12} (Clara Brink, Dr. Dorothy Crowfoot Hodgkin, June Lindsey, Jenny Pickworth, John H. Robertson and John G. White), 1169
Vitamin B_{12} in Crude Liver Extracts (F. A. Robinson, M. E. H. Fitzgerald, K. Fahr and J. J. Grimshaw), 558
Vitamin D and Bone (Bone and Tooth Society Symposium on), 540
Vitamin D and Vitamin B_{12}. Relation between (Allan Frolich), 462
Vitamin E: Third International Congress on, 777
  A Constituent of Male Sperm Antagglutin related to (Prof. P. E. Lindahl and J. E. Kihlström), 600
Vitamins of the B_6 Group: Antitoxopyrimidine Action of (Prof. Katashi Makino, Takeo Kinoshita, Yoshitomo Aramaki and Shigeru Shintani), 275
Vittori, O.: Physics of Clouds and Precipitation, 958
Vittorio, P. V., and others: Synthesis of Sucrose by Tobacco Leaves, 1038
Vivisection: Research on Humane, 488

WORLD POPULATION AND RESOURCES

IT is generally conceded that a great effort will be required to supply the world's increasing population with adequate food, fuel and raw materials during the next half-century; the complexity, magnitude and seriousness of that problem is well stated in simple terms in a broadsheet (No. 362) dated April 26, issued by Political and Economic Planning. Prepared essentially as a contribution to the World Population Conference in Rome, the broadsheet formulates the main issues in a way that every citizen can understand, and its summary and conclusions should contribute also to a much more intelligent appreciation of the value and limitations of the Technical Assistance Programme of the United Nations, the Colombo Plan and the projects promoted by the United States in accordance with the Point Four Plan than is frequently apparent in discussions in Parliament and elsewhere. The fact that it limits its survey to no more than A.D. 1980 may well help to drive home the urgency of the situation.

The situation to which Prof. A. V. Hill referred in his presidential address at Belfast to the British Association is here presented, not as a dilemma, ethical or otherwise, but as a problem demanding imperatively constructive thought and concerted action. P E P points out that during the past two hundred and fifty years medical science has been developing gradually in Western countries, and its effect on the population has been gradual; corresponding reductions in birth-rates have kept the repercussions within bounds. Now the conquest of disease is making its impact felt much more rapidly on the much larger non-European populations. These are expanding on such an enormous scale that it is possible that the world increase during 1950–80 may about equal the entire world population in 1900.

The reception of Prof. Hill's address two years ago would in itself seem to justify the contention by P E P that even informed opinion has scarcely begun to appreciate the magnitude of the economic, social and political problems which are being generated by a current net increase of more than 70,000 persons a day that is still tending to rise. Such books as "Four Thousand Million Mouths" and "Soil and Civilization" only direct attention to one facet of the problems, and probably the only one to which the ordinary citizen has given even passing attention. The most pressing of these problems is, as P E P points out, that of finding food, materials, fuel and power to take care of the vast increase and at the same time to enable reasonable improvements to be made in the standards of life of the large numbers at present below a decent minimum level. Whether simultaneously it will be possible to realize some of the existing expectations for rising standards of life in the more advanced countries is certainly open to question, and likely to depend on conditions not yet sufficiently clearly understood: it can scarcely be taken for granted, as the broadsheet seems to imply.

The examination of the present position presented by P E P suggests that the growth of world food supplies holds a precarious and narrow lead over the growth of world population. The practical problem, however, is for each country to feed itself, since for most countries imports offer no regular relief to home production. The implication of this view for the United Kingdom is reinforced, moreover, by a firm warning against over-optimistic expectations of large increases in agricultural output in particular areas compared with that long maintained by the more agriculturally advanced and favourably placed food-producing countries. With about sixteen per cent of the land area of the world, the U.S.S.R. still has difficulty in feeding its eight per cent of the world population.

In many of the worst-fed countries, the rate of increase in population is above the average and the rate of expansion of food supply only average or below the average. These countries are also faced by exceedingly difficult economic problems, especially in regard to provision of essential capital and the development of industry and public services. These factors have already damped the optimism with which the Colombo Plan was at first regarded, and the report of the Indian Planning Commission which Prof. Hill quoted has also prompted a more realistic view of the situation. The analysis of the highest rates of increase in the production of food to be attained in the most favourable circumstances and of foreseeable technical improvements as given in the P E P broadsheet discloses no sound basis for the view that production will more or less automatically keep pace with the needs of growing population. Indeed, in the absence of a much more rapid reduction in birth-rates than is at present in sight, it is obvious that the increasing control of disease in the less developed countries is likely to lead to a further expansion in population which will render this most improbable.

The broadsheet does not enter into a discussion of the situation in regard to fuel and power supplies and raw materials, or the demand on the world's economy, for example, that is entailed in the provision of the fertilizers required for the increased production of wheat and other foodstuffs. It notes that implication, for the group which prepared the broadsheet considered also the possibilities of creating resources without calling on any material at present of economic value or likely to become scarce. Its extensive inquiries, however, disclosed no such developments affecting foodstuffs likely to prove of first-rate importance during the next thirty years.

In this respect the broadsheet is less optimistic than Sir Harold Hartley was in his recent Fawley Foundation Lecture (*Nature*, June 12, p. 1126); but it is only fair to add that the broadsheet attempts no more than a presentation of the broad outlines of a problem to be discussed more fully in a subsequent report, which will also review the relationship to population of supplies of fuel and power and of raw materials. It aims at stimulating the searching, informed and dispassionate discussion of the facts in all countries and among all shades of opinion, with the view of agreeing on a diagnosis. This is the immediate need, for only a few governments, notably that of India, have shown a lively awareness of their own problems of matching resources with population.

So far as the broadsheet touches on the long-term outlook for supplies of raw materials, fuel and power, it is quite as realistic as Sir Harold, and though less reassuring it does not anticipate that unmanageable difficulties will be encountered in these fields in the near future. Apart from its warning about the limits set to the general achievement of the best rates of increased production of food in particular areas, and of the danger that the rate of increase in population may itself increase with the rate of increase of food production, the broadsheet is of real value for the way in which it indicates, even more clearly than did Sir Harold Hartley, that we are faced with a series of competitive—not complementary—demands and problems. The four unsolved problems are: increasing existing food production sufficiently to supply extra suitable foods for the annual increase in population; providing suitable foods for the undernourished section in the existing population; producing without detriment to food supply sufficient raw materials, fuel and power to enable the increased world population to earn its living and add to its wealth; and ensuring either access for the increased population to areas where extra food and raw materials can be produced, or the transport and distribution of an increased supply of food and raw materials to countries deficient in home supplies on terms which they are able to pay.

It is this note of realism that requires sounding to-day. Sir Harold Hartley, in his Fawley Foundation Lecture, and also the P E P broadsheet, admit that possibly entirely novel methods discovered as a result of biochemical, microbiological or photochemical research may offer an important contribution to increased food production without the strain on limited resources which the expansion of conventional agriculture would involve. There, however, he reminds us of the importance of an ecological approach. The careless disturbance of the balance of Nature may have unforeseen and serious consequences. If the dangers to mankind depicted with some journalistic licence in Jungk's "To-morrow is Already Here" are to be avoided, much more serious ecological research will be required in forestry, agriculture and horticulture, pest control and animal health and nutrition, nor is such research likely to bring quick returns.

Meanwhile, as P E P points out, no serious evidence has been produced to show that there is extra cultivable land anywhere of sufficient extent and quality and capable of sufficiently rapid development to make any worth-while contribution to the urgent task of feeding the world's daily increment of population; nor can that increment be fed on generalizations or on hopes of what might be done assuming levels of capital and equipment, technical skill, education and management which are not, and are unlikely to become, available. Much can be done fairly quickly to improve yields and output from existing farmlands through better seed and livestock, better farming, more and improved fertilizers, simple but more effective equipment, more double cropping in suitable climates, and through reducing waste. Unfortunately, the very countries where the urgency of achieving these improvements is greatest and where the opportunities are most obvious are also those in which deficiencies in education, adaptability, capital, equipment, communications and physical vigour are most serious.

In directing attention to the limitations which such factors place on technical advances and in pointing to the contributions which can come from better education and the increased vigour arising from improved health, as well as from such capital developments as irrigation and drainage, P E P in this broadsheet tends to correct the materialistic emphasis and outlook of Sir Harold's lecture. Sir Harold seems to overlook not only the importance of this factor of education but also the demands which are made on man himself. The self-control which is demanded—particularly in those areas where population is increasing most rapidly and malnutrition is most rife—in order that the greater productivity which the wise use of science could bring is to keep pace with the needs of an increasing population is unlikely to come unless the campaign against want is accompanied by a no less vigorous campaign against ignorance. Nor is the driving force for such a campaign to be found in any view of man that takes account solely of his physical or material needs.

In Asia and Africa, as in the West, man's hope of a richer and fuller life in any sense rests ultimately on a worthy view of man himself. It is true that, in the backward areas of the world, men can only rise to their full stature and make free judgments between right and wrong when science and industry have removed want and malnutrition and the ignorance which is largely responsible for these conditions. It is true also that below a certain level of physical existence few men can have any apprehension of moral or spiritual values of life, and it is not materialistic to be concerned with devising ways and means whereby ordinary men and women may be raised above this animal level of existence.

Nevertheless, the problem is not a purely physical or materialistic one. Primarily, it is an intellectual problem—a challenge to man's intellect as well as to his self-control. Education, as already indicated, is one of its most important aspects, and this is true at the primary or secondary school level, in the colleges, in the technical colleges, and at the university level, within and without the walls. The solution of this problem involves much more than the right use of science and technology for the efficient use of man's material resources, the appropriate training of a sufficient number of scientists and technologists and technicians, and attracting able pupils to pursue such careers. It equally depends on using the new means of education which science has provided to train men and women to understand how to make use of the possibilities latent in science and technology, and the dangers inherent in the abuse of those possibilities, and to appreciate what is demanded in the way of co-operation and self-discipline in order that society may enjoy the benefits which are within its reach. It implies also that the training of the embryo scientist or technologist shall enable him to understand better the ordinary man and woman whose needs his work will serve, and whose lives will be affected by its results.

Neither education in science alone, nor education without science, will suffice, and herein lies the critical importance of an adequate number of science teachers of high quality and character. That is indeed a first step towards providing means for the solution of the hard technical and political problems that are involved in the utilization and distribution of the world's resources among its expanding population. It is an important contribution towards the taking of the right decisions and the implementation of the policies they imply, once those solutions have been found. Only education can overcome the refusal to face facts which lies at the root of the perennial difficulty of relating knowledge to action ; and in order to succeed, such an education must impart at least some understanding of the outlook and method of science.

The importance of education in this connexion is well seen in the symposium of papers on Technical Assistance Programmes contributed to a recent issue (March 1954) of the *Bulletin of the Atomic Scientists*. It is also apparent in yet another broadsheet (No. 363), in which Political and Economic Planning, discussing the use of private capital for under-developed areas, shows how serious has been the fall in the flow of such capital to these countries, due largely to the ignorance and misunderstandings which education could help to remove. The prospects of stimulating either the flow of badly needed private capital or increasing the supply of technical and managerial experience which accompanies it are slender indeed without deeper understanding on all sides.

The problem of matching the earth's resources with the needs of its expanding population is fundamentally an intellectual problem—a challenge to man's capacity to think, to improvize and to organize. If he will make the effort, there is no present reason for believing that a solution cannot be found which will enable the world's population to be fed adequately, and increasing control maintained over the pests and diseases which take toll of human life and energy, crops and animal life, while ensuring also adequate supplies of materials for industry. But there will be a price demanded in individual self-control, as in that of communities ; and it is not on education alone that we can rely to ensure that the price is paid. Whether, in fact, the nations, and the communities of which a nation is made up, will pay that price and renounce the prejudices and the customs and ways of life that endanger the efficient utilization and effective distribution of the world's resources, will not depend solely on whether an adequate supply of scientists, technologists, technicians, science teachers, and the like is forthcoming, or even on a clear apprehension on the part of the population generally of what science is and how it works. The problem of relating action to knowledge rather than prejudice is not simply an intellectual issue: it is also a moral issue, in the sense that only a worthy view of man can compel the action, and induce men and women to accept the sacrifices, which in one way or another will be demanded of the advanced and also of the more backward areas of the world.

Meanwhile, in Great Britain, no political party seems prepared to deal with the problem of education on realistic lines or to court the unpopularity which might be involved thereby. Trades unions seek to resist changes in practice that would eliminate waste. Even in education and social policy there is much that encourages the increase of the less educable or adaptable types, and tends to undermine incentive and slacken the will to work. Even some lines of research seem to be pursued rather as an excuse for delaying action on already known but unpalatable facts. As Sir Charles Darwin has commented, "the policy of paying most attention to the inferior types is the most inefficient way possible of achieving the perfectibility of the human race". When all regard is had to the possibilities of those advances in knowledge which such researches as Sir Harold Hartley suggested might bring, it should be remembered that mankind has already much knowledge which, if used effectively, could go far towards improving the balance between the demands of an increasing population and world resources. Nor will any fresh largesse which science may confer remove the fundamental need for courage and honesty in the use of present knowledge.

DEBYE'S COLLECTED PAPERS

The Collected Papers of Peter J. W. Debye

Pp. xxii+700. (New York: Interscience Publishers, Inc.; London: Interscience Publishers, Ltd., 1954.) 9.50 dollars.

To celebrate the seventieth birthday of Prof. Peter Debye, this volume containing a selection of his classical papers has appeared. No one during the past forty years has made so many significant contributions to modern physical chemistry as has Prof. Debye: his name will always be associated with such topics as X-ray scattering, the theory of strong electrolytes, dipole moments and, during more recent years, with the scattering of light by colloidal solutions.

In this book his classical papers on these topics are collected together under their respective headings, together with a number of miscellaneous communications, including the important one on the specific heat of solids. While the book is an important one for purposes of reference, it is most valuable in that it gives us a glimpse of the methods of attack adopted by one who, trained as a mathematician, became in turn professor of theoretical then of experimental physics and finally professor of chemistry, in which subject he received the Nobel Prize. Grouping of the papers in subjects in the volume permits us to follow the progress by which the Debye–Scherrer method of X-ray examination of powders was developed and the subsequent excursions into the exploration of liquids and gases. It is interesting to note that Debye gave an independent theory of the Compton effect, but a little later than Compton himself. The section on electrolytes is introduced by the well-known paper of Debye and Hückel, which classical paper is the basis of the present-day concepts concerning electrolytes. During the Second World War the United States Government was interested in developing the synthetic rubber industry, and Debye became interested in methods of examination of macromolecular solutions. His interest in the scattering of X-rays naturally led him to investigate the applicability of Einstein's theory of light scattering to randomly coiled molecules, and as a result a method not only for the absolute determination of the weight-average molecular weights but also of the spatial extension of the macromolecules in solution was developed, probably the most valuable tool presented to workers in the field of polymers.

The volume has, as preface, a brief account of the life of Debye, and this is followed by brief surveys of the various topics by H. Mark on X-rays and light-scattering, C. P. Smyth on dipole moments and R. M. Fuoss on the papers on electrolytes. Papers originally in the German language have been translated into English. Perhaps this is the most unsatisfactory feature of the volume: Debye's papers both in German and in English are remarkably lucid and clearly written; but the translations do not do the author justice. Eric K. Rideal

THE SINEWS OF SCIENCE

Mathematics in Action

By Prof. O. G. Sutton. Pp. viii+226. (London: G. Bell and Sons, Ltd., 1954.) 16s. net.

Prof. O. G. Sutton is to be congratulated on his book "Mathematics in Action". The publisher's simple comment on the jacket that "the book is a straight-forward account of applied mathematics and its influence on modern ideas concerning that nature of the physical universe" is a bald understatement. The story which the author tells illumines the essential features of the scientific method—the search for basic principles hidden within experimental results, and the development of pathways from basic principles to new experiments and speculations.

The writing is simple and elegant, and not without evidence of a dry humour; the author has a flair for simple exposition and has steered a masterly course between the Scylla of over-simplification and the Charybdis of over-elaboration. The book itself is a pleasure to hold and to read; the illustrations have been chosen with care and have been drawn with sympathetic understanding.

In most books on experimental physics one can scarcely see the wood for the trees. Most books on applied mathematics, on the other hand, model themselves on Euclid; after a token genuflexion in the direction of experimental physics, they develop their accounts as a series of deductions from a number of stated general principles. Contact with the world of reality is usually lost, at each new topic, after one or two introductory paragraphs. It is these brief paragraphs which Prof. Sutton has moulded, and expanded, into a book of about 225 pages. "Mathematics in Action" should be of considerable value to young mathematicians, physicists and engineers, in the upper forms of secondary schools, and also in technical colleges and universities. It should be an excellent source-book of ideas for teachers of science, and also for those students of the interpretative humanities who wish to gain some knowledge of how the ideas of physicists and engineers have been made more precise and more powerful through formulation in terms of mathematics. In passing, the book shows how mathematics in action has stimulated both the experimenter and the mathematician.

As the narrative unfolds, the author gives a very personal account of what is meant by 'theory' in physics and mathematics. The way in which ideas underlying some of the theories have evolved is briefly sketched. Empirical formulæ lead to mathematical abstractions; the world of reality leads to the worlds of the mathematician, and these lead back again to the world of reality. The most remarkable thing about this process is that there should be any correlation at all between the two types of world—but experience has shown that there is. One of the really important problems of philosophy is to explain this connexion.

Prof. Sutton traces the development of the ideas underlying classical physics and comments: 'It is a strange thought that a few symbols, 'meaningless marks on paper', have contributed so much to the shape of life as we know it to-day. A mediæval scholar, awakening in our world, would recognize such symbols as spells, magic formulæ which when properly pronounced confer power over the forces of Nature".

To lend point to his comments, Prof. Sutton talks about arithmetic, algebra, complex numbers, calculus, etc.—the tools of the mathematician's trade. Then, in the tradition of the English method of teaching mathematics and physics, he gives a series of examples, which in this case are illustrations from ballistics, waves, the problems of flight, statistics and meteorology. His examples are beautiful little essays. The topics which are discussed are all taken from subjects in which Prof. Sutton has had to work professionally from time to time, and they give some indication of the width of his interests and powers. The book deserves to be read by many people.

L. ROSENHEAD

BIRDS OF WEST AFRICA

The Birds of West and Equatorial Africa

By Dr. David Armitage Bannerman. Vol. 1: Struthionidae to Picidae. Pp. xiii+796+plates 1–37. Vol. 2: Eurylaemidae to Ploceidae. Pp. viii+797–1526+plates 38–54. (Edinburgh and London: Oliver and Boyd, Ltd., 1953.) 2 volumes £6 6*s*. net.

THE author's "Birds of Tropical West Africa" in eight volumes (1928–51) will inevitably be known in future as 'the large Bannerman'. It must remain the basic work, indispensable for many purposes; but it is too bulky to be readily portable, and the earlier volumes are obtainable only with difficulty and at a high price. Now we have 'the small Bannerman' as well, complete in two volumes, and its availability and more compact form will make it most welcome to the field observer. It should be of great help to the latter, and it should stimulate further interest in the subject. There are still many gaps in knowledge which a resident in West Africa can take part in filling; and one may well follow the rule that, if an indubitable observation is 'not according to Bannerman', it is worthy of record.

The new work is essentially a condensation of the older, although the text has been wholly rewritten, and as a condensation it must be judged. The reduction in length has been achieved largely by the omission of detailed technical descriptions, synonymies, references, and separate treatment of geographical races; none of these will be missed by the field observer. On the other hand, the great abbreviation in the account of habits is less easily accepted, as it is especially in this respect that there are opportunities for filling gaps in knowledge, if one can be sure where they exist.

Rewriting has involved distribution to the proper heads of all the addenda to the larger work which were published at its end. The new book professes to be up to date as at the close of 1950, when the manuscript was completed; but one notes that some observations recorded as late as 1952 have, in fact, found a place. Apart from the repetition of the useful identification keys from the larger work, the book consists of the standard information relating to each species. One misses a more general section, giving a comprehensive account of the characteristics of the area, which ranges from arid desert to tropical rain-forest and is traversed from its highlands to its coasts by great rivers.

One welcomes again many of the excellent coloured plates from the earlier work, with a few newcomers, as well as numerous black-and-white illustrations. Turning the pages in the less sunnier clime of Great Britain, one recalls many a characteristic sight—the aerobatics of the brilliantly coloured Abyssinian roller, the trees loaded with the nests of weaver birds, the restless parties of piapiacs on the Borassus palms, the egrets among the grazing sheep, and on some up-river sandbank the crocodile bird of which Herodotus wrote.

LANDSBOROUGH THOMSON

PRINCIPLES AND APPLICATIONS OF CHROMATOGRAPHY

Chromatography

A Review of Principles and Applications. By Edgar Lederer and Michael Lederer. Pp. xviii+460. (Amsterdam: Elsevier Publishing Company; London: Cleaver-Hume Press, Ltd., 1953.) 60*s*.

CHROMATOGRAPHY has grown out of all recognition during the past ten years. Yet, although a number of excellent monographs have recently appeared which deal with special aspects of the subject, none has dealt with the subject as a whole. The publication of this book is therefore timely: the authors have brought together information from a formidably vast field and presented it attractively. They have themselves made distinguished contributions to chromatography, and therefore have a first-hand knowledge of much that they have written. The book is divided into five main sections. The first three deal with the general principles and techniques of the three main types of chromatogram, namely, adsorption, ion exchange and partition. Theoretical aspects are here treated simply but adequately for the purposes of the book. The fourth section is concerned with the applications of these methods to organic substances, and largely consists of chapters each devoted to a particular class. The fifth section deals with the inorganic field and is probably the most comprehensive account of this subject that has yet appeared. Finally, there follows a list of references and addenda to the various chapters which brings the literature survey up to the end of 1952. The completeness of this section is an outstanding feature.

It is remarkable how well the authors have succeeded, in a book of ordinary dimensions, in dealing so adequately with such a wide subject. The emphasis has rightly been on the newer methods, but important aspects of the older have not been ignored. There are many valuable features. For example, more than ninety tables of R_F values are given, which cover many hundreds of substances. There are many tables which give useful information at a glance, and the book is generously illustrated with diagrams and photographs of apparatus, chromatograms, elution curves, and so on. It is an achievement of the book that many of the methods are sufficiently well described to enable one to carry them out in the laboratory without having to delve through a mountain of literature beforehand. Division of the text into many subsections has made for attractiveness in presentation. A word of tribute, too, must be paid to Dr. A. T. James, who translated part of the book from the original French into good English.

In a book which provides so much information, one feels diffident in suggesting that a little more could have been given in one or two places. There might, for example, have been provided representative chemical formulæ for all the numerous classes of organic compounds—for who but the final-year chemistry honours student remembers them all ? Perhaps a more detailed explanation could have been given of how the identification of the products of partial hydrolysis of complex substances helps to provide a picture of the whole structure, and more about how some of the reagents (ninhydrin, for example) used in paper chromatography react with the substances for which they are used. There might be some justification, in view of the correspondence in *Nature* (which is cited), to have included in the historical section some account of the contributions to chromatography made by British contemporaries of Tswett. It would have been helpful if the references, which are arranged in alphabetical order, were each followed by the page number in the text.

These are, however, minor criticisms. The authors and publishers are to be congratulated on the production of an attractive book of outstanding importance. It should be in the hands of those who use chromatographic methods, those who expect to use them and those who ought to use them—that is, every chemist and biochemist.

PHYTOGEOGRAPHICAL WRITINGS OF SIR JOSEPH HOOKER

Pioneer Plant Geography

The Phytogeographical Researches of Sir Joseph Dalton Hooker. By Dr. W. B. Turrill. (Lotsya—A Biological Miscellany—Volume 4.) Pp. xii+267+21 plates. (The Hague: Martinus Nijhoff, 1953.) 19 guilders.

RARELY can Fortune have showered so many of her favours on a botanist as she did on Sir Joseph Dalton Hooker, and seldom can there have been a botanist more fitted to make the most of them. The son of Sir William Jackson Hooker, he was born in the botanical purple, and his father's distinguished career afforded him quite exceptional opportunities for his own scientific work. But his time was also propitious; born in 1817 and living until 1911, his life almost exactly spanned the longest and most complete period of tranquillity, freedom from distraction, and material prosperity that Great Britain has ever known, while his birth made him of such an age that he rode the rising tide of scientific progress at its flood and became, almost inescapably, a foundation member of the new biology. But, above all, Fortune endowed him with qualities of mind and character which enabled him to profit from all these circumstances. Fate offered him a giant's place, and he was big enough to fill it.

As with pioneers in many other walks of life, it fell to Joseph Hooker to say, for the first time, many fundamentally important things about his subject. Nowhere is this more obvious than in his phytogeographical writings, and Dr. W. B. Turrill has therefore done a very worth-while service in reminding us again of their more important passages. It is all too easy to think of such early work only in the idiom of to-day and to forget the part it has played in forging the ideas which now we think of as our own.

Some readers will doubtless be most interested in those extracts which reveal Hooker's attitude towards Darwinism and his gradual, though not very convincing, assimilation of it; but it is with plant geography that Dr. Turrill's book is almost wholly concerned. One's first feeling here is astonishment that so much was known so early in Hooker's career, and some slight chagrin that the advance since then has not been greater; but this is, for many reasons, rather unjust, although the fact seems to remain that only in the realm of palæogeography have we really passed beyond Hooker's comprehension. Many of the problems which troubled him are the problems which still perplex us, very notable among them being that of the way in which the oceanic islands and more isolated mountains of the world have become populated. These are still, as they were in his day, among the most crucial issues of plant geography.

"Pioneer Plant Geography" in the main takes the form of a series of chapters arranged in a formal geographical sequence, each consisting of long extracts from the relevant writings of Hooker, and a summary, by Dr. Turrill, of subsequent work on the same matters. The book is pleasantly produced, and there is a useful bibliography. In total it contains a great deal of information, some of it not easily come by elsewhere, and will certainly become an important source book for plant-geographers. At the same time, it does not conceal some of the exceptional difficulties inherent in a book of this sort. Of these only the author himself can be fully aware, and one hesitates, therefore, to comment on his procedure; but many will, perhaps, feel that Dr. Turrill's decision to abandon the chronological approach was an unfortunate one, since it not only threw away the most potent source of continuity in the narrative, but also deprived the reader of any opportunity of following the development of Hooker's personality and science. In consequence of this the book is somewhat lifeless, which, bearing in mind its subject, is a pity. It is also a little unfortunate that, owing to this geographical arrangement of the book, it first presents the least satisfactory of Hooker's geographical writings and leaves the consideration of his most classic (and earliest) memoirs to the end. RONALD GOOD

Algebraic Geometry

By Solomon Lefschetz. (Princeton Mathematical Series.) Pp. ix+233. (Princeton: Princeton University Press; London: Oxford University Press, 1953.) 30*s.* net.

Ideal Theory

By D. G. Northcott. (Cambridge Tracts in Mathematics and Mathematical Physics No. 42.) Pp. viii+111. (Cambridge: At the University Press, 1953.) 12*s.* 6*d.* net.

IN the volume "Algebraic Geometry", Prof. S. Lefschetz has presented, in amplified form, his lecture notes of pre-war Princeton days. A concentrated account is given in the first three chapters of the algebraic treatment of the subject. Chapter 4, on formal power series, provides a bridge linking this with the analytical treatment. In this chapter, the theories of algebroid varieties and local rings are treated briefly and applied to a study of the local properties of algebraic varieties. Four chapters are then given to the theory of algebraic curves, and this work provides examples of the preceding general theory. The final chapter treats the theory of systems of curves on a surface.

Prof. Lefschetz has certainly dealt with the 'core' of the subject, but it is a pity that the account is so brief and concentrated. It is difficult to escape the conclusion that the book is a summary rather than an exposition. The treatment in one of the main chapters (4) is "admittedly sketchy and often without proofs", and in several places it is necessary to refer the reader to other books or journals for a more detailed account. This fragmentation in the presentation of information seems to be a feature of many contemporary publications; but the publishing houses rather than the authors probably have more to answer for in this matter.

In "Ideal Theory" we have an excellent account of a subject which has developed with a burst in recent years. It is easily the most important advance in commutative algebra for a generation; and the motive for this development has come from the need of algebraic geometers for a sharper and more powerful tool with which to examine the foundations of the subject. Prof. D. G. Northcott has written a very clear self-contained account, and has emphasized the algebraic and the analytic theory of local rings, the subject-matter of which has only emerged very recently.

L. S. GODDARD

Principles of Radar

By Members of the Staff of the Radar School, Massachusetts Institute of Technology. Third edition, by Prof. J. Francis Reintjes and Godfrey T. Coate. (A publication of the Technology Press, Massachusetts Institute of Technology.) Pp. xv+986. (London: McGraw-Hill Publishing Co., Ltd., 1953.) 55*s.* 6*d.*

ALTHOUGH this volume is described as the "third edition", it is in fact the first British publication of the work in normal printed format. In its original form, it was in duplicated typescript, prepared by members of the staff of the Massachusetts Institute of Technology and issued as a classified document in 1944 to students of the Institute's Radar School. An extensive revision of the text was carried out before the material was released for general publication.

The book is essentially a detailed descriptive treatment of the technique of radar, with particular reference to the use and operation of radar installations on wave-lengths of between 1 and 30 cm. (frequencies of 30,000–1,000 Mc./s.). No mathematics beyond trigonometry and simple differentiation and integration are used; and the text is very clearly presented together with 650 diagrams, many of which are of exceptional quality and interest. The book may be recommended as an encyclopædic work of reference for all students, scientific workers and engineers engaged in this field; and users will be greatly indebted to the small band of experts responsible for the assimilation and collection in a single volume of a large mass of technical information and experience.

Fields and Waves in Modern Radio

By Simon Ramo and Prof. John R. Whinnery. Second edition. (New York: John Wiley and Sons, Inc.; London: Chapman and Hall, Ltd., 1953.) 70*s.* net.

THE inclusion in this edition of a chapter on microwave networks is the main change from the first edition. Introductory chapters on oscillations and electric and magnetic fields provide the basic ground for the formulation of Maxwell's equations. Circuit concepts and high-frequency effects are then developed, and lead to a study of wave propagation in guides and along transmission lines. The final chapter on radiation completes the physical picture derived from earlier chapters.

Though written mainly for engineers, there is a good deal of common ground here for the physicist. The lucidity, directness of approach, and skill in presentation make this a most valuable book on electromagnetic theory.

L. JACOB

Inorganic Chemistry

A Text-Book for Advanced Students. By Dr. E. de Barry Barnett and Dr. C. L. Wilson. Pp. xiv+512. (London, New York and Toronto: Longmans, Green and Co., Ltd., 1953.) 35*s.* net.

THIS book is intended for students who have an elementary knowledge of inorganic and physical chemistry, and many common elements and compounds are only mentioned as "too familiar to require description". The arrangement is based on a particular periodic table, and hence many less familiar elements appear before the commoner members of their groups. The old-fashioned name "first short period" is used, though the periodic table on p. 6 shows this to be the second.

The book begins with a short discussion of nomenclature, then deals with the classification of the elements and the periodic law, the determination of atomic weights, natural radioactivity, artificial atomic breakdown, isotopes, the structure of atoms and valency, stereochemistry and crystal structure. After three pages on ore-dressing, the individual elements, beginning with the inert gases, are dealt with, the rarer elements being, of course, included. Special topics such as the hydrides of boron, the metal carbonyls, peracids and the silicates are discussed; but the treatment of polyacids is unsatisfactory, and there are surprising omissions.

Attention is given to industrial processes, and use is made of official publications on those developed in Germany. Brief, but useful, notes on analytical chemistry are given. There are some references to literature. The book contains information not easily found elsewhere and is likely to be useful to students and teachers.

NICOLAUS STENO, SEVENTEENTH-CENTURY ANATOMIST, GEOLOGIST AND ECCLESIASTIC

NICOLAUS STENO (Niels Steensen) not only ranks as one of Denmark's greatest men of science but also occupies a distinguished place within the larger group of naturalists whose activities brought about the scientific revolution in Europe that marks the close of the seventeenth century. In addition, he played a prominent part in the religious life of the period. Not surprisingly, therefore, his life and work have been much studied, particularly by his own countrymen, and their latest contribution to these studies is a record of all Steno's surviving correspondence, both scientific and theological. This occupies two large quarto volumes, which have been edited by Father Gustav Scherz, of Copenhagen, assisted by Joanne Raeder*. Much of the literature about Steno is in the Danish language, or is contained in publications not easily accessible to British readers. An appreciation of the value of his letters depends on some knowledge of his achievements, so that a brief account of his remarkable career may not be out of place here. It is based mainly on the account, written in English, by Prof. Vilhelm Maar, of Copenhagen[1].

Steno was born in Copenhagen in 1638, and commenced to study in the University of Copenhagen at the age of eighteen. One of his teachers was the famous anatomist, Thomas Bartholin, a fact that doubtless influenced the course of his career. After pursuing a medical course in Copenhagen, which was interrupted by a war with Sweden, he followed the usual custom of the times and travelled abroad, to continue his studies at foreign universities. He went first to Amsterdam, and it was here, in 1660, that he made his first important discovery, the recognition of the parotid duct (ductus Stenonianus); here also began a friendship with the naturalist Jan Swammerdam, that continued throughout the latter's lifetime. After four months at Amsterdam, Steno moved on to Leyden, where he remained four years, studying under van Horne and Franciscus Sylvius. He had as a fellow student at Leyden Sir Robert Sibbald, the Scottish physician and naturalist, who records that Steno "dissected in my chamber sometymes, and showed me there, the ductus salivalis superior, he had discovered"[2]. In Holland, Steno gained general admiration, not only for his skill as a dissector and for his capacity for making new observations and drawing sound conclusions therefrom, but also for his pleasant and modest personality. At this time he met, among other well-known men, Benedict Spinoza. His intellectual interests widened, and he studied languages, mathematics and religion. He was now free to enter into discussions with members of the Roman Catholic Church, which had not been the case in Lutheran Denmark. His inclination towards mathematics, and particularly geometry, is reflected, later on, in his method of presenting the results of his anatomical and geological researches.

Family affairs compelled a return to Copenhagen in 1664. The reputation he had by then established as an anatomist would have justified an appointment as professor in the University, but this was not made. He therefore left Denmark in the same year, proceeding this time to Paris. He had letters of introduction to a well-known patron of the sciences in that city, Melchisédec Thévenot, who received him as a guest. French scientists were accustomed to meet for discussions in Thévenot's house, and it was here that Steno delivered his famous discourse on the anatomy and physiology of the brain[3].

Steno spent nearly a year in France, during which time he visited other centres of learning. In Montpellier he met two British naturalists, John Ray and Martin Lister. It is recorded that Ray was present when Steno dissected an ox's head and demonstrated the existence of the 'ductus salivaris'[4]; and Lister describes his meeting in the following terms: "I had ye honour to assist att an Anatomie Lecteur on some particular dissections and demonstrations made by Mr Steno ye Dane himself in my Lord of Ailesburys cabinet. the demonstrations were neat and clever wherein I much [? most] admired ye ingenuitie and great modestie of ye person. . . . Afterwards I visited Mr Steno whom I found infinitely taking and agreeable in Conversation and I observed in him very much ye Galant and honest man as ye french say, as well as of ye schollar"[5]. Steno possibly met also Dr. William Croone, first secretary of the Royal Society, at Montpellier. A little later on he addressed a letter on the salamander to Croone, which was published in the *Philosophical Transactions* of the Society, in 1667[6].

From France Steno passed on to Florence, arriving in the summer of 1665. Soon the Grand Duke Ferdinand II of Tuscany attached him to his court, and thereafter encouraged him in every way to continue his scientific investigations. Ferdinand and his brother Leopold were leading spirits in the Accademia del Cimento, and in Florence Steno moved in the same circle as the members of the Accademia, meeting, among others, Vincenzo Viviani, pupil and biographer of Galileo, and the naturalist Francesco Redi. He also gained the friendship of the anatomist and microscopist, Marcello Malpighi. Meanwhile, fostered by local contacts, his interest in Roman Catholicism developed, and in December 1667 he entered that Church. It seems clear that he took this step without any thought of gaining personal advancement; it led, ultimately, however, to his abandoning science for religion.

In the same month Steno received a summons to Copenhagen from King Frederick III of Denmark, with the promise of a professorship. He delayed his return for various reasons, and when he did set out, in 1668, he travelled north by a circuitous route, reaching Amsterdam in 1670. In the interval, Frederick III had died, and he also learnt that his patron, Ferdinand II, was ill, and so he returned to Florence again. Upon the death of the Grand Duke his patronage was continued by his son, Cosimo III.

---

* Nicolai Stenonis: Epistolae et Epistolae ad eum Datae. (Quas cum Prooemio ac notis Germanice Scriptis.) Edidit Gustav Scherz, adjuvante Joanne Raeder. Vol. 1: Pp. xxxii+480. Vol 2: Pp. xii+481–1028. (København: Nyt Nordisk Forlag, Arnold Busck; Freiburg i Br.: Verlag Herder, 1952.) 175 Dan. Kr., or 105 D.M.

Up to the time Steno first arrived in Italy, he seems to have devoted his life mainly to the study of anatomy and physiology, though not without other interests, as would be expected in a man with his brilliant intellect and inquiring mind. There is, however, no evidence that he had yet considered any of the geological problems which, even at this early date, before the science had gained a name, exercised the minds of not a few scientists. It may appear, at first glance, that there is no obvious link between anatomy and geology, and thus it may be wondered why Steno took up the study of the latter science. The answer is that, as with many of his anatomical studies, chance played a part, though it can scarcely be doubted that he had already discussed geological matters with his Italian friends. The problem of the origin of fossils, for example, had been considered by many Italian naturalists from the days of Leonardo da Vinci onwards. Moreover, in the same year that Steno arrived in Florence, Athanasius Kircher published a voluminous geological work, "Mundus Subterraneus", which most probably came to the notice of Steno. It appears that Steno first gave systematic consideration to the problems of geology through the circumstance that Ferdinand II placed at his disposal for dissection the carcass of a shark. His examination of the teeth led him to compare them with the fossil sharks' teeth known as 'glossopetræ', which were common objects in the Mediterranean region, and to be seen in private collections. Their true origin was still disputed, but Steno, as a skilled anatomist, could scarcely have failed to conclude that there was no essential difference between the fossil and recent varieties. This conclusion naturally raised in his mind a further question. Why are fossil organic remains found in rocks far from the sea? His first tentative views on these questions are contained in the book in which he describes his dissection of the shark[7]. To solve the problem, he did not indulge in speculation, as so many had before him, but went out into the countryside to study the rocks themselves. He published the results of his researches soon afterwards, in 1669, in a book bearing a title that gives little indication of its contents: "De Solido intra Solidum naturaliter contento Dissertationis Prodromus". The 'solids contained within solids' that Steno discusses were the fossils contained in rocks, and also certain minerals upon which, too, he made important original observations. Steno's "Prodromus" was intended only as a preliminary discussion of problems that he hoped to deal with at greater length later on, but, unfortunately, he did not do so. Even so, the importance of his book in the history of geology is outstanding. In it Steno lays down for the first time the fundamental principles of geology in a scientific manner, on the basis of field evidence. The principles stated, though somewhat crudely expressed, for the most part still hold good to-day, although not all the explanations advanced by Steno to explain observed facts were correct. Nor could this be expected at a time when geology was still a science very much in the embryo stage. It was not long before the importance of his book was realized outside Italy, and an English translation by Henry Oldenburg, secretary of the Royal Society, appeared in London in 1671. To the title of this edition Oldenburg added the significant words: "a Foundation for the Rendering a Rational Accompt both of the *Frame* and the several *Changes* of the Masse of the EARTH, as also of the various *Productions* in the same".

Physical science, too, aroused the interest of the versatile Steno, a fact to which attention has been directed by Dr. Axel Garboe[8]. The doctrine of *antiperistasis*, the current explanation of the relation between heat and cold, interested Steno, as it had other seventeenth-century scientists, including Robert Boyle. In Italy, for example, the presence of hot lava in snow-covered Etna attracted attention to the problem. Steno thought that two grottos in the remoter heights of the north Italian Alps, which were reputed to be permanently iced, might throw some light on the question; he therefore made the arduous journey to these grottos, carrying with him a Florentine thermometer, and was able to make observations showing that *antiperistasis* was not a valid explanation of the relation between heat and cold. His account of these journeys, contained in letters to Cosimo III, has been translated into English by Dr. Garboe[9].

Soon afterwards, in 1672, a second royal summons to return to Copenhagen reached Steno, and this time he obeyed it and returned to his homeland. On arrival he was created Anatomicus Regius, because, as a Roman Catholic, appointment to a university professorship was precluded. After his return, Steno made many anatomical demonstrations in the old Theatrum Anatomicum, accounts of which he published in a periodical newly established by his old master, Thomas Bartholin, the *Acta Medica et Philosophica Hafniensia*. However, though by now a somewhat more tolerant attitude towards the Catholics existed, yet his religious faith still made life difficult for Steno in Denmark, and there was, too, a serious conflict in his mind between the opposing calls of science and religion. In consequence, he returned once more to Florence, in 1674, where he became tutor to the son of Cosimo III.

Henceforwards, so far as is known, he abandoned the study of natural science, becoming increasingly interested in religious matters. He took holy orders in 1675, and was made a titular bishop in 1677, receiving the appointment of Vicar Apostolic of Northern Germany and Scandinavia. He then proceeded to Hanover and, after residing in various towns in northern Germany, he died in Schwerin in 1686. During these latter years Steno lived the life of an ascetic and devoted his energies solely to furthering the cause of the Church and the poor. After his death, his body was conveyed to Italy by Cosimo III and buried in the crypt of the church of St. Lorenzo, Florence.

Steno published many books and papers describing his anatomical and physiological researches into the glands and lymphatic system, the heart, the muscles, the brain and the reproductive system. These alone, apart from his contribution to geological science, would be sufficient to ensure for him an honoured name in the history of science. His scientific works have been published in a collected edition under the general editorship of Prof. Vilhelm Maar[1]. In this publication Maar has included a long introductory essay on the life and work of Steno, and an annotated bibliography. Both the essay and the annotations are in English and form the best source for English-speaking readers wishing to study the life and works of Steno. His theological works, too, have been issued in a collected edition[10], edited by Knud Larsen and Gustav Scherz, with an introduction and commentary in German.

Now this extensive collection of Steno's correspondence is available. A detailed review is not practicable here; but a note on the contents of the volumes, particularly in so far as they bear on the history of science, will serve to show that this is a work of importance. It has been edited with great care and erudition, and all matter complementary to the letters is in German. A brief preface indicates that it contains all the letters both from and to Steno which the editors have been able to trace after searching a large number of European libraries and archives, especially those in Denmark, Italy and Germany. Doubtless others were searched with negative results but, while it is evident that the correspondence assembled must approach completeness, its publication may lead to further finds. At all events, it does not seem that possible British sources have been examined. Through the courtesy of the Librarian of the Royal Society, I am able to record that a contemporary copy of a letter from Steno to Dr. William Croone, dealing with medical matters, is still preserved in the Society's archives (though not the original of the other letter to Croone, published in the *Philosophical Transactions*). Its contents indicate a date not long before the publication of Steno's book on the dissection of the shark (1667). The correspondence covering the period of Steno's scientific activities is not extensive, and any additions would be welcome.

In the correspondence as printed, the term 'letter' is to be understood to include everything from friendly informal notes to formal documents such as episcopal communications with Rome. These are printed in the languages in which they were written, mainly Latin and Italian, and are arranged chronologically and numbered consecutively. They total 478, and range in time from a letter written by Steno in 1661 to Thomas Bartholin about his anatomical work to that written from his death-bed in Schwerin in 1686 to the Grand Duke Cosimo III. The editors state that about one-half of the letters printed are hitherto unknown, and only about one-eighth of the total have been published previously. Some are only printed in abstract, but references are provided to sources where they are given in full. Every letter is preceded by a summary of its contents in German, a great convenience for students with special interests. As indicated above, the number of letters of scientific interest is disappointingly few, in relation to the total, and those in Vol. 2, 253 in all, covering the period 1680–86, are mainly, if not exclusively, of theological interest. Fourteen letters that passed between Steno and Bartholin have been printed in full; and among other scientists to whom Steno addressed letters that have survived are Paolo Boccone, Athanasius Kircher, G. Leibniz, Marcello Malpighi, Francesco Redi, Swammerdam, Thévenot and Viviani.

Perhaps the most valuable part of the book for students of the history of science is the long introductory essay which discusses the seventeenth-century background, especially with reference to the life and work of Steno's correspondents. This is followed by an equally valuable index of sources consulted containing upwards of seven hundred references. Vol. 2 concludes with a number of "Additamenta". These include a reproduction of parts of what is known as the "Chaos" manuscript, a document preserved in the Biblioteca Nazionale in Florence, which contains a series of disconnected notes in Steno's handwriting dating from his student days. The additional matter also includes extracts from contemporary letters containing references to Steno and his work. Finally, there is an index of persons and places mentioned in the text.

The production of these two volumes must have required much research, apart from the laborious task of preparing the material for the press. The resulting work is a valuable contribution to our knowledge of the intellectual life of the seventeenth century, and it should find a place in all important reference libraries. As the editors point out, virtually all the material necessary for the preparation of a reasoned assessment of Steno's contributions to science and the Church, and for the preparation of a definitive biography, has now been assembled. It remains only for some author or authors, competent and willing to do so, to undertake the task. Such a biography would be of the greatest interest to students of the religious and scientific history of the seventeenth century.

BOTANY IN THE UNIVERSITY OF GLASGOW

250TH ANNIVERSARY

AT the opening in 1901 of the present Department of Botany in the University of Glasgow, the then director of the Royal Botanic Gardens, Kew, Sir William Thiselton-Dyer, said: "Had it not been for the work of Sir William Hooker in Glasgow University I do not think that Kew would be to-day what it is; and as the University looks to Bologna, so does Kew look to Glasgow". The long connexion between the Glasgow Department of Botany and the Royal Botanic Gardens at Kew was recalled and continued when the director of the Gardens, Sir Edward J. Salisbury, delivered a discourse on "The Creation of a Botanical Tradition" at the 250th anniversary celebrations of the Department on June 15, 1954.

The actual anniversary falls in September, for it was in that month of the year 1704 that John Marshall was appointed keeper of the Physic Garden and to give instruction in botany to students. He continued to teach until his death in 1719. A dual chair of anatomy and botany was founded in 1720 and for some time botany was regarded as the leading subject, perhaps out of deference to Thomas Brisbane, the first holder of the chair, who refused to teach anatomy altogether and soon ceased to teach botany also. At this time occurs the first distinct notice of a University summer session for, in 1727, a Commission of Visitation ordained that Brisbane should teach botany from May 16 until July 1.

Brisbane died in 1742 and his successor, Robert Hamilton, is significantly described in the commission as "professor and *teacher* of Botany and Anatomy". It is doubtful, however, if Hamilton taught any botany, since William Cullen settled in Glasgow in 1744 and soon began to teach medicine, botany, materia medica and chemistry. He gave his botanical lectures in Latin and presented an account of the principles on which the different systems of botany had been founded. Cullen left for Edinburgh in 1756 and Hamilton died within three months. Joseph Black held the chair of anatomy and botany for a year and was succeeded by Thomas Hamilton, the brother of Robert. In 1781 Thomas resigned in favour of his son, William, who was to give botany a considerable share of his time until his death at the age of thirty-one in 1790. The King then appointed James Jeffray, who taught botany for some years; but after 1799 the subject was taught by Dr. Thomas Brown. Brown gave the first lectures on agriculture. After 1808 Jeffray seems to have again taught the botany class; but in 1816 the faculty agreed that Dr. Robert Graham should do it.

The College had had a Botanic Garden since 1704, although at various times it had been in danger of extinction. William Hamilton devoted much time and money to it; but, towards the end of the eighteenth century, cultivation, never easy on the stiff clay soil, became still more difficult owing to the impurity of the atmosphere. As the result of a public movement the Royal Botanic Institution of Glasgow was formed and a garden laid out at Sandyford. Graham, who was appointed first regius professor of botany in 1818, was much occupied with the laying out of the Garden until he left for Edinburgh in 1820 to superintend the formation of the new gardens in Inverleith Row.

In 1820 William Jackson Hooker was appointed with an unusual degree of swiftness to be regius professor, and he began that course of organization of public botanic gardens which continued to the day of his death. Scientific visitors to the Glasgow Garden almost invariably expressed the opinion that it would not suffer by comparison with any other similar establishment in Europe. Hooker had never lectured or even attended a course of lectures; but his tenure of the chair was remarkably successful. His lectures were attended not only by the medical students but by also the public and even by army officers. At the close of his first course the class presented him with a handsome silver vasculum chased with the design of a moss that had been named after him. He published a long series of works, illustrated by himself and by the Glasgow artist, W. Fitch, and made Glasgow a famous source of writing on descriptive botany which probably had no equal at its time. Hooker established a tradition of student excursions which has been carried on until the present day, and at the 1901 ceremony Sir Joseph Hooker described some of his father's excursions in the olden days when there were no railways, cycles, or motor-cars, and very few inns in the western Highlands. The accounts of these expeditions are often amusing, and occasionally professors and students became involved in court proceedings. In 1841 Hooker was appointed to be director of the Royal Botanic Gardens at Kew and was succeeded in Glasgow by John Hutton Balfour, who occupied the chair for only four years, passing on to Edinburgh in 1845, where he earned by his tough assiduity the title of "Woody Fibre".

The only professor of botany to have died in office was George Arnott Walker Arnott, who held the chair from 1845 until 1868. This fact had a marked effect on departmental history, for whereas his predecessors had, on leaving Glasgow, removed their collections and other effects elsewhere, Walker Arnott's library and herbarium were acquired after his death for the University. Throughout the nineteenth century the Glasgow chair of botany served as a stepping-stone to more valuable preferment elsewhere. Sir William Hooker passed on to Kew, Profs. Graham, Hutton Balfour, Dickson and Bayley Balfour (via Oxford) all moved to the chair at Edinburgh. At each step, collections, books and apparatus were removed. Those of Sir William Hooker formed the foundation of the scientific establishment at Kew, while the equipment of the others went to Edinburgh.

Arnott was followed by Alexander Dickson, who arrived just before the opening of the new University buildings in 1870. A beginning was now made in the establishment of a permanent Department of Botany, consisting of a large class-room at the top of the north-east corner tower, with a retiring room and a room for herbarium work, together with two badly lighted attics, without heat, water or gas. Dickson remained for eleven years and left the Department very much as it had been at Walker Arnott's death, except that the herbarium had become infested with beetles.

The vacancy in the chair in 1879 was filled by Isaac Bayley Balfour, a young man, full of energy, and fresh from the Continental schools. Balfour ensured the herbarium for the University. Having worked under Huxley and De Bary, practical classes seemed to him essential, and so he bartered his lecture-room for two small rooms that would serve as laboratories. These were too small for more than a fraction of the students; but they continued to be used for twenty years, first by Balfour and afterwards by Bower. Although Balfour is credited with having introduced practical classes in botany at Glasgow, it should be noted that Hooker required every student to provide himself with a pocket-lens, knife and pair of forceps, with which they followed the professor's demonstrations.

By 1840 the Sandyford site had become unsuitable for the Botanic Garden owing to the spread of the City and so the plant houses were removed to the rural area of Kelvinside in 1842. The Garden was still controlled by the Royal Botanic Institution, and the professor of botany did his teaching in the Garden until 1870. The plant houses became very dilapidated and the herbaceous ground very cramped; but with the support of Sir Joseph Hooker (by that time director of Kew), Bayley Balfour rehabilitated the Garden. His costly schemes hastened the transfer of the Garden to the Corporation, which finally took place in 1891, although the University still retained facilities for the teaching of botany in the Garden.

For forty years from 1885 Frederick Orpen Bower was regius professor, and his greatest domestic botanical achievement was undoubtedly the building of the present Department of Botany. Botany was thus the first science to have a separate building in Glasgow, and although the Department is now short of space, it seemed, in 1900, that Bower had been absurdly extravagant in his provisions. The building was opened in 1901 by Sir Joseph D. Hooker in the presence of Sir William Thiselton-Dyer, Lord Lister and Prof. Bayley Balfour. The jubilee of this event was celebrated in 1951 when the late Prof. F. E. Fritsch was the Department's guest of honour.

During Bower's professorship Robert Kidston was closely associated with the Department, and members of the staff who afterwards became well known elsewhere include J. M. F. Drummond, D. T. Gwynne-Vaughan, W. H. Lang, A. Anstruther Lawson, J. McLean Thompson and J. C. Willis.

The Department continued to grow steadily during the remainder of Bower's time and also during that of his successors, Prof. J. M. F. Drummond and Prof. John Walton (the present incumbent). The need of new laboratories for plant physiology and mycology became felt increasingly and Prof. Walton's striving to obtain these recalls the vigorous efforts of Bower at the end of last century to get a botany building. The result was the Stevenson Laboratory, which was opened by Sir Albert Seward in 1937.

The latest event in the Department's history was the celebration on June 15 of its 250th anniversary. Representatives of many university departments of botany and of the Botanical Society of the British Isles and the Botanical Society of Edinburgh were present and the guest of honour was Sir Edward Salisbury, thus maintaining the link with Kew. In his discourse, Sir Edward referred to the achievements of the Glasgow Department and showed how, through times of prosperity and adversity alike, the advancement of botanical knowledge has there been fostered and ensured. Remarking that a wise man exploits the characteristic features of his environment, Sir Edward said that the Cryptogams had continually been studied in "the perpetually humid atmosphere of Glasgow" where ferns, liverworts and mosses flourish. For Hooker, pteridology "was a major activity in a varied career, and for Bower the absorbing obsession of a lifetime". He added: "Just as the University is far more than a mere assemblage of the faculties of which it is comprised, so, too, the history of a department far transcends the mere succession of professors and teachers, however eminent. It is the good fortune of botany at Glasgow that it has had so high a proportion of those, doing it service, who have not only been gifted in their own field of study, but have been scholars with that intellectual apprehension of proportion and perspective, that is beauty".

Before the discourse (at which the vice-chancellor, Sir Hector Hetherington, presided) the guests and visitors were photographed and entertained to luncheon and tea. Afterwards an anniversary dinner was held, at which speeches were made by Prof. S. C. Harland, Prof. J. D. Mackie (representing the Vice-Chancellor), Prof. J. McLean Thompson, Dr. S. Williams, Dr. G. Bond, Sir Edward Salisbury and Prof. A. R. Gemmell. An exhibition of portraits, letters and various other documents relating to the history of the Department was on show during the day.

It was a matter of great regret to all present that illness prevented Prof. John Walton from presiding over the celebrations. A message from him was read by the Vice-Chancellor and good wishes were sent from the assembly. Prof. Walton's place was taken by Dr. Samuel Williams, the acting head of the Department.

FUNDAMENTALS OF COLOUR REPRODUCTION*

By Dr. R. W. G. HUNT

Kodak, Ltd., Wealdstone, Harrow, Middlesex

When, during the first half of the nineteenth century, certain indefatigable people strove to 'fix the images of Nature', their purpose and hopes were to fix the colours as well as the tones in their pictures, and it would no doubt have seemed to them like an idle tale if some prophet had revealed that photography was to know a hundred years of black-and-white before colour began to intrude in any measure. Yet such is the case, and this in spite of a number of early milestones which held out great promise. As early as 1810, Seebeck and others knew that if a spectrum was allowed to fall on moist silver-chloride paper many of its colours were recorded, although not with any degree of permanence. In 1853 Prof. Robert Hunt published the third edition of his "Photography", which contained a whole chapter "on the possibility of producing photographs in their natural colours"; he described seeing a number of "Heliochromes" which were "perfectly coloured; . . . but the colours soon faded, and it does not appear as yet that any successful mode of fixing the colours has been discovered". By 1890, however, Prof. Gabrielle Lippmann, of Paris, had not only perfected the technique of 'fixing' these colours (by the same methods as are used in black-and-white photography) but had also much improved the process in other ways. Moreover when, just before and just after the turn of the century, sensitizing dyes such as eosin, cyanine blue, ethyl red and (above all) pinacyanol were discovered, greatly increasing the sensitivities of photographic emulsions in the green, yellow and red parts of the spectrum, Lippmann colour photographs of very high quality, even by present-day standards, were produced.

The method, which is illustrated in Fig. 1, is an interference process. During the exposure, the emulsion is backed by mercury, so that the light is reflected back through the emulsion layer, and interference occurs between the incident and reflected beams. Standing waves are formed in the emulsion layer, and hence the latent image is formed in bands at half-wave-length intervals. The emulsion is composed of extremely fine grains so that these bands are resolved, and after development and fixing (in 'hypo' in the usual way) there remain a series of bands of silver separated by distances equal to half the wave-length of the exposing light. Since the grain-sizes are small compared with the wave-length of light, the bands of silver act as mirrors and selectively reflect light of the same wave-length as that which produced the image. It is probably true to say that, but for one fact, colour photography would have started a brilliant career at the turn of the present century by means of the Lippmann method. The one fact is that, in photographic emulsions, the finer the grain, the lower the sensitivity. Lippmann emulsions must have grain-sizes which are small compared with the wave-length of light, and the corresponding sensitivity is such that exposures of the order of half an hour in bright sunlight are

---

* Based on a course of four lectures delivered at the Royal Institution, London, on November 5, 12, 26 and December 3, 1953

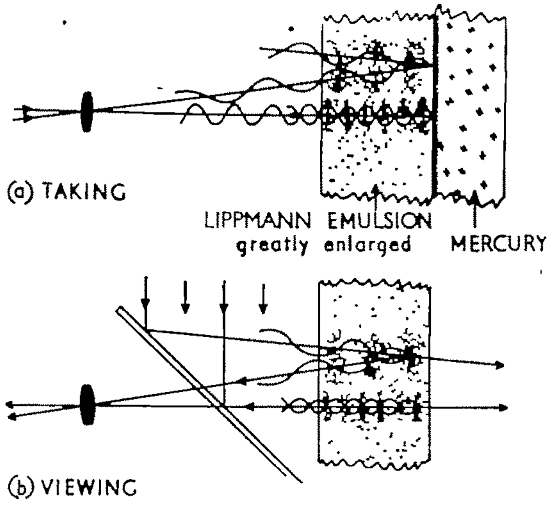

Fig. 1. The Lippmann method of colour photography. (a) Taking in this example the horizontal beam represents green light, and the oblique beam, red light (b) Viewing: the Lippmann photograph is viewed by reflexion; from the incident white light, the bands of silver selectively reflect green light in the horizontal beam and red light in the oblique beam

necessary to produce good Lippmann colour photographs.

So the early dreams of Seebeck, Hunt and others were dashed, not by the difficulty of fixation, but by low sensitivity. The Lippmann process, however, is important to any consideration of the fundamentals of colour reproduction because, apart from the micro-dispersion method (which is often described but never used), it is the only successful method in which the colours are reproduced physically. For any colour is completely defined by its spectral-energy distribution curve, and in a Lippmann colour photograph the attempt is made to reproduce, at each point on the photograph, a colour having the same spectral-energy distribution curve as in the original.

The recording and presentation of so much information in a colour reproduction, however, has long since been known to be unnecessary. For two spectral-energy distribution curves can be very dissimilar, and yet constitute colours which are visually identical; and so we find that the early pioneers were on the wrong track, and that all successful modern methods of colour reproduction, whether in photography, in printing, or in television, stem from a different source.

In 1801, Thomas Young, from physiological considerations, decided that the eye must simplify the complexity of the infinite number of variables in the spectral-energy distribution curve, and proposed that only three variables were involved. This suggestion, which was later to be much elaborated by Helmholtz, came to be known as the Young–Helmholtz, or trichromatic, theory of colour vision.

Young's original pronouncement preceded the invention of photography by about thirty years, and another thirty years were to pass before Maxwell, in his famous Friday Evening Discourse at the Royal Institution on May 17, 1861, demonstrated Young's hypothesis by trichromatic colour photography. Maxwell's thesis was that, if the eye really does analyse all colours into only three variables, 'redness', 'greenness' and 'blueness', then by preparing three negatives, one through a red filter, one through a green filter, and one through a blue filter, and making from them three positive lantern slides, then projecting them in three lanterns fitted with red, green and blue filters, respectively, and superimposing the three images thus obtained, all the colours of the original scene would be reproduced. Maxwell's work, of course, was done thirty years before sensitizing dyes became available, so that the red and green filters used in making the exposures had to be rather pale in order that any image be obtained, even when lengthy exposure-times were given. In consequence, the quality of Maxwell's colour photograph was poor, and, indeed, his purpose in showing it was only to demonstrate the truth of Young's theory of colour vision, and not to lay the foundation stone of successful colour photography. In point of fact, however, this is precisely what he did. His experiment, moreover, is not only basic to colour photography, but to colour reproduction in other media, such as printing and television. Moreover, once satisfactory sensitizing dyes had been produced, Maxwell's method became capable of a standard of excellence in colour rendering which even to-day has not been surpassed, and is seldom equalled. But the inconvenience of three separate projectors, with all the difficulties of obtaining and maintaining exact registration of the three images, has consigned the triple-projection method to the museum and the lecture bench, although in recent years it has been tried again in colour television.

The half-century following Maxwell's discourse produced a veritable spate of arm-chair inventions, and some of the leading inventors of the time showed extraordinary thoroughness; it has been said, for example, of Louis Ducos du Hauron that "there is scarcely a process which he did not foreshadow", and as early as 1869 he realized the distinction between the additive and subtractive principles (both of which derive from Maxwell's experiment in the final analysis).

In photography, the additive processes have had a long and chequered career, but are now almost entirely superseded by subtractive processes. It is very interesting to note, however, that, in colour television, methods are being used which are very similar indeed to the early methods of additive colour photography, and in this respect television is unwittingly recapitulating the history of photography with remarkable precision.

Thus triple projection has been used in colour television and, as in photography, is perhaps also in television the method capable of the highest quality, but with the same attendant difficulties of exact registration and cumbersome equipment.

One of the most attractive ways of simplifying the equipment was to view the three positive images, not simultaneously, but successively, and fifty years ago colour cinematography by means of rotating filter wheels having red, green and blue sectors raised the hopes and emptied the pockets of many an optimist. In television, this method was tried in the early 1930's by Baird, and in the form of the Columbia system was approved by the Federal Communications Commission in the United States in 1950. Unfortunately, in such a system, the blue filter is always much darker than the red and green filters, and the eye can detect the darker filter as a brightness flicker, even when the speed of the filter wheel is fast enough to remove all colour flicker. In fact, in order to remove all trace of flicker it is necessary to present the successive pictures at the rate of about 144 per second, and this requires excessive band-width in transmission. Even at this speed, however, moving objects can sometimes exhibit fringes (colour 'break-up') which are irritating to the viewer. Moreover, this high picture-frequency renders the system 'incompatible'; that is, colour pictures cannot be viewed as black-and-white pictures on existing (black-and-white) receivers, and it was perhaps as well that defence requirements prevented the widespread use of the Columbia system and made it possible for the Federal Communications Commission to approve a compatible system in 1953.

One of the most ingenious of the additive methods of colour photography was the lenticular method. The camera lens was fitted with three strips of red, green and blue filter, and the film was loaded with the emulsion facing away from the lens. The film base had furrows, or lenticulations, embossed upon it, which acted as tiny cylindrical lenses and imaged the red, green and blue strips on to the emulsion, thus analysing the picture into very fine strips exposed through red, green and blue filters. Projection was carried out in a closely analogous manner, using lenticulated films and strips of filter over the projection lens.

The counterpart to the lenticular system in colour television is the Lawrence tube. This has a large number of vertical wires fixed just behind the screen of the cathode-ray tube, and potentials are applied in such a way that a series of lenticular electron lenses is formed. Red, green and blue phosphors are deposited on the surface of the tube in vertical strips, and the potential on the wires is arranged, at one moment, so that the electrons strike only the red phosphor, say. At the next moment, by altering the potential on the wires, the electron lens is altered so that the electrons fall on the green phosphor, say. A further alteration of potential on the wires causes only the blue phosphor to be excited at the next moment. By switching the potentials at any suitable frequency above that necessary to eliminate flicker and colour break-up, a satisfactory colour picture is obtained.

In colour photography, however, the most successful additive processes were those which used mosaics of tiny red, green and blue areas, behind which the negatives were made, and through which the positives were viewed. In this system each original patch of colour is broken up into areas of red, green and blue, too small to be seen separately by the eye. The mosaic pattern was sometimes random, and sometimes regular, the latter being preferable because, in the former, random clumps of areas all of the same colour give rise to a mottled appearance. Again, it is most interesting to see that the additive method which in the end proved the most successful in colour photography is, at any rate so far, the one which has proved most successful in colour television. The type of tube originally developed by the Radio Corporation of America, which is beginning to be used in the United States, contains on its surface a regular array of triads of dots of red, green and blue phosphor. An aperture plate just behind the surface, with one aperture for each triad of dots, acts as a rough pin-hole camera, and 'images' three electron guns on to the three dots. The arrangement provides, of course, for one gun to be imaged on to all the red dots, another on to all the green dots, and a third on to all the blue dots. Mainly as a result of work carried out by the Radio Corporation of America in this field, the National Television Systems Committee of the United States obtained Federal approval at the end of 1953 for a method of transmission which was compatible, and which could be used both with the R.C.A. and with the Lawrence types of tubes.

The subtractive principle is different from the additive in that the red, green and blue components of the image are in one and the same beam of light, so that, in contrast to the additive principle, no light is wasted by the use of red, green and blue filters. Three positive dye images are made; one dye is of such a colour that it absorbs reddish light and freely transmits the rest of the spectrum; another is such that it absorbs greenish light and freely transmits the rest of the spectrum; and the third is such that it absorbs bluish light and freely transmits the rest of the spectrum. The colours of dyes having these properties are known in photography as cyan, magenta and yellow, respectively, but in printing they have for many years been termed blue, red and yellow, respectively (although the blue is slightly greenish, and the red is slightly bluish). The three dye images, when superimposed and viewed in white light, give a satisfactory trichromatic colour reproduction, because the reddish part of the white light is controlled by the cyan dye, the greenish part by the magenta dye, and the bluish part by the yellow dye. It is difficult to see at present how the subtractive principle could be profitably applied to colour television, but in colour photography it has met with very considerable success during the past two decades, particularly in the form of 'integral tripacks'; that is, systems where three emulsion layers are coated in succession, one on top of the other, on the same film base.

In printing, the number of inks used is not always confined to three. Frequently a black printing is added, and special colours—for example, a particular shade of blue—are sometimes printed in separately as well. Sometimes as many as seven or eight different inks are used, and, in this case, colorimetrically the reproduction is more analogous to painting than to photography or television.

Most methods of printing result in the inks being deposited in regular mosaics of dots, and since the mosaics of the different inks overlap in some places, but not in others, the system is partly additive and partly subtractive. Neugebauer[1] has treated the problem quite generally as an additive mixture of eight different colours: cyan, magenta, yellow, red (magenta and yellow superimposed), green (cyan and yellow superimposed), blue (cyan and magenta superimposed), black (all three dyes superimposed), and white (the colour of the paper). Hardy and Wurzburg[2] have proposed an ingenious system of scanning the original colour scene and printing arrays of dots photographically on three separate plates, such that, when these arrays of dots are printed in cyan, magenta and yellow dyes, exact colour reproduction is achieved. Clapper and Yule[3], however, have pointed out that inter-reflexions of light within the layers of ink and the paper fibres introduce errors; but the system is still capable of producing very good results and, in fact, is being increasingly used.

We have seen that a great deal of effort has been expended by many workers over a period of more than a century in the hopes of reproducing colour. Yet even to-day the vast majority of photographs, television pictures and printed reproductions are only in monochrome. The problems to-day, however, are mainly economic and not technical. Colour snap-

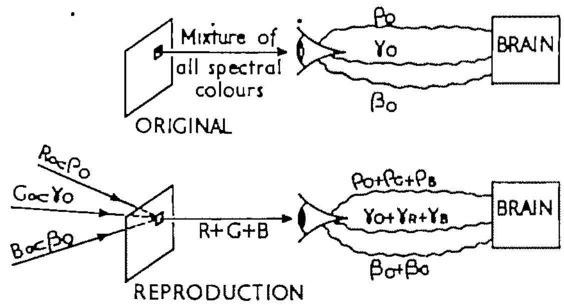

Fig. 2. Diagrammatic representation of why a trichromatic reproduction of an original scene is always inaccurate

shots, cinematograph films, lantern slides, prints, television pictures and printed reproductions have all been, and are all being, produced. Perhaps in fifty or a hundred years time the black-and-white reproduction will be a thing of the past, but only if economic and political factors allow.

There remains one question yet to be answered. How accurate can these colour reproductions be? Since Lippmann and other physical methods of colour reproduction are generally impracticable, the question is really of interest only in the case of the trichromatic methods. The situation in these methods is shown schematically in Fig. 2. The upper half of the diagram represents the situation in which the original object is viewed. Physically, the colour consists of a mixture, in certain proportions, of all the colours of the spectrum. This physical complexity is then, according to the Young–Helmholtz theory, simplified physiologically into three variables only; the magnitudes of these three variables are denoted by ρ_0, γ_0 and β_0 and, according to the theory, the sensation of colour produced by the object is a function of these variables only.

These three signals ρ_0, γ_0 and β_0 may be thought of as being produced by three types of light-sensitive cells in the retina, each having a different spectral-sensitivity curve. Since trichromatic colour reproduction depends for its success on the properties of the eye, it is clear that any system must analyse the colour of the object in the same way as the eye. Hence the three separation images must be recorded by light-sensitive receivers having the same spectral-sensitivity curves (or in certain circumstances any three linear combinations of them) as the three different types of light-sensitive cells in the retina. Although much remains unknown about the mechanism of colour vision, if the Young–Helmholtz theory is accepted these spectral sensitivity curves can be deduced from colour-matching experiments to a considerable degree of accuracy. It is thus possible to select filters for use with photographic emulsions or television camera tubes which result in sensitivity curves closely approximating those required. Three signals are thus obtained proportional to ρ_0, γ_0 and β_0, and, in television, these signals (or combinations of them) are transmitted to the receiving sets, while in photography positives are made from the negatives. Beams of red, green and blue light are then combined to form the colour picture, either additively as in colour television and additive photography, or by the independent modulation of the reddish, greenish and bluish parts of the spectrum as in subtractive photography and in printing. The intensities, R, G and B, of these beams of light are made as nearly as possible proportional to ρ_0, γ_0 and β_0, and if the red light stimulated only the ρ-type of cell, the green light only the γ-type, and the blue light only the β-type, the signals received by the brain on looking at the colour reproduction would be proportional to ρ_0, γ_0 and β_0. It would then only be necessary to adjust the overall intensity of the picture to obtain signals equal to ρ_0, γ_0 and β_0, and hence exact colour reproduction.

The essential conditions for exact colour reproduction may, therefore, be summarized thus: (*a*) analysis of the scene by sensitive elements with the correct spectral-sensitivity curves; (*b*) production of red, green and blue beams of light with intensities proportional to the analysis; (*c*) stimulation by the red, green and blue beams of light of the three types of retinal cell separately; and (*d*) correct adjustment of the overall intensity of the picture. Conditions (*a*), (*b*) and (*d*) can, at least in principle, be well enough approximated to. But condition (*c*) is impossible to realize. Even if the red, green and blue stimuli are carefully chosen monochromatic radiations, the green stimulus invariably excites not only the γ-type of cell but also the ρ- and β-types. Moreover, the use of monochromatic stimuli is precluded in practice by the difficulty of obtaining sufficient intensity, and broader bands of light have to be used. This results in the red and blue stimuli also causing unwanted excitations, and the situation arises wherein the red light gives rise to the wanted signal ρ_0 and an unwanted γ-signal γ_R. The green light results in the wanted γ_0 and in unwanted signals ρ_G and β_G; and the blue light results in the wanted β_0 and in unwanted signals ρ_B and γ_B. The situation that arises is then shown schematically in the lower half of Fig. 2. Instead of the brain receiving the signals ρ_0, γ_0 and β_0, as required, it receives signals $\rho_0 + \rho_G + \rho_B$, $\gamma_0 + \gamma_R + \gamma_B$ and $\beta_0 + \beta_G$. Now the vividness, or saturation, of colours depends on the ratios of the three signals to one another, and additions to all three signals inevitably decrease the ratios. Hence the inability to satisfy condition (*c*) results in practically all colours, but particularly greens, being reproduced too pale.

This effect is in no way dependent on the Young–Helmholtz theory and would be just as true, though more difficult to describe, even if the theory were false.

In subtractive colour photography this effect is enhanced by the fact that the red, green and blue lights have, of necessity, to be broad bands of the spectrum; and the cyan, magenta and yellow dyes also have unwanted absorptions which cause green and blue colours to be reproduced darker than in the original scene. In colour television, however, by solving linear equations electronically, the effects of the violation of condition (*c*) can be limited to those few colours which are too vivid to be matched by any mixture of the red, green and blue lights; in practice, however, this refinement is not usually worth while.

How accurate can colour reproduction be? We have shown that trichromatic colour reproduction can never be perfectly accurate, because of the inevitable violation of condition (*c*). But, in practice, trichromatic colour reproductions are often very satisfactory, and, in fact, the public sometimes feel that the colours are not too pale, but too vivid. It is probable that this feeling arises from violation of condition (*b*); by making the picture of much higher contrast than the original, some increase in the saturation of the colours can be obtained, and this device is often used to lessen the effects of violating condition (*c*). The final saturations of the colours, however, are very seldom greater than those of the original, and are usually considerably less.

Why, then, can trichromatic reproductions be so acceptable? The answer lies very largely in the fact that they are scarcely ever seen alongside the original scenes, and the quality of the reproduction is judged against a mental conception of what the scene probably looked like. But scenes vary tremendously in their colour qualities, and particularly so in colour saturation, according, for example, to the type of lighting and the atmospheric conditions. Moreover, colour reproductions are generally viewed under conditions very different from those of the original scene, and this introduces a number of complicating subjective effects, which depend on the size, brightness and surface both of the picture and its surroundings.

Of colour reproduction, it must be said that accurate methods are impracticable, and practicable methods are inaccurate; and some may be inclined to add that all methods are too expensive. But the urge to 'fix the images of Nature' is just as insistent as it was a century ago, and there are some signs that the early trickles of hope are at last becoming the full floods of success.

OBITUARIES

Prof. K. N. Bahl

KARM NARAYAN BAHL, who died at Lucknow on April 21 in his sixty-fourth year, was one of the great leaders in Indian zoology, and his work is known and admired throughout the world.

He was born on February 14, 1891, at Multan, in the Punjab, and educated at the Government College, Lahore, where he graduated B.Sc. in 1911 and M.Sc. (first class) in 1913, when he was also awarded the Maclagan Gold Medal. As soon as he had taken his B.Sc. he began his university teaching career by becoming demonstrator and assistant professor at Lahore; in 1914 he was appointed professor at the St. John's College, Agra, and in 1916 at the Muir Central College, Allahabad. His first research was on the ant-like spiders of the family Attidæ; but then he turned to the study of the Indian earthworms and very soon made the outstanding discovery of a new type of nephridium. In 1919 he published the first of a series of important papers on earthworm anatomy which appeared during the next thirty years in the *Quarterly Journal of Microscopical Science*; in this first one he described three distinct kinds of nephridia—septal, pharyngeal and integumentary—which he found in the worm *Pheretima posthuma*. It was the septal nephridia which presented such an interesting novelty, for they opened not to the outside of the body, as in all other such organs, but into the intestine; he called them an enteronephric system and made the suggestion, which in later years he strongly supported by experiment, that they were an adaptation for the conservation of moisture in a dry climate. He then visited England to work for two years under Prof. Goodrich at Oxford, where he was awarded the D.Phil. for further studies on *Pheretima*, in which he worked out the blood-vascular system and the development of the enteronephric organs. His earlier discovery had in the meantime won him the D.Sc. of the University of the Punjab. On returning to India in 1921 he was made reader in zoology in the University of Lucknow and two years later became professor; here he did the greater part of his work, remaining in the chair until he retired and was appointed vice-chancellor of the University of Patna in 1951. Many more studies in earthworm anatomy, reproduction and development followed; in these he described enteronephric systems in a number of other genera and, jointly with Dr. M. B. Lal, showed the existence of a 'hepato-pancreatic' gland, with a hepatic portal system, in worms of the genus *Eutyphoeus*. His morphological work was not, however, confined to earthworms; he produced, in the *Records of the Indian Museum*, an outstanding monograph on the skull of *Varanus monitor* with its associated muscles, blood-vessels and nerves. He was awarded the D.Sc. of Oxford in 1938, and in 1942 received the Joy Gobind Law Memorial Gold Medal of the Asiatic Society of Bengal.

Bahl's leadership will continue to be felt in India and the East for many years to come through that excellent series of *Indian Zoological Memoirs* which he initiated and edited. Since he wrote the first on *Pheretima*, seven others, by different authors, have dealt in turn with selected types of the Indian fauna; they are the oriental counterparts of the well-known *Liverpool M.B.C. Memoirs* which have played so important a part in the training of English zoologists. In the words of a review which appeared in *Nature* some years ago, "zoologists in India owe a debt of gratitude to Prof. Bahl to whose enthusiasm this series of manuals is due". The debt will grow and extend through many countries as these memoirs become more widely used; there could be no better memorial to Bahl than this series of volumes. On his retirement he was made a research professor at Lucknow, but his sense of duty then compelled him to accept a pressing invitation to become vice-chancellor of Patna University; here his heavy duties proved too much for him and in 1952 he suffered a breakdown in health from which he never completely recovered. Our sympathy goes to his wife, three sons and a daughter who survive him.

A. C. HARDY

Dr. R. S. Clay

REGINALD STANLEY CLAY died on April 10, after a short illness; he was eighty-five.

Dr. Clay's interests were many and various. He was educated at Tollington Park College and St. John's College, Cambridge, becoming a Wrangler in 1892. His first professional appointment was as physics master at Mill Hill School, and in 1897 he became head of the Physics Department at Birkbeck College. In 1900 he was appointed principal of the Wandsworth Technical College and in 1902 was invited to become the principal of the Northern Polytechnic. There he found ample scope for the exercise of his professional qualifications and administrative ability, which, with his power of winning the sympathetic co-operation of his staff and the respect of his students, enabled him, during his twenty-nine years of office, to make the Institute more widely known and to bring it to a high degree of efficiency. In 1931 he retired, to the regret of all who had been associated with him either as colleagues or students.

During 1907–11 Dr. Clay was the secretary for the Association of Technical Institutions, and in 1936 he joined the board of directors of the United Kingdom Optical Co. at Mill Hill, with happy results for the firm. From 1942 he served the Company as technical consultant on many problems. He was a founder fellow of the Institute of Physics (1918), served on its Board during 1920–33, and in recent years helped to promote the education and training of laboratory technicians. For many years he did admirable work for the *Journal of Scientific Instruments*, was at one time chairman of the Advisory Committee and was himself a frequent contributor.

Throughout his life, Dr. Clay's chief interest and hobby lay in optics. He was a member of the Council of the Optical Society and its president in 1927. Having been a Fellow of the Royal Microscopical Society for some years, he became its president in 1937 and was made an honorary Fellow shortly before his death. He was also a member of the Physical Society, in the activities of which he took a keen interest.

In 1911 Dr. Clay published a "Treatise on Practical Light" which remained the standard text-book for many years. It describes many ingenious pieces of apparatus for demonstrating optical principles. He gathered a unique collection of microscopes, containing an almost complete series from 1670 to 1850. This collection, bearing his name, is now in the Museum of the History of Science, in Oxford, and is described in detail in a book published in collaboration with T. H. Court in 1932, on the "History of the Microscope"; this remains the standard work on the subject.

From 1904 to the end of his life he was closely associated with what is now the National Council for Domestic Studies, being its first treasurer and chairman of the Examination Board. During thirty-seven years he was only absent from the chair on three occasions, and he personally signed nearly thirty thousand certificates. He was particularly interested in training girls in a scientific approach to home life. One of Dr. Clay's major interests was the North London Collegiate School for Girls, now at Canons Park, where he became a governor, representing the Worshipful Company of Clothworkers, in 1929, and chairman of the governors from 1938 until his death.

During both World Wars, Dr. Clay played a part in supplying the Services with optical instruments, and during the second he was attached to the Admiralty Establishment at Teddington, acting as liaison officer between it and various aircraft depots.

On retiring from the Northern Polytechnic, he took an active interest in the Islington Antiquarian and Historical Society, becoming its president in 1948. His interests also extended to the Organ Club, the Newcomen Society, the British Society for the History of Science and the Cactus and Succulent Society. For many years he was an honorary member of the British Acetylene Association.

Dr. Clay married Theodora Tilley, and in 1947 they celebrated their golden wedding.

Dr. Clay's great gifts were consecrated to great ends. He sought to help others and to make life easier and happier for them. He had the power of inspiring respect and affection in others by his cheerful and friendly personality. To all who genuinely sought his guidance he gave freely of his time and knowledge, and he leavened his many activities with a graciousness that endeared him to all.

W. L. DOUGHTY

NEWS and VIEWS

G. S. Ohm (1787–1854)

THE German physicist, Georg Simon Ohm, whose name is immortalized in the ohm, Ohm's law and the ohmmeter, died a century ago, on July 7, 1854. Son of a master locksmith, he was born at Erlangen in Bavaria on March 16, 1787, and entered the local University at the age of sixteen, but left after eighteen months because of lack of means. After holding teaching posts in Switzerland, he returned to Erlangen in 1811, graduated and taught as *Privatdozent*. In 1817 he was appointed professor of mathematics at the Jesuit's *Gymnasium* in Cologne, where by means of experiments made with great skill and care, though with poor and deficient apparatus, he established his law of the theory of the voltaic current, which he published at Berlin in 1827 under the title "Die galvanische Kette mathematisch bearbeitet". Ohm's law, which to-day is regarded as a commonplace, was far in advance of its time, and its announcement fell on deaf ears. Deeply hurt, Ohm resigned his post and led a precarious existence until after many petitions addressed to the King of Bavaria he was made professor of mathematics at the Nuremberg Polytechnic in 1833. The Royal Society of London was the first to appreciate his work, awarding him its Copley Medal in 1841 and in the following year electing him a foreign member. In 1843 Ohm announced his law on the production of complex tones by the composition of simple vibrations. In 1852 he became professor of physics at the High School in Munich, where he died of apoplexy two years later. Small in stature, feeble in body, simple in taste, he never married and lived solely for his work.

Geography at University College, Leicester: Prof. Patrick W. Bryan

PROF. PATRICK W. BRYAN retires from the chair of geography and the vice-principalship of University College, Leicester, at the end of the present session, and has been appointed the first professor emeritus of the College. He received his early training in geography and economics at the London School of Economics under the late Sir Halford Mackinder; early in his career he spent a year at the University of Chicago, where he came under the influence of the school of geography then developing—the 'human ecology' school. The advanced text-book on North America, which was the joint work of the late Prof. Rodwell Jones and Prof. Bryan, was the first in the now well-known Methuen series, and his studies on the corn belt in particular illustrate Bryan's meticulous attention to relevant detail. He will always be associated with the development of the concept of the 'cultural landscape', elaborated in his book "Man's Adaptation of Nature". He was criticized by some for seeking an easy correlation between the features of the landscape and present human occupance; but his ideas have been absorbed in modified form in much current work. Known in later years as a great exponent of visual presentation of geographical facts, his wide circle of friends will wish him a long and profitable retirement, with leisure to follow his photographic interests.

Mr. Norman Pye

MR. NORMAN PYE, senior lecturer in the University of Manchester, is to succeed Prof. Bryan. Mr. Pye was educated at Wigan Grammar School and at the University of Manchester, where he graduated with first-class honours in geography in 1935 and obtained the diploma in education in 1936. After a period as a research student at St. Catherine's College, Cambridge, he returned to Manchester in 1938, as an assistant lecturer in geography; he served in the Hydrographic Department of the Admiralty during 1940–46. He was appointed to a lectureship at Manchester in 1946 and became senior lecturer in geography in 1953. During 1944–46 he held jointly with Dr. W. G. V. Balchin a Leverhulme Research Fellowship for climatological research in Bath and district. During 1952 he received a Fulbright travel grant for research, also with Dr. W. G. V. Balchin, in geomorphology and economic geography in the Mohave and Sonora Deserts, U.S.A. Since 1950 he has been honorary assistant editor of *Geography*. He is also a member of the Council of the Institute of British Geographers and of the Council of the Royal Meteorological Society. Mr. Pye's special research interests have been in the field of physical geography, more especially in climatology and cartography, on both of which topics he has published a number of papers and has now in the press a book on the principles of cartography and surveying. He is also much interested in, and has had considerable experience of, teaching and lecturing on both economic and regional geography. He is also a first-class man in the field and has conducted field courses both in Britain and in European countries.

Royal Society and Nuffield Foundation Commonwealth Bursaries Scheme: Awards

AWARDS under the Royal Society and Nuffield Foundation Commonwealth Bursaries Scheme have been made to the following: Prof. R. H. Common, chairman of the Department of Agricultural Chemistry, McGill University, to enable him to study avian biochemistry, principally at Reading, during July–September; Dr. D. E. Coombe, Fellow of Christ's College and University demonstrator in botany, Cambridge, to enable him to visit West Africa during 1955 to study tropical forest vegetation; Dr. J. Crossland, lecturer in physiology, University of St. Andrews, to enable him to visit Montreal during August–December 1954 in order to collaborate with Dr. K. A. C. Elliott in further studies in the behaviour of acetylcholine in the brain; Mr. J. R. Howes, lecturer in animal husbandry, Imperial College of Tropical Agriculture, Trinidad, to enable him to study problems and methods of research in African animal production, at Pretoria and in Kenya, during July–September; Dr. A. P. Subramaniam, of the Geological Survey of India, to enable him to work with Prof. C. E. Tilley at Cambridge during 1955 on a petrographic study of rocks from the type charnockite area around Madras; Mrs. Patricia M. Thomas, of Adelaide, to enable her to carry out helminthological studies at Macdonald College, Canada, during July–December. These are the first awards under the scheme which was instituted last year to provide facilities for increasing the efficiency of scientific workers of proved ability by enabling them to pursue research, learn techniques or follow other forms of study in natural science in countries other than their own in the British Commonwealth where the physical or personal environment, or both, are peculiarly favourable.

Royal Society Research Appointments

THE Council of the Royal Society has made the following research appointments: the Alan Johnston Lawrence and Moseley Research Fellowship to Dr. D. S. Robinson (Sir William Dunn School of Pathology, University of Oxford) for work on the biochemistry of lipid distribution and transport in plasma, and its relation to the problem of atherosclerosis; Stothert Research Fellowships to Dr. B. L. Ginsborg (University College, London) for work on neuromuscular transmission, and to Miss D. Salmony (Courtauld Institute of Biochemistry, Middlesex Hospital Medical School, London) for work on the effects of sex hormones on cell metabolism; and the John Murray Travelling Studentship in Oceanography and Limnology for 1954 to P. Hughes (University of Liverpool) for study of wind drifts in the oceans.

Atomic Energy Authority

THE Atomic Energy Act, 1954, which provides for the setting up of an Atomic Energy Authority for the United Kingdom, in accordance with the recommendations of Lord Waverley's Committee (see *Nature*, 173, 459; 1954), received Royal Assent on June 4. In the debates in Parliament, concern was freely expressed as to the position of the employees of the proposed Authority, particularly in regard to the security regulations suggested in the original first schedule. When the Bill was debated in the House of Commons, satisfactory words could not be found to define the grounds on which an employee of the Authority would be referred to the purge tribunal as a bad security risk. Such a definition was needed to write into the Bill safeguards for requiring the Lord President's consent to dismissal if the tribunal should recommend it and if the Lord President agreed with it. None of those who spoke in the debate liked the reference to a man's political associations, and in the Committee stage in the House of Lords on May 19 Lord Salisbury accepted on behalf of the Government an amendment by Lord Silkin which avoids the use of these words. In accordance with this amendment, Section 4 of the First Schedule of the Act reads: "Except with the consent of the Lord President of the Council, the Authority shall not terminate on security grounds the employment of any officer of, or person employed by, the Authority. In this sub-paragraph the expression 'security grounds' means grounds which are grounds for dismissal from the civil service of Her Majesty, in accordance with any arrangements for the time being in force relating to dismissals from that service for reasons of national security". This amendment, which puts employees of the Authority in exactly the same position as Civil servants, was afterwards welcomed by Mr. G. R. Strauss on behalf of the Opposition as perfectly satisfactory, when the Lords' amendments were considered in the House of Commons on May 31, and was accepted by the House with other amendments.

At the third reading in the House of Lords on May 27, Lord Salisbury, in reply to questions from Lord Stansgate and Lord Jowitt, explained that the Estimate to be submitted to Parliament in accordance with Clause 4 of the Bill would be in two parts. The first part would cover the expenses of the small office which will assist the Lord President to discharge his atomic energy function. The second, covering some 99 per cent or more of the total, would represent the money which the Lord President would pay over to the Authority. It would be broken down under a number of headings, though the information would be rather less detailed than is usual in regard to an ordinary departmental Vote, having regard both to the need for security and to creation of a body with freedom to run its own day-to-day affairs. The exact form of presentation, said Lord Salisbury, is still being discussed, but the breakdown will not permit a distinction to be drawn between expenditure for civil purposes and expenditure for defence. For security reasons, moreover, sums included in the Ministry of Supply and Service Department Votes for payments to the Authority for work on atomic weapons will not be shown separately, but the degree of parliamentary control provided under the clause is substantially greater than has existed in the past. Referring to the importance of a proper balance of the use of atomic energy between military and civil purposes, Lord Salisbury said that this is a major reason for transfer of responsibility from the Minister of Supply to the Authority. At present none of the energy which will be created will be allocated to private industry; it will all be in the hands of the British Electricity Authority, which ultimately will transmit the electrical power to industry.

Queen Elizabeth House: a New Centre in Oxford for Colonial Studies

A NEW centre for Colonial studies is to be established in Oxford under the joint auspices of the Colonial Office and the University, and H.M. the Queen has been graciously pleased to allow it to be named Queen Elizabeth House. For some time past it has been obvious that the cultural, economic and social life of the overseas territories of the British Commonwealth for which the United Kingdom Government is responsible has been changing very rapidly, and it is imperative that relationships between the people of these territories and those of the United Kingdom (and of the Commonwealth generally) be adjusted in harmony with these changing conditions. Much has already been done by university studies and cultural contacts promoted by government and other bodies; but what has hitherto been lacking is some recognized centre, associated with the many bodies and institutions at work in this field, but not designed to supplant or interfere with their various activities. To this centre students and visitors from overseas, together with persons in Britain concerned with the problems facing the oversea territories, could come for free discussions with others who share their interests and be put in touch with those who can help them in their studies. Such a centre, in addition to the services which it could render to individuals, could provide a setting for conferences and summer schools as well as for more formal courses arranged by government or other authorities for men and women working, or intending to work, overseas. To perform these functions effectively, the centre would have to be residential and located in suitable academic surroundings.

Recently, Sir Ernest Oppenheimer offered £100,000 to the University of Oxford for the development of Colonial and allied studies, on the understanding that a centre of the kind described above would be established in close connexion with the Institute of Colonial Studies already existing in Oxford, though not exclusively linked to it in such a way as would prevent the fullest co-operation with other interested bodies. In recognition of the important part which such a centre could play in the training of Colonial Civil servants and other cognate activities, the British Government has promised a contribution towards building costs of up to £50,000 from Colonial Development and Welfare Funds. The University of Oxford is now co-operating in securing a suitable site and in establishing the centre upon it. In order that the centre may be brought into being as soon as possible, arrangements are being made for constituting a governing body on which official, academic and other interests will be represented.

New Nature Reserves in Britain

Two further nature reserves were declared on June 15 by the Nature Conservancy. The first of these consists of the Huntspill River and Huntspill sea-wall area of about 300 acres and roughly 6,000 acres of tidal mud flats near the mouth of the River Parrett in Bridgwater Bay. Steart Island will be added by a further declaration on the expiry of the existing tenancy over it next year. The mud flats are the scene of a most successful experiment in harnessing vegetation to the work of coastal defence: the introduction of *Spartina townsendii* considerably raised the foreshore-level and gave effective protection against incursions by high tides. Further experiments are planned by the Conservancy in collaboration with the Somerset River Board. The flats are also of great ornithological interest as a roosting place for wildfowl, including wild geese, and for waders, forming the only gathering ground for moulting shelducks in Great Britain. The discontinuance of existing shooting rights will provide a large sanctuary area in which wildfowl and waders can feed and roost undisturbed and build up stocks of these species.

The second new reserve, Castor Hanglands, is in the parishes of Ailsworth and Marholm, four miles west of Peterborough. It consists of 12¼ acres of mixed woodland, known as the Blacklands, and about 93 acres of rough grassland and bushes called Ailsworth Heath, which was originally recommended as a nature reserve in 1947, particularly for the rich insect life and wide range of plant life to which the soils derived from oolitic limestones and calcareous clays give rise and of which few examples remain. There are two small pools in the reserve which support a variety of aquatic vegetation, and the heaths and woodlands harbour the rare butterflies, the black hairstreak (*Strymon pruni*), the large tortoiseshell (*Nymphalis polychloros*) and the chequered skipper (*Carterocephalus palaemon*). Access to Blacklands will be by permit; but there will be no restriction on public access to Ailsworth Heath, though permits to collect will be required.

Ethnology of Saipan in the Mariana Islands

IN Vol. 14 (anthropology) of *Fieldiana* (pp. 384; Chicago Natural History Museum, 1954; 5 dollars), Alexander Spoehr discusses Saipan in the Mariana Islands, and describes Spanish, German, Japanese and recent American rule in those islands. The

Japanese sent many immigrant settlers there and built up an extensive sugar-cane industry between the two World Wars. The destruction of industry in the Second World War was complete. Saipan was an area of intense battle in which 23,811 Japanese military were killed and 1,810 taken prisoner, while the Americans lost 3,144 killed in action and 11,000 wounded. The ethnology is a description of the changing customs and habits of some Chamorro and ex-Caroline islands natives who live in Saipan.

Symposium in Dublin on Peat

An international symposium on peat will be held in the College of Science, Merrion Street, Dublin, during July 12–17, under the auspices of the Bord na Móna, the statutory corporation set up by the Republic of Ireland to develop the peat resources of the country. On the first day, after the formal opening by the Minister for Industry and Commerce, peat resources and development in each of the following countries that will be represented at the symposium will be discussed: Canada, Denmark, England and Wales, Finland, France, Germany, Northern Ireland, Netherlands, Norway, Republic of Ireland, Scotland and Sweden. Subsequent sessions will deal with the following topics: methods of survey; general and technical classification of peats; milled peat; sod peat; dehydration; large- and small-scale plants for utilization of peat; use in gas turbines; peat coke and wax; gasification; and reclamation (afforestation, and also agriculture and soil conditioning). An excursion will be made to the Bord na Móna works. Further information can be obtained from the Bord na Móna, 28 Upper Pembroke Street, Dublin.

International Union of Geodesy and Geophysics

In connexion with the tenth General Assembly of the International Union of Geodesy and Geophysics to be held in Rome during September 14–25, the sponsoring body, the Italian National Research Council, is organizing an exhibition, to be held in the same building as the Assembly meetings, of geodetical and geophysical instruments and equipment. The exhibition will be open to the public during September 13–25. Completed application forms, which can be obtained in Britain from the Assistant Secretary, Royal Society, Burlington House, London, W.1, must be sent by July 15 to the following address: Consiglio Nazionale delle Ricerche, Mostra internazionale di geodesia e geofisica, Piazzale delle Scienze, 7 – Roma (Italia).

Announcements

Sir Frederick Brundrett, deputy scientific adviser to the Ministry of Defence, formerly chief of the Royal Naval Scientific Service, has been appointed chairman of the Defence Research Policy Committee in succession to Sir John Cockcroft, who has been appointed to the board of the new Atomic Energy Corporation as director of the Atomic Energy Research Establishment.

The President of the Board of Trade has reappointed Sir Percy Mills as chairman of the National Research Development Corporation and Prof. P. M. S. Blackett, Sir John Duncanson, and Sir Edward de Stein as members for a further period. Sir Henry Hinchliffe and Sir Alan Saunders are also appointed members in succession to Sir Edward Hodgson and Mr. W. E. P. Johnson, who are retiring.

Sir John Russell has been elected a foreign member of the Académie d'Agriculture de France in succession to the late Prof. Winogradsky.

Prof. H. R. Robinson, emeritus professor of physics at Queen Mary College, has been elected vice-chancellor of the University of London for the remainder of the present session and for the session 1954–55, in succession to Sir Roderic Hill, who has resigned on medical grounds.

Dr. S. Whitehead, director of the Electrical Research Association, has been elected chairman of the Committee of Directors of Research Associations.

The Institution of Production Engineers will be holding an exhibition and conference in London at the National Hall, Olympia, during July 7–14 (closed on July 11). Besides displays by industry on production engineering research and materials, equipment and apparatus which contribute to productivity, the exhibition will contain a number of items illustrating the work of the Department of Scientific and Industrial Research, the research associations, and government departments and other institutions. The conference will consist of morning and afternoon sessions on each day of the exhibition, except July 10, when papers on various aspects of the problems of increased productivity—technical, psychological, physiological, etc.—will be read. Applications for tickets to the exhibition or conference should be made to Andry Montgomery, Ltd., 11 Avenue Chambers, 4 Vernon Place, London, W.C.1; further details can be obtained from the Secretary, Institution of Production Engineers, 10 Chesterfield Street, London, W.1.

Mr. G. Seligman, president of the British Glaciological Society, writes: "With reference to the obituary notice of Prof. A. B. Dobrowolski in *Nature* of June 12, Mr. E. Gold mentions that his great work on ice, "The Natural History of Ice", was published in Polish. However, two of the most important chapters of this work, namely, 13 and 14, were translated into English by Prof. B. W. A. Massey, of the University of Poznan, and were published in 1948 under the title "Glaciers: Structure and Movement Theories", by the Institute of Experimental Physics, Warsaw, as Supplement No. 1 to the *Bulletin of the Polish Geophysical Society*, Part 16 (Warsaw, 1939–48)".

The directors of Griffin and Tatlock, Ltd., and of W. and J. George and Becker, Ltd., have announced the merging of their two organizations, under the name of Griffin and George, Ltd. Griffin and Tatlock, Ltd., with their associated company, Standley Belcher and Mason, Ltd., manufacture scientific apparatus and laboratory furniture in London and Birmingham, and have branch houses in Manchester, Sheffield, Glasgow and Edinburgh. Griffin and Tatlock (India), Ltd., operates from Calcutta and Bombay. The name of the firm, which originated in 1826, is widely associated with laboratory apparatus under the trade mark 'Microid'. W. and J. George and Becker, Ltd., of London and Birmingham, have manufactured laboratory equipment since 1897. The original firm of F. E. Becker and Co. was founded in 1872, and was purchased by W. and J. George, Ltd., in 1897. The company produces an extensive range of products including optical and electrical apparatus and high precision balances, which are sold under the trade mark 'Nivoc'. The chairman of the new company of Griffin and George, Ltd., is R. McKinnon Wood.

FIFTH INTERNATIONAL WEST AFRICAN CONFERENCE

SCIENTISTS working in the several territories of West Africa were long hampered by lack of opportunities for contact with one another. Contiguity of territory enabled the French to extend much of their work over the whole or greater part of French West Africa; but studies in the separate British, Spanish and Portuguese areas lacked correlation. A very important function is thus served by the International West African Conference, which meets every second year, alternating between British, French, Spanish and Portuguese territories. The fifth conference was held at Abidjan (Côte d'Ivoire) during December 7–10, 1953, followed by excursions during December 11–19. Difficulties of accommodation, not the least being space on air lines, necessitated the participation being restricted to official delegates; but those present represented a wide range of interests and regions.

The conference met under the presidency of Prof. G. Mangenot, director of the Institut de Recherche Scientifique et d'Études Tropicales of the Office de la Recherche Scientifique Outre-Mer, and most of the meetings were held at the Research Station of the Institut at Adjopodoumé some 18 km. from Abidjan. Other meetings were held at the Museum and Research Station in Abidjan of the Institut Français d'Afrique Noire, the headquarters director of which is Prof. Th. Monod (Dakar). The smooth running of the conference owed everything to the organizing ability of M. J. L. Tournier, of the Institut Français d'Afrique Noire, who acted as secretary.

Delegates included a dozen from British West African territories and two from Britain (Profs. C. Daryll Forde and L. Dudley Stamp), and the conference opened with a gathering at the Palace of the Governor, followed in the evening by a brilliant and lavish reception at Adjopodoumé attended by leading citizens, both African and European, of Abidjan.

The working sections were those of zoology, botany (including forestry), geography (including geology) and ethnology–sociology (including economics). For some sessions the last two met jointly, and papers of general interest were read to plenary meetings.

It would be difficult to speak too highly of the lavish hospitality of the French hosts. A conference where delegates have no need of money at all, their every wish being anticipated by a system of vouchers, must be almost unique. The insight given into the cultural life of a remarkable tropical city with fourteen thousand white inhabitants was a revelation to many of the delegates long familiar only with their own territories. The conference was in other ways ideal in that it gave abundant opportunities for discussion amid delightful surroundings, and local excursions arranged for all interests formed a pleasant prelude to the two long excursions. Of the latter, one studied the ecology and forestry of the coastal belt, and the other undertook the long journey across to the Liberian border and the eventual ascent of the massif of Nimba.

The conference revealed in a striking way the large volume of fundamental research now in progress in West Africa. In the French territories this is now focused by the Institutes; in the British territories the influence of the University Colleges of the Gold Coast and Ibadan is very marked. Young enthusiastic scientists, not overburdened with routine teaching, are bringing to bear on African problems techniques acquired in universities all over the world. At present, those of European descent play the leading part; but Africans are beginning to take their places in the ranks of the research workers. Detailed studies ranging from the distribution of population, so bafflingly irregular, and the ecology of disease to the measurement of evaporo-transpiration and the economics of fisheries cannot fail to throw light on the innumerable problems which at present hinder the development of tropical Africa and at the moment make nonsense of 'planning'.

L. DUDLEY STAMP

THE GOLGI APPARATUS

SYMPOSIUM OF THE ROYAL MICROSCOPICAL SOCIETY

R 302

ON May 5 the Royal Microscopical Society held a symposium on "The Golgi Apparatus". The opening address was made to a large gathering by the chairman for the morning session, Dr. L. Foulds, who directed attention to the present controversy regarding the intrinsic morphology of the Golgi apparatus.

The first speaker was Prof. J. Brontë Gatenby (Trinity College, Dublin), who expressed his gratitude to the Society for its recent award to him of an honorary fellowship. He then went on to review the various controversies which have been in vogue concerning the morphology of the Golgi apparatus. The most important controversy of all, he said, arose with the vacuome theory of the Parat school (1924–33); but this work has been discredited by many cytologists. It is significant that Parat's term 'lépidosome' instead of 'dictyosome' has not been used in the new great French text-book "Traité de Zoologie". With regard to the recent controversial views, held mainly by the Oxford school, Prof. Gatenby said that on the whole, apart from their use of Parat's word lepidosome, he is in agreement with much that they have written about the structure of the Golgi apparatus of invertebrate cells. However, he cannot accept the view that the Golgi apparatus or network of vertebrate neurones is an artefact. Both Dr. T. A. Moussa and he have seen the network in living neurones, and this has been confirmed by the vital observations of the Americans Adamstone and Taylor. Similar networks have also been seen in living cells of the epididymis by Dr. A. J. Dalton and Mrs. M. Felix. In addition, these latter workers have supplied him with some remarkable electron micrographs which agree with his conception of the networks as being a series of vacuoles, compressed spaces and canals, to the walls of which a chromophile substance is attached.

Finally, Prof. Gatenby gave seven reasons why he believes that the Golgi dictyosomes of invertebrate cells may be regarded as being homologous with the

Golgi networks seen in vertebrate cells. These inclusions occupy similar positions in the undifferentiated cell; play an important part in cell secretion; can be shown by the classical technique; have the same specific gravity when ultracentrifuged; unless dispersed are attached to the centriolar part of the amphiaster at some stage in cell division; cannot be vitally stained in neutral red and methylene blue; and both have the same dictyosome-like appearance in amphibian nerve cells.

After the long paper by Prof. Gatenby, two shorter papers were given by Dr. G. H. Bourne (Department of Histology, London Hospital Medical College) and Dr. A. L. Roque (Department of Zoology, Oxford). Dr. Bourne concentrated on some chemical and biochemical aspects of the Golgi region of certain cells, and pointed out that there is good evidence to suppose that such regions, and therefore possibly the Golgi apparatus, contain lipoidal substances and polysaccharide. Also, in some cells of the adrenal cortex there is a localization of ascorbic acid which corresponds with the position usually occupied by the Golgi apparatus. There is also good evidence to suppose that the Golgi apparatus of the epithelial cells of the small intestine contain alkaline phosphatase and some other phosphatases, including one which dephosphorylates œstrogen phosphate. The epithelial cells of the mouse prostate also contain acid-phosphatase in the Golgi region. Dr. Bourne concluded that these results indicate that the Golgi region, or Golgi apparatus, is of considerable biochemical importance.

Dr. Roque made a report on a detailed study of the form of the lepidosomes (dictyosomes) in the male germ-cells of *Helix*, as revealed by phase-contrast and interference microscopy and by the use of vital dyes. He compared these lepidosomes with the lipochondria of the nerve cells of *Helix* and showed that they are distinct morphologically.

For the afternoon session, the chair was taken by the president of the Society, Dr. T. E. Wallis. Each of the four speakers in this session were from the Department of Zoology, Oxford. The first paper was read by Mr. S. A. Shafiq, who said that in the neurones of *Locusta migratoria* Kolachev preparations reveal the Golgi apparatus as a number of curved rods (dictyosomes) scattered about the cytoplasm. When lipid preparations are made the lipid appears in the form of spheroids also scattered about the cell. In order to see if any relationship exists between the two inclusions, Kolachev preparations were made, but were osmicated for only a short time. Faintly impregnated dictyosomes were seen. On colouring these sections with sudan black it was apparent that the dictyosomes were a deposit of osmium on the curved surface of the lipoidal spheroids. Further proof for this view has been adduced by a study of the developing neurone. As a result of this work, Mr. Shafiq pointed out that the dictyosomes of these invertebrate neurones, being an artefact, cannot be homologized with the Golgi apparatus of vertebrate neurones.

The next paper was read by Dr. W. G. Bruce Casselman and dealt with the histochemistry of the sites in certain cells where osmium tetroxide or silver nitrate are reduced in classical Golgi methods. The study was based on the work of Mr. Shafiq and Dr. John R. Baker, who found that the classical methods when used on the motor neurones of *L. migratoria*, and intestinal epithelial cells and Paneth cells of the mouse, were impregnating mainly lipoidal bodies. Dr. Casselman said that in the motor neurones the lipochondria (= lipoidal bodies) consist principally of phospholipids and cerebrosides. In the intestinal epithelial cells of the mouse, the lipochondria apparently contain only neutral lipids and are embedded in a neutral mucopolysaccharide. The lipoidal bodies of the Paneth cells are embedded in what is probably a mucoprotein and, in addition, are at least partly covered by neutral lipid.

The next speaker was Dr. John R. Baker, who said that a single name can be properly given to an object in a cell if there is reason to believe that it always has essentially the same structure and always essentially the same chemical composition. This does not apply to the term 'Golgi apparatus'. Not only were the 'Golgi dictyosomes' studied by Mr. Shafiq an artefact, but also they were morphologically different from the 'Golgi networks' which Dr. Baker himself had examined in vertebrate neurones. He believed, too, that these networks are an artefact produced in neurones by the over-impregnation of lipochondria. In gland cells a similar network may be an artefact of a different kind, for it may simply result from the deposition of metals on chemically modified cytoplasm between crowded secretion granules. A special study on the intestinal epithelial cells of the mouse had shown that the 'Golgi apparatus' of these cells is an artefact formed by the deposition of osmium on to the lipochondria. Dr. Baker then emphasized the work of Dr. Casselman as showing the lack of specificity of the classical Golgi methods which may reveal 'sites' of dissimilar chemical composition. He urged the discontinuance of the term 'Golgi apparatus', for there cannot be any homology, as the term implies, between objects or regions which differ both structurally and chemically. Further emphasis was placed on the unsuitability of the term 'Golgi substance', for Dr. Baker pointed out that it means nothing to anyone with a biochemical outlook.

The last paper of the afternoon was read by Dr. A. J. Cain, who discussed mainly the concept of homology at intracellular levels. He indicated that, in view of what had already been said by other Oxford workers, objects lumped under the term 'Golgi apparatus' may have been wrongly homologized due to the imperfections of the classical technique.

The chair for the evening session was taken by Dr. R. J. Ludford, and the one paper at this session was read by Mr. Dennis Lacy (Department of Zoology, St. Bartholomew's Hospital Medical College), speaking on the Golgi apparatus of the exocrine and endocrine cells of the pancreas of the mouse. He showed that the various distorting effects which the classical fixatives are supposed to have on the lipoidal bodies are erroneous, and also that the Golgi network of these cells do not result from either the over-impregnation of lipoidal bodies or from the laying-down of metals between secretion granules. Emphasis was placed on the delicate appearance of the networks of these cells as shown by Nassanov, Morelle, Gatenby, Ludford, Hirsch, Bensley, Beams and other distinguished cytologists. None has produced gross over-impregnated structures. The network of these cells was then shown to be a net-like canalicular system, distinct from lipoidal bodies, neutral-red granules or mitochondria. These canals were shown by Mr. Lacy after the use of a variety of fixatives, in frozen-dried preparations and in living cells.

Dr. Ludford then opened up the meeting for discussion. Many interesting points were raised, among which was a question by Dr. A. J. Marshall as to whether the Oxford workers had at any time, in their numerous preparations, seen a canalicular structure. Dr. Baker said that Dr. W. S. Morgan (late of Oxford) had seen the canals in fixed preparations of acinous cells of the pancreas; but that he [Dr. Baker] could not say whether or not they existed, though he could say that they should not be called Golgi bodies.

The main issue which emerged from this symposium was whether or not the term 'Golgi apparatus' (or 'Golgi body', etc.) should be used. According to the Oxford workers it denotes homology between objects believed by these workers to be mainly artefacts, the true form of which is represented by lipoidal bodies which may differ chemically from one another. The Oxford work is, however, based mainly on the results of one invertebrate cell (the neurones of *L. migratoria*) and on two kinds of intestinal cells (epithelial and Paneth). Further, their artefact theory probably cannot be accepted in at least four very different kinds of vertebrate cells (neurones, exocrine and endocrine cells of the pancreas, and epididymis cells), where the evidence from so many sources (fixed, ultracentrifuged, frozen-dried, electron microscope studies and vital examination) leaves little doubt that the Golgi network does exist in life. This latter work shows clearly, too, that the network is not represented by lipoidal bodies, and all the Oxford studies emphasizing chemical dissimilarity are studies on the lipoidal bodies. It is clear that such lipoidal bodies may not be homologous. From the classical point of view, Prof. Gatenby has given seven reasons why he accepts homology between the Golgi dictyosomes of invertebrates and the Golgi network (or canals) of vertebrates and retains the general term Golgi apparatus. The crux of the matter is whether, as yet, there is sufficient evidence of an incontrovertible nature, on a large enough number of invertebrate and vertebrate cells, to justify a change in nomenclature which will affect some two thousand papers.

A full account of the symposium and the discussion which followed will be published in the *Journal of the Royal Microscopical Society*.

DENNIS LACY

THE IMMOBILIZATION OF MINERAL NUTRIENTS IN TROPICAL SOILS

MESSRS. W. V. Bartholomew, J. Meyer and H. Laudelout, of the Institut National pour l'Étude Agronomique du Congo Belge (I.N.E.A.C.), have published a paper which should be of considerable interest to all who are concerned with the underlying causes of fertility and infertility of tropical soils (*Publ. I.N.E.A.C.*, Sér. Sci. No. 57, 1–53, 1953; 30 f.). They have tackled the problem of the immobilization of mineral nutrients under forest and grass fallow in the Yangambi region of the Belgian Congo, and they have given some attention to the decomposition of plant debris on the forest floor. Some understanding of these matters is essential to rational agricultural practice, especially in those regions where the inherent soil fertility is not very great, where it may be of a fleeting character, or where it may indeed be almost incredibly low. In the native rain forest a large proportion of the available plant nutrients is immobilized in living organisms—mostly forest trees and vines—but large quantities of plant tissue (mainly leaves and branches) are constantly being deposited on the forest floor, where they decompose and return their nutrient content to the soil. The reabsorption of these nutrients by elements in the flora and fauna is so rapid in the rain forest that, in the case of an acid sandy soil which was studied, the available supply in the soil was found to be continually kept at an exceptionally low level. The authors consider that under a plant cover with high nutrient demands, it is unlikely that many nutrients are lost by fixation or leaching.

When a forest is felled and a crop established, the transition phase is often attended by the temporary liberation of large quantities of mineral nutrients to the soil and by an accelerated loss of nitrogen, particularly if the area is burned over, as is frequently the contemporary practice. In such instances there may be a considerable, even a high, loss of plant nutrients before the crop has grown sufficiently to re-immobilize most of them. In the usual cultivation practices, however, the new crop is typically established concurrently with the disintegration and decomposition of the forest debris; but even so the utilization of all the nutrients may not keep pace with mineralization, and excessive nutrient losses may result.

Native cropping practices in the Central Congo Basin usually permit the return of forest species within 2–3 years after the forest is felled, and the ensuing fallow or regeneration period may continue for about fifteen years, where there is government supervision; but it may be considerably less. While this kind of soil management has its defects both in terms of soil fertility and labour, it "appears to be a practical solution to the soil management problems where land is in good supply, demand is not great for agricultural products, transportation to market and supply is long and costly, and where local fertilizer resources are either non-existent or not developed".

In both forest and grass fallow the authors point to two factors as being of first importance in enhancing soil fertility, namely, the accumulation of nutrients in organic combinations and the prevention of their loss by plant immobilization, and the improvement of soil structure by rest from cultivation and by biological activity.

The use of grass fallow as an alternative for short rotations has been considered, but its value in native agriculture requires fuller exploration. The maximum usefulness of grasses as fallow crops is probably attained within a few years. It has been observed that after two to four years the rate of root formation reaches a maximum and that decomposition of the grass residues proceeds as rapidly as the new growth is formed; that is, a maximum immobilization of plant nutrients in organic form has been attained. Thereafter, the chief effects of an extension of the fallow period would be to improve the soil texture.

As the immobilization of mineral nutrients may be the most important means of evaluating the usefulness of fallow systems, an investigation was carried out to obtain some indication of the actual amounts of nutrients immobilized under forest fallow conditions after different periods of time and to compare the effects of grass and forest fallows. The sites selected for sampling in the more mature forest fallow areas were approximately 10 × 30 metres. All the vegetation of suitable and representative sub-plots was collected and weighed green at the site, leaves being separated from branches and trunks from roots. Samples of these materials were duly analysed for their water, mineral and organic contents. Litter samples, subdivided into foliar and stem materials, were similarly analysed. Grass samples were taken from replicated plots of different species representative of fallow areas. It was found that the immobilization of nutrients in the forest fallow is initially rapid: in the first five years more than half the total amount immobilized in eighteen years is accounted for. Leaf growth rapidly approaches a maximum, the later increases in total growth being chiefly due to the accumulation of woody materials, especially in the aerial parts. Roots also approach a maximum at a rather rapid rate. The data at five years show 75 per cent as much growth as at eighteen years. Litter accumulation from leaf and stem residues approaches a maximum some time between eight and twelve years.

In grass fallows, it was noted that a large part of the total harvested material consisted of litter in various stages of decomposition, this being in sharp contrast to either the quantity or proportion of litter in the forest fallow plots. The total root weight in the grass fallows was considerably less than in the forest fallow, though the small and fibrous character of grass roots must here be borne in mind.

The distribution of the nutrients in the different plant parts is important. Thus, leaves comprise only a small proportion of the total weight of plant material except during the early stages; woody tissues, of both stems and roots, account for most of the total weight. In the immobilization of nutrients, however, leaves are considerably more important than woody tissue, particularly in the uptake and release of nitrogen. The woody tissues contain the major proportion of all nutrients, except in very early stages of the fallow, and are particularly important as repositories of the cations and phosphorus.

In the grass plots, it was found that the litter contained a large proportion of the plant nutrients, the roots accounting for only 10–20 per cent. Also, grass is relatively higher in phosphorus and potassium and lower in calcium and magnesium than forest fallow. In the investigators' view, for short fallow systems, the grass fallow compares favourably with the forest fallow, in that it appears to absorb nitrogen and phosphorus at a more rapid rate in the early stages of development. It could not, however, be expected to immobilize the large total quantity of nutrients found in a mature forest fallow.

The rate of nutrient release from fallow forest residues after clearing for cultivation was not specifically studied; but estimates based on the data of decomposition experiments and on a knowledge of mineralization processes of plant materials yield some points of considerable practical importance. Burning of forest fallow or grass fallow releases the immobilized nutrients immediately, a large proportion of the bases (potassium, calcium, magnesium, etc.) and phosphorus being deposited as the oxides on the soil surface; nitrogen, on the other hand, is almost totally lost into the atmosphere, either as free nitrogen or as volatile oxides. After burning, it is, of course, the availability of nutrients that is of special interest and this may present problems of some complexity. Thus, the phosphorus may be partly fixed in relatively unavailable form before the newly planted crops can absorb it; and potassium may be fixed, or lost through drainage. The available nitrogen, on the other hand, because of its release from immobilization in the woody tissues, may be higher immediately after burning than where the vegetation is simply allowed to decay. In general, if the fallow vegetation cover is not burned, its nutrients will tend to be retained in organic combination until they are released by the action of micro-organisms. The major part of the nitrogen, phosphorus and other mineral nutrients is rapidly liberated in mineral form, but, simultaneously, these are taken up again in the synthesis of the cellular materials of the invading micro-organisms. The net difference between mineralization on one hand and this new immobilization on the other gives a measure of the nutrients available for use by crop plants. During vegetable decomposition, potassium and phosphorus are lost more rapidly than nitrogen. In plant residues and in micro-organisms, the ratio of nitrogen to phosphorus approached 7–8 : 1. In soil organic matter Pearson and Simonson found ratios ranging from 7·0 : 1 to 15·7 : 1 with a mean of about 9·3 : 1. The authors record that the litter from the forest fallow plots, and litter gathered from the native forest, had a nitrogen to phosphorus ratio of about 25 : 1. In the residue from the decomposition of the mixed forest leaves the ratio was 32 : 1, and in the decomposed litter from the grass plots it was 12 : 1. They consider that it is unlikely that nitrogen could be rapidly liberated during the initial stages of decomposition of forest or fallow vegetation, as the organisms causing decomposition will initially re-absorb a part of it. Hence, burning the fallow vegetation may actually result in a better nitrogen supply during the early stages of utilizing forest or fallow land than natural decomposition after felling but without burning.

The release of phosphorus from decomposing vegetation is likely to be more rapid than that of nitrogen; and potassium, calcium and magnesium should be rapidly released because of their relatively low utilization in the metabolism of micro-organisms. In the case of potassium this rapid loss was demonstrated experimentally. But calcium and magnesium, though they are liberated and made available, form various insoluble salts, for example, carbonates, sulphates and phosphates. They are not removed by leaching and remain as a part of the decomposed residue. This property makes difficult the measurement of mineralization. The authors conclude that mineralization of nitrogen and phosphorus from grass fallow will, in general, be more rapid than from forest fallow. Potassium from grass fallow will be similar to that from forest fallow, but in each case the rate of release would be related to the total quantity immobilized. Calcium and magnesium were found to be low in the grass samples examined and therefore are not likely to be supplied rapidly from such fallow systems. They also point out that the decay of forest residues may not provide a balanced nutrient supply for some crops and that the relative concentration of available nutrients may undergo important changes during the course of the decomposition; for example, nitrogen may be immobilized to a much greater extent than the other nutrients. The liberation of the elements through biological decomposition is a slow process and in 4–6 months forest fallow residues may yield no more than 30 to 50 per cent of the total potassium or calcium and magnesium, and 15–30 per cent of the total phosphorus, while the percentage release of nitrogen may be even smaller.

TOBACCO RESEARCH BOARD OF SOUTHERN RHODESIA

NEW HEADQUARTERS STATION AT KUTSAGA

By Dr. F. A. STINSON

Director of Tobacco Research, Southern Rhodesia

TO solve the production problems of the expanding tobacco industry in Southern Rhodesia, the growers and Government jointly established in 1950 the Tobacco Research Board. Interest and confidence of growers in results of research have been considerable, owing to their representation on the Board and to the direct financial contribution they make toward it—more than £2 for every £1 provided from general taxation.

The Board's research approach is agronomic in its broad sense, and the investigations on crop rotations serve to illustrate this. Comprehensive rotation experiments were developed owing to the inadequacy of systems of cropping used on farms in all tobacco-growing areas. Their design permits comparing the effects, on yield and quality of tobacco, of growing many different crops in various sequences with a range of fertilizer practices, management and methods of crop disposal. Study of crop nutrition, soil organic matter and methods of disease, insect and eelworm control is also an integral part of these projects.

Experiments of lattice and factorial designs are used extensively to examine effects of inter-related production factors. Simultaneous examination of the important factors bearing on a specific problem has helped to minimize the dissipation of energy which would otherwise result if, in evaluating methods of controlling a leaf spot disease, for example, such important factors as date of planting, soil fertility and the effects of cropping systems on eelworm incidence were overlooked.

The excessive drainage and excellent aeration that make Rhodesian sandvelds so suitable for flue-cured tobacco pose special problems in humus replenishment and fertility maintenance. The abundance of available nutrients required for rapid growth and economic yields, along with the sensitivity of leaf quality to changes in nutrient balance, give nutritional research—both in the field and in the laboratory—a high priority in the programme. Present fertilizer investigations include examination of rates of use and sources of nitrogen, phosphorus, potassium and magnesium. Methods of fertilizer placement and the efficiency of nitrogen and potassium when applied fractionally, as well as responses to trace elements applied singly and in combinations, are being examined. Disease, insect and eelworm control investigations occupy an important place in the Board's work. Methods of producing tobacco seedlings, as well as cultural and curing practices, receive attention. The varietal improvement work includes testing and comparing the ability of particular varieties to produce high quality and yield, as well as evaluating their resistance to various diseases and types of eelworm damage. Breeding work in progress is designed to introduce resistance or immunity while, at the same time, further improving the leaf qualities of those varieties now in common use for commercial production. By introducing improved varieties, materials and methods as standard treatment in all field experiments as soon as their superiority is indicated by research, such factors are proved on a farm scale before being offered to farmers in the form of recommendations.

The procedure in laying out field experiments has been standardized within the organization. Fields are divided into ranges and permanently benchmarked to accommodate 60-ft. rows of tobacco. Plots differ in width only; the number of rows per plot varies from one to eight, depending on the nature of the experiment. A permanent system of roadways and surface drainage is provided by placing the 60-ft. wide ranges 25 ft. apart, each intervening strip consisting of a broad-based terrace and a broad, shallow channel. The direction of ranges to field slope is adjusted so that the fall in the rows of tobacco and in the drainage channels ensures surface drainage without causing erosion. Ant-heaps up to 100 ft. in diameter and rock outcrops, common in Rhodesian tobacco-farming districts, complicate the siting of field experiments.

An important stage in the organization's development was marked by the formal opening of the Kutsaga Station on January 21 this year. This Station, which is near Salisbury, is now the headquarters of the Tobacco Research Board. Before Kutsaga was established, the Trelawney Station, opened by the Government in 1934 and leased to the Board in 1950, was the centre of tobacco research, and it will be operated in future as a branch station.

Kutsaga occupies 585 acres alongside the new national airport, ten miles south of the Federal capital. The research building provides spacious chemical and biological laboratories, a library, staff canteen and stores; the addition of two laboratory wings is anticipated. The laboratories are fitted with electricity, gas and hot and cold water. The Cape-Dutch design of the building blends with its natural surroundings of indigenous trees on a sandy slope typical of those in much of the tobacco-growing region. The slate roof, the teakwood terrazzo floor and the mukwa panels and fittings are in keeping with the importance of the country's largest industry which the Board serves. At the rear of the main building is a 100-ft. greenhouse and headhouse containing a laboratory and storage and potting room. Farm buildings for handling, curing and grading leaf from experimental plots were ready for the 1953–54 crop. Modern residences have been erected on the Station for key staff members, and substantial brick homes, with modern plumbing and sanitation, are being provided for all African employees and their families.

Staff are encouraged to obtain postgraduate experience outside Rhodesia, the Board's paid study-leave scheme being designed to facilitate this advanced training. There are also bursaries to assist above-average Rhodesian students to qualify at leading universities preparatory to employment by the Board. At present the Board has a professional staff of fifteen, including a biometrician.

The Board is aware of the importance of keeping the sponsors, especially tobacco growers, fully informed on the progress made. The frequent publication of reports of progress, bulletins and interim reports, as well as the preparation of material for the Press and radio, is regarded as an integral part of the work. The new facilities at Kutsaga will contribute to progress in all branches of the present programme.

The land and buildings at the Kutsaga and the Trelawney Stations have permitted the development of research on most phases of tobacco production. More than four thousand plots were employed in the field experiments during the 1953–54 season. Lack of research information previously retarded development of Southern Rhodesia's flue-cured tobacco industry; but already the growers are extensively adopting with advantage the results of current research.

INDUSTRIAL RESEARCH AND DEVELOPMENT IN THE UNITED STATES

A SURVEY of industrial research and development in the United States conducted in 1952 by the Research and Development Board of the Department of Defense has been issued by the United States Department of Labor*. The report is based on a questionnaire sent to private companies and non-profit research agencies (excluding colleges and universities, as well as hospitals and museums). Some ninety-six thousand research engineers and scientific workers were employed in January 1952 by the two thousand companies which replied, and nearly 75 per cent of these were working for firms engaged in the aircraft, electrical machinery, chemicals and allied products, professional and scientific instruments, machinery (except electrical) and petroleum-refining industries, more than half being employed in the first three of these industrial groups. Two out of three engineers and scientists were on the staffs of companies with five thousand or more employees; but only 1·5 per cent of the employees of the reporting companies were research engineers or scientific workers. About half of them were working on federally financed projects, almost all of which were sponsored by the Department of Defense or the Atomic Energy Commission, and the number so employed was more than 50 per cent higher in January 1952 than in January 1951, although employment on company-financed research increased in most industries during the year. On an average there were 1·5 support workers (technicians and other laboratory assistants, clerical and administrative staff) per research engineer or scientist; but the ratio varied widely between companies and industries.

The annual turnover of this research staff during the year July 1950–June 1951 was 13·9 per cent, or about one-fifth higher than during the last half of 1951, when military service only affected about 3 per cent, although one-fourth of the research staff covered by the study were in the categories most liable to military service, 19 per cent were in the Reserves or National Guard, and another 6 per cent were classified 1 *A* or 2 *A* by Selective Service as of January 1952.

Expenditure of the reporting companies on research and development in 1951 was nearly 2,000 million dollars, compared with a national expenditure on scientific and engineering research and development of about 3,750 million dollars, of which about 2,500 million dollars was for work done in laboratories and other facilities owned or operated by private industry. Of this 2,000 million dollars, more than 1,000 million was spent by the electrical machinery, aircraft and chemical industries, and nearly half of the 1951 research and development expenditure was provided by the Federal Government, ranging from 85 per cent in aircraft manufacture to 3 per cent in petroleum refining. Such research accounted for about three-fifths of the total in companies with less than five hundred employees, compared with about one-half for larger organizations. Research costs amounted to about two per cent of the total value of sales of the reporting companies in 1951, reaching 13 per cent in the aircraft industry but falling to less than 1 per cent in several others. The average cost per research scientist or engineer in 1951 was 21,900 dollars, being lowest in the chemicals and allied products industry and nearly four times as great in the motor-vehicle industry. Taking supporting workers into account, the average cost per research worker was 8,800 dollars, a ratio which varied much less among industries and companies than that for research scientists and engineers.

CAMBRIDGE OBSERVATORIES

REPORT FOR 1953

THE report of the Observatories Syndicate of the University of Cambridge for the year ending September 30, 1953, includes the following headings: reconstruction and re-equipment; solar research; stellar photometry; optics; other investigations; buildings and grounds; lectures; and published papers. The following are the more outstanding items in the report for which there is space in this short article to mention. After exhaustive tests by Drs. H. von Kluber and Z. Suemoto, the spectrograph in the new solar tunnel has been completed and put into use. The grating in the instrument, a modern one lent by the Mount Wilson Observatory primarily for the 1954 eclipse, has proved far superior in general optical quality to any other possessed by the Observatories. The installation of the new 17–24 in. Schmidt telescope which has replaced the Huggins refractor is almost complete, and the telescope is being tested and adjusted. Among the programmes of work proposed for this instrument, an immediate one is the examination and identification of radio sources. The construction of the new 36-in. reflector is continuing, and the firm of Sir Howard Grubb, Parsons and Co. estimates that delivery should take place this autumn.

Solar work is primarily concerned with the problem of the structure of the outer layers of the sun, and in the new solar tunnel Drs. von Klüber and Suemoto have applied a Fabry–Perot interferometer to the measurement of profiles of well-isolated Fraunhöfer lines (in the wave-length region 6200–6400 A.) between the centre of the solar disk and the limb, using a resolving power of about one million. Among other items mentioned, reference may be made to a solar camera of 6 in. aperture and 40 ft. focal length, weighing about 100 lb. with power supplies included, which has been designed by Drs. D. E. Blackwell and D. W. Dewhirst. It is intended to be carried by a balloon to a height of 60,000 ft. or more, and should turn automatically towards the sun, focus itself and take a series of photographs in practically perfect seeing with the theoretical resolution of a 6-in. telescope. Tests are now being carried out with the camera swinging on a rope attached to a mast, and later tests may be made with the use of a helicopter.

---

* Scientific Research and Development in American Industry: a Study of Manpower and Costs. Bulletin No. 1148 of the Bureau of Labor Statistics, U.S. Department of Labor. (Washington, D.C.: Government Printing Office, 1953.) 50 cents.

The 15° Selected Areas programme of *pg* and *pv* magnitudes of 1,268 stars, measured photographically and in part also photoelectrically, has been ready for printing since early in the year; but some delay has arisen from the difficulty in finding funds for publication.

Dr. E. H. Linfoot has made an analytical determination of the optimum aberration balancing in aplanats and in astigmats when optical performance, including chromatism, is assessed on the basis of a root mean square criterion of image quality. An account of this work is appearing in his forthcoming book, "Recent Advances in Optics" (Oxford: Clarendon Press). Dr. G. Merton's trials at the Oxford University Observatory of the reconstructed two-plate Schmidt–Cassegrain camera of 8 in. aperture have proved very successful, the smallest fully exposed stellar images being about 15 μ in diameter.

During the year 119 lectures were given by the director, Prof. R. O. Redman, and four other members of the staff, and the Observatory Club held twelve colloquia. The list of published papers includes "A Comparison of the Intensities of Infra-Red and Violet Radiation from the Solar Corona at the Eclipse of 1952 February 25" (*Mon. Not. Roy. Astro. Soc.*, 112, No. 6, 652; 1952), by D. E. Blackwell; "Den Totale Solformørkelse Den 25 Februar 1952" (*Nordisk Astro. Tidsskr.*, No. 1, 1953), by H. von Klüber; and "The Continuous Spectrum of a Prominence observed at the Total Solar Eclipse of 1952 February 25" (*Proc. Kon. Ned. Ak. Wet.*, 55, 598; 1952), by R. O. Redman and H. Zanstra.

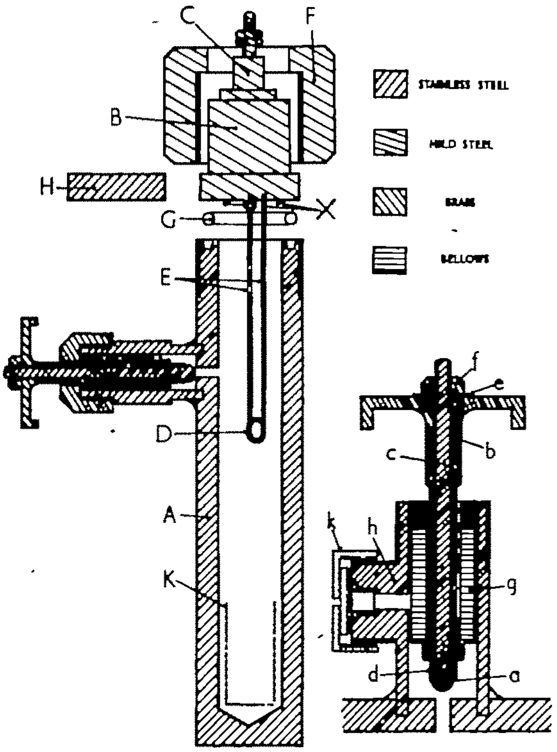
ASSAY OF TRITIUM-LABELLED SUBSTANCES: A 'COMBUSTION BOMB' METHOD OF PREPARATION OF GAS FOR COUNTING

By P. R. PAYNE and J. DONE

Human Nutrition Research Unit, Medical Research Council Laboratories, Holly Hill, Hampstead, London, N.W.3

THE estimation of tritium, using the gases generated by the reaction of 'active' water with aluminium carbide as the filling for a proportional gas counter, has been described by White, Campbell and Payne[1]. A method has now been developed which enables the gas to be prepared from tritium-labelled substances in about one hour. Combustion of the samples is effected in oxygen under pressure, in a metal bomb, in which the gas mixture used for counting is afterwards generated.

The combustion bomb is illustrated in Fig. 1, and consists of a body *A* and head assembly *B*, *F*. The body is a cylindrical vessel of stainless steel ('Staybright FMB' supplied by Messrs. Firth Vickers) turned from the solid (internal diameter 0·937 in., external diameter 1·625 in. and internal length 7·125 in.).



Brazed to the body is a valve, consisting of a stainless steel ball *a*, and a seat, machined in the side of *A*. The ball is moved by the threaded brass sleeve and knob *b*. One end of *b* bears against the cup *d*, and the other against the washer *e*. A self-locking nut *f* is screwed on to the end of the non-rotating shaft *c*. The sleeve and shaft are enclosed by the metal bellows *g*, which forms a gas seal.

The valve outlet is threaded to receive a standard hand-tightened vacuum connector, and is covered by the cap *k*, when the bomb is heated in steam.

The head consists of a block *B*, into which is screwed a diesel engine heater plug *C* (*KLG* type 737). The plug filament, *D*, is mounted on two monel metal rods, *E*, 4·5 in. in length. The block *B* is brazed to the end of the heater plug at *X*, and the inner face of the unit is chromium plated. *B* is clamped to *A* by the screwed collar *F*, and the silicone-rubber ring *G* forms a gas seal. *B* is replaced by a stainless steel disk, *H*, during evacuation and gas generation.

The sample, the size of which is adjusted to yield about 300 μl. of water, is attached to the filament as described below. The body *A* is dried immediately before use in an oven at 105° C., and while it is still hot, *B* is placed in position and secured by the collar *F*. Oxygen is then introduced to a pressure of 250 lb. per sq. in. The bomb is inverted and current passed through the filament to ignite the sample. The lower part of the bomb is cooled for 5 min. in a 'dry-ice' – propanol mixture, after which the pressure is released. The head is removed, a glass tube containing 3 gm. of aluminium carbide is introduced, and the body is sealed with the disk *H*. The pressure in the bomb is reduced to less than $1 \cdot 5 \times 10^{-2}$ mm. mercury, the valve is closed, and the outlet covered by the cap *k*. The gas for counting is now generated by heating the bomb for 30 min. in a domestic pressure cooker at 20 lb. per sq. in. Finally,

* Errors shown are standard errors calculated from three determinations.

† f = isotope dilution, or water equivalent of the material.

the bomb is cooled in tap water, and the gas transferred to the counter tube[1].

Attention has been given to the assay of substances separated on filter paper by chromatography and electrophoresis, since these methods are very useful in work with small samples, such as are obtained from experimental animals.

The paper carrying the sample is folded, and wrapped around the filament *D*, and held in position by a loop of tungsten wire. Samples in powder form (for example, dried tissue) are enclosed in cigarette paper, and similarly attached to *D*. Materials ignited in this way yield clear water after combustion, with no visible traces of carbon. Similar samples held in a crucible, on the filament, were found to be incompletely oxidized.

The results of the first series of tests shown in the accompanying table are the activities of gas, generated in the manner described, from 300-μl. amounts of dilutions of standard active water. It was found that the same isotope dilution occurred when the standard was diluted with water produced by combustion of filter paper (Exp. 2). Samples of the types of paper used in assays were burned, together with added amounts (40 μl.) of standard, in order to determine their isotope dilution (*f* in Exp. 3). Whatman No. 3 *MM* filter paper was dried to constant weight in a current of hot air before combustion.

The tritium-labelled DL-leucine, used in Exp. 4, was prepared by reduction of ethyl 2-acetamido-2-carbethoxy-4-methyl-pentanoate, by adaptation of the method of Albertson and Archer[2]. It is hoped to publish details of this preparation later.

A rat (230 gm.) was given 47 mgm. (7 μc.) of the DL-leucine (dissolved in 1·2 ml. water by addition of the minimum amount of sodium carbonate) by intraperitoneal injection. The animal was killed after 16 hr., a sample of blood collected, and portions of skeletal muscle were dried in a vacuum desiccator. Serum protein fractions (Exp. 5) were obtained by electrophoresis of 97-μl. samples on Whatman 3 *MM* paper. Naphthalene black was used for locating the fractions. Results are given in the table of assays of the albumin, and the most prominent of the globulin fractions, and also a 'blank' sample of the paper immediately in front of the albumin. The skeletal muscle had a lower specific activity than the substances described above, and it was necessary to combust larger amounts. The dried tissue was enclosed in cigarette paper, as previously described. The observed count-rates of the muscle must be corrected to allow for the isotope dilution due to the small amount of paper present. If the correction is made on a weight-for-weight basis, a small error is involved (1·8 per cent and 2·3 per cent in this case), due to the unknown isotope dilution of the muscle. Accordingly, 74 mgm. of muscle was combusted with 409 mgm. of filter paper of known isotope dilution (Whatman 3 *MM*), and a count-rate of 20·9 counts/sec. was observed. This result, in conjunction with the observed count-rates of the 462-mgm. and 381-mgm. samples, respectively, led to the estimates of isotope dilution and activities given in the table.

The simplicity of this method, together with the satisfactory results from the range of materials assayed, indicates that it will be very suitable for routine use.

We would like to thank Prof. B. S. Platt for his interest in this work, and Mr. C. Brown for constructing the apparatus and for valuable suggestions as to its design. [April 12.

NARCOTICS AND BRAIN RESPIRATION

By Dr. J. J. GHOSH* and
Prof. J. H. QUASTEL, F.R.S.

Research Institute, Montreal General Hospital, Montreal

It is now well known that narcotics at low concentrations exercise much larger inhibitory effects on the respiration of stimulated nerve than on that of the unstimulated preparation. Bronk and Brink[1] have shown that the rate of oxygen uptake of resting frog nerve is reduced 15 per cent by 2 m*M* chloretone, but that the increment in the rate of oxygen uptake by nerves carrying impulses at the rate of 50 impulses/sec. is decreased 50 per cent by the same quantity of narcotic. McIlwain[2] has demonstrated that narcotics, such as the barbiturates and chloral, inhibit the respiration of electrically stimulated slices of cerebral cortex at concentrations that have but little perceptible effect on the respiration of the unstimulated tissue. He has also shown[3] that stimulation of the respiration of cerebral cortex by potassium ions and by 2 : 4-dinitrophenol renders the respiration more sensitive to the action of barbiturates and chloral. Buchel[4] has pointed out that removal of calcium ions has effects on brain cortex respiration and narcotic sensitivity similar to those due to excess potassium ions.

It is the purpose of this article to describe further results bearing on the sensitivity of brain cortex *in vitro* to narcotics, under conditions where brain metabolism has been affected by the presence of potassium ions and 2 : 4-dinitrophenol. The narcotics examined include luminal (phenylethyl barbiturate), pentothal, chloretone and ethanol.

Experimental procedure. The experimental work was carried out using the conventional Warburg manometric apparatus. Rat brain cortex was largely used in the experiments to be described; but guinea

Vessel contents: slices of rat brain cortex (approximately 90 mgm. fresh tissue) in 3 ml. Ringer–phosphate–glucose (0·01 *M*) medium, containing additions shown in table. The respiratory activities cited are those obtained thirty minutes after addition of the narcotic

pig cortex has also been used with similar results. The animals (body weight 150–250 gm.) were killed by decapitation, the brains removed and cortex sections cut with a Stadie–Riggs slicer. The slices were weighed wet immediately and dry weight calculated by a factor determined by drying a known quantity of wet tissue to constant weight at 110°. The slices (average 90 mgm. wet weight) were allowed to respire at 37° in oxygen in a medium of the following composition: NaCl, 128 m*M*; KCl, 5 m*M*; $CaCl_2$, 0·6 m*M*; $MgSO_4$, 1·3 m*M*; KH_2PO_4, 1·3 m*M*; Na_2HPO_4, 10 m*M*, brought to *p*H 7·4 with *N* HCl. The medium contained glucose (0·01 *M*) except when otherwise stated.

Carbon dioxide liberated during respiration was absorbed by potassium hydroxide in the centre wells of the manometric vessels.

A solution of the narcotic or of potassium chloride (or 2 : 4-dinitrophenol) or of a mixture of both was usually placed in the side tube of the manometer vessel, and was tipped into the medium containing the brain cortex slices when the respiration of the latter had obtained a constant rate, usually about thirty minutes after the commencement of the experiment. Readings of the rate of oxygen consumption were then taken every ten minutes for one hour.

Effects of luminal, pentothal and chloretone on rat brain cortex respiration in presence of added potassium ions. The considerable increase in respiratory activity of brain cortex due to the addition of 0·1 *M* potassium chloride[4] is seen in typical results given in Table 1. The presence of luminal brings about an enhanced inhibition of the rate of respiration in presence of 0·1 *M* potassium chloride, the increase of inhibition above that obtained in absence of potassium chloride amounting to more than 90 per cent at a concentration of 0·0017 *M*. A similar phenomenon is observed when chloretone is used as the narcotic. These results are in accord with those reported by McIlwain[5]. Although the percentage inhibition of the rate of respiration, in absence of the added potassium ions, is directly proportional to the amount of narcotic present, this is not the case in the presence of 0·1 *M* potassium chloride. Here, the increase of inhibition of respiration falls off as the amount of narcotic is increased. Similar conclusions apply to chloretone when this is used at low concentrations (Table 1).

As an example of a barbiturate that has been claimed[6] to exert its effects by uncoupling of phosphorylation and not by oxidative inhibition, pentothal may be cited. This narcotic, which has little or no inhibitive effect at low concentrations on the respiration of brain cortex *in vitro* and may even show a stimulation, is a potent inhibitor, at the same concentrations, when the brain cortex is stimulated by potassium ions. Typical results may be seen in Table 1. The inhibitive effect of this narcotic increases with its concentration, and it has not been observed to give a stimulation with brain cortex in presence of 0·1 *M* potassium chloride, such as may occur with brain cortex in absence of added potassium ions. Conceivably, the stimulation shown by low concentrations of pentothal with brain cortex in the absence of added potassium ions is due to an oxidation of, or a catalysis by, the thiol group of this narcotic.

While these results make it apparent that brain cortex respiration is made much more sensitive to the inhibitive action of narcotics by the presence of 0·1 *M* potassium chloride, another conclusion, not hitherto commented upon, may be drawn from them. The data of a number of representative experiments given in Table 2 make it clear that the presence of the narcotic greatly diminishes the stimulating action of added potassium ions. Thus, whereas the average increase of the respiratory rate of rat brain cortex in a glucose–phosphate medium due to the addition of 0·1 *M* potassium chloride amounts to 70 per cent during the first half-hour after addition of the salt, the increase only amounts to 12 per cent when 0·0033 *M* luminal is present. In no case has it yet been observed that the addition of luminal (or pentothal or chloretone) reduces the rate of respiration of rat brain cortex in presence of 0·1 *M* potassium chloride below that found in the absence of added 0·1 *M* potassium chloride. If the effect of added potassium ions is simply to render the brain cortex more sensitive to the action of the narcotics, it would be expected that respiratory rates *lower* than those found in the absence of added potassium would be found. We have not yet found this to occur. The results, in fact, indicate that the inhibitive action of the narcotic at low concentrations is *restricted* to that

Table 2. EFFECTS OF LUMINAL ON RAT BRAIN CORTEX RESPIRATION IN PRESENCE OF POTASSIUM CLORIDE

Vessel contents: conditions as in Table 1 except that glucose is replaced by other substrates. Respiratory activities recorded are the average over the first 30 min.

aspect of brain cortex metabolism which is stimulated by potassium ions. Another way of expressing the same result is to state that the stimulating action of potassium ions mainly operates on that aspect of brain cortex metabolism which is inhibited by narcotics at low concentrations.

The stimulating effect of the presence of 0·1 M potassium chloride on brain cortex respiration is seen not only with glucose as combustible substrate but also with fructose, sodium pyruvate and sodium lactate[4]. With all these substrates, the increased effect of the narcotic in diminishing the respiration stimulated by potassium chloride is observable. Typical results with chloretone (0·0033 M) are shown in Table 3. It will also be observed that there is but little stimulating effect of the added potassium ions on the respiration of brain cortex in presence of fructose, lactate or pyruvate when the narcotic is also present.

When sodium L-glutamate is present as substrate in place of glucose, no stimulating effect of added potassium on the respiration is found[6] nor is the narcotic effect increased (Table 3). Moreover, when sodium succinate is present as substrate, neither stimulation of the rate of respiration by added potassium ions nor increased sensitivity of the respiration to the narcotic, within the experimental error of these observations, is observable (Table 3).

A fact supporting the conclusion that both the inhibitive activity of narcotics and the stimulating effect of potassium ions are directed to the same aspect of brain respiration is the observation that homogenized brain tissue in presence of glucose has a respiration which is neither stimulated by 0·1 M potassium chloride nor inhibited by low concentrations of narcotics.

A possible explanation of these results is that the presence of high concentrations of potassium ions catalyses the processes of formation of energy-rich phosphates, such as adenosine triphosphate[7], which in turn enhance the rates of oxidation of glucose or pyruvate[8]. Granting these facts, and the correctness of the conclusion that narcotics at low concentrations block oxidative synthesis in the brain of adenosine triphosphate[9] and pyruvate oxidation[10], it is apparent that, in the presence of narcotics, the stimulating effect of potassium ions will be reduced or eliminated. It follows, too, if this view is correct, from the results given in Tables 2 and 3 that a considerable fraction of the respiration of brain cortex is neither narcotic-sensitive (for low concentrations of narcotics) nor responsive to the presence of high concentrations of potassium ions.

It is of considerable interest in this connexion to recall the observations of Lipsett and Crescitelli[6], who have shown that the potassium stimulation of oxygen uptake by rat brain is inhibited by the addition of 0·01 M citrate, α-ketoglutarate, L-glutamate or succinate. The suggestion made by the authors is that these substances (the oxidation of which is not stimulated by 0·1 M of potassium chloride) yield large amounts of high-energy phosphate during their metabolic breakdown. It is, however, also possible that these substances, by competition with glucose or pyruvate for common carriers in brain respiration, may have sparing effects on the utilization of glucose or pyruvate and thus diminish the potassium stimulation. This is obviously a matter for further investigation. Reference should also be made to the work of Kimura and Niwa[11], who have shown that the potassium stimulation of brain cortex respiration is inhibited by malonate, which has relatively little effect on the unstimulated respiration. This would indicate that the narcotic-sensitive respiration is also highly malonate-sensitive, a fact which is consistent with the conclusion that the stimulated phase involves the oxidation of carbohydrate (or pyruvate) through the operation of the citric acid cycle.

Effects of luminal, pentothal and chloretone on rat brain cortex respiration in presence of 2 : 4-dinitrophenol. The increased respiration of rat brain cortex in presence of 2 : 4-dinitrophenol ($2·5 \times 10^{-5}$ M) is, like that due to excess potassium ions, highly sensitive to the inhibitory action of narcotics. Typical results are shown in Table 1 and are in agreement with the results of McIlwain[3] obtained with guinea pig brain. Again, it is clear that in the presence of small concentrations of narcotics the stimulatory effect of 2 : 4-dinitrophenol is greatly reduced. A comparison of the effects of potassium ions and of 2 : 4-dinitrophenol on rat brain cortex respiration is given in Table 4.

An explanation similar to that given for the results with 0·1 M potassium chloride may apply to those obtained with dinitrophenol. Recent evidence[11] makes it likely that the accelerative effects of 2 : 4-dinitrophenol are due to an increase in the rate of breakdown of adenosine triphosphate to adenosine diphosphate, which by acting as phosphate acceptor serves to stimulate oxygen uptake. Here again, if the narcotic blocks oxidative synthesis of adenosine

Table 4. EFFECTS OF POTASSIUM IONS AND OF 2 : 4-DINITROPHENOL ON RESPIRATION OF RAT BRAIN CORTEX IN PRESENCE OF NARCOTICS

System	Per cent increase of respiration due to KCl (0·1 M)	Per cent increase of respiration due to DNP ($2·5 \times 10^{-5}$ M)
Glucose only	55	55
Glucose + luminal 1·7 mM	10	15
Glucose + luminal 3·3 mM	5	8
Glucose + chloretone 1·4 mM	10	12 to 15
Glucose + chloretone 2·8 mM	4	10
Glucose + ethyl alcohol 0·02 M	15	10
Glucose + ethyl alcohol 0·2 M	10	8
Glucose + ethyl alcohol 0·4 M	7	Nil

The values given in this table refer to respiratory activities calculated during the 30–60 min interval of the experiment

triphosphate, the stimulatory action of 2 : 4-dinitrophenol will be reduced or eliminated.

Ethanol as a narcotic. It is known[13–15] that brain tissue is capable of oxidizing ethanol when this is present in small concentrations, and possibly this fact has made it difficult to study narcotic effects of ethanol *in vitro*. Depression of brain metabolism *in vivo* by ethanol has been observed[16,17].

Results given in Table 5 and Table 6 show that the addition of ethanol at small concentrations to rat brain cortex slices respiring in a glucose–phosphate medium brings about an increase in the rate of respiration, the increase being diminished with increase of ethanol concentration (see also Buchel[3]).

Ethanol, however, even at the lowest concentration tested (0·02 *M* ≡ 92 mgm. per cent) exercises a definite inhibition of rat brain cortex respiration in presence of 0·1 *M* potassium chloride. As will be seen from the results given in Table 5, the presence of ethanol brings about inhibitions of the stimulated respiration of rat brain cortex that increase with increase of ethanol concentration. The same phenomenon holds with 2 : 4-dinitrophenol-stimulated respiration of rat brain cortex (Table 6). These observations indicate that ethanol behaves in a manner similar to luminal or pentothal or chloretone on the stimulated respiration of rat brain.

It is likely, though not yet proved, that the increase of respiration of unstimulated rat brain due to the addition of small concentrations of ethanol is due to oxidation of the ethanol itself, and that such increase is obscured by the stimulation of oxidation that occurs in a glucose medium in presence of 0·1 *M* potassium chloride or of 2 : 4-dinitrophenol.

In the light of these results it would appear that narcotics, at pharmacologically active concentrations, exercise large inhibitive effects on the total respiration of the stimulated nerve cell by suppressing that aspect of respiration capable of response to the presence of high concentrations of potassium and which is concerned with carbohydrate (or pyruvate) oxidation. With the resting, unstimulated, nerve cell the respiration is due to processes a considerable proportion of which are neither highly sensitive to narcotic nor capable of stimulation by potassium ions. It is for this reason that apparently so little effect on the respiration of the unstimulated nerve *in vitro* is seen by a narcotic at pharmacologically active concentrations. With stimulated nerve, however, the potassium-responsive, narcotic-sensitive, aspect of respiration becomes the more prominent phase.

The general conclusion that narcotics, at pharmacologically active concentrations, act on the nerve cell, where they are adsorbed, by the suppression of oxidative events, particularly those involved in glucose or pyruvate oxidation, is thus supported.

Summary

The increased respiration of rat brain cortex *in vitro*, brought about by addition of potassium ions or of 2 : 4-dinitrophenol, is suppressed or eliminated by the presence of pharmacologically active concentrations of barbiturates, such as luminal or pentothal, or of chloretone. The increased sensitivity of the respiration of stimulated brain cortex to narcotics is due to a retarding effect of the narcotics on a specific phase of nerve respiration that is potassium-sensitive and concerned with glucose (or pyruvate) oxidation. This phase is not prominent in a resting, unstimulated, nerve, the respiration of which is made up largely of processes that are unresponsive to potassium or insensitive to low concentrations of narcotics. This phase, however, becomes an important aspect of the respiration of stimulated nerve. The presence of ethanol at low concentrations (0·1 per cent) brings about a decided inhibition (20 per cent) of the respiration of rat brain cortex stimulated by potassium or by 2 : 4-dinitrophenol. The same concentration of ethanol increases the respiration of unstimulated brain cortex probably by undergoing an oxidation, which is obscured by the stimulation of respiration in a glucose medium by the addition of potassium ions or of 2 : 4-dinitrophenol.

Fractionation of Deoxyribonucleoprotein by Successive Extraction with Constant Salt Concentration

IN recent papers Chargaff and his collaborators[1], and Brown and Watson[2], have shown the possibility of obtaining nucleic acids (DNA) of varying composition from deoxyribonucleoprotein. Chargaff's fractionation was achieved by successive extractions of nucleoprotein with salt solutions of increasing strength, after the nucleoprotein had been precipitated by a mixture of chloroform and *n*-octanol. This yielded a series of nucleic acid fractions containing progressively increasing quantities of adenine and thymine. Chargaff has suggested that this fractionation may arise from the existence of bonds of varying stability, between the protein and the nucleic acid, which are broken progressively with increasing salt concentration. It may be noted that in the observations quoted, although fractions of differing composition were undoubtedly obtained, there were marked irregularities in the way in which the composition of the fractions varied with the salt concentration used in extraction. This suggested to us that some other variable may have had a significant effect on the results obtained.

Attempts were made to fractionate nucleoprotein directly, without prior chloroform treatment; and by slowly adding or removing salt by dialysis, to obtain fractional solution and precipitation respectively of the nucleoprotein. Though the nucleoprotein was fractionated into soluble and insoluble material at salt concentrations of both 0·65 *M* and 0·75 *M* by this means, the nucleic acids thus obtained showed no significant differences in composition.

We then investigated the result of extracting the chloroform-denatured nucleoprotein successively with the same salt solution. Fresh, minced calf thymus glands were washed five times with 0·9 per cent sodium chloride, homogenized in water, and then mixed with an equal volume of chloroform (35 parts) and amyl alcohol (10 parts) for five minutes in a Waring blendor. The gel obtained on centrifugation at 20,000 *g* was blended into excess 0·6 *M* sodium chloride for one minute, and the extract stirred slowly overnight. After centrifugation at 32,000 *g* for three hours, the viscous supernatant liquid was decanted, precipitated with alcohol, and protein removed from the material to yield the nucleic acid. The residue, partly compact and partly gel-like, was then extracted further with 0·6 *M* salt solution as above. All operations, except deproteinization, were performed at temperatures below 5° C. In experiment I, protein was removed by treatment with chloroform and amyl alcohol in 10 per cent salt solution[3], whereas in experiment II protein was removed by a detergent method[4]. A small dilution of the sodium chloride by the water present in the gel occurs in the first extraction; but in subsequent extractions this is negligible.

We are able to extract successive nucleoprotein fractions by the above procedure, and the deoxyribonucleic acids obtained in these extractions have been found to vary progressively in composition, as can be seen from the results of the two experiments given in Table 1. In experiment II, more than 50 per cent of the total salt-soluble phosphorus was extracted in five successive extractions.

Each value of (adenine + thymine)/(guanine + cytosine) is the mean of three determinations on one perchloric acid hydrolysate of the substance[5]. No individual value differed from the mean of the three by more than 3 per cent (except fraction II 1), and the average difference from the mean value was less than 2 per cent. Fractions I 2 and II 2 were hydrolysed in duplicate and the mean values differed by only 1 per cent in each pair of hydrolysates.

In the first two extracts of both I and II, the nucleoprotein as precipitated by alcohol was largely non-fibrous, and precipitation required several hours at about 4° C., whereas the later extracts immediately gave the usual fibrous precipitate. The specific viscosities of the isolated nucleic acid fractions did not vary greatly, though all were lower than that of thymus deoxyribonucleic acid ($\eta_{sp}(P) = 1,045$), in which protein had been removed with chloroform/amyl alcohol in 10 per cent salt solution.

There is no doubt that the chloroform-treated nucleoprotein is in a different state from the native material. Extracts of the denatured material in 0·6 *M* salt solution after precipitation with alcohol yield nucleoprotein soluble in 10 per cent salt solution, whereas material extracted similarly from the native nucleoprotein and precipitated with alcohol is insoluble in 10 per cent salt solution[6].

Table 1. COMPOSITION OF CALF THYMUS DEOXYRIBONUCLEIC ACID FRACTIONS

Experiments	Fraction	Sodium chloride molarity	% of total[b] soluble phosphorus	N/P[b]	$\eta_{sp}(P)$[c]	$\frac{\text{Adenine}}{\text{Thymine}}$	$\frac{\text{Guanine}}{\text{Cytosine}}$	$\frac{A+T}{G+C}$
I	1	0·6				1·08	1·14	0·88
	2					1·24	1·17	0·88
	3					1·05	1·10	1·16
	4					1·07	1·12	1·21
II	1	0·6	2·5	25·0	—	0·99	1·13	0·76[d]
	2		4·6	5·4	727	1·09	1·18	0·85
	3		12·9	4·2	880	1·07	1·14	1·06
	4		18·0	3·8	984	1·06	1·11	1·20
	5		18·5	3·8	898	1·04	1·08	1·30
	Residue[a]		43·5	3·5	955	1·03	1·13	1·31
Unfractionated deoxyribonucleic acid (chloroform deproteinization, ref. 3)						1·07	1·06	1·20
Unfractionated deoxyribonucleic acid (detergent deproteinization, ref. 4)						1·01	1·18	1·22

a, The residue in II was extracted in 10 per cent sodium chloride solution.
b, Total phosphorus and nitrogen was determined in each salt extract.
c, $\eta_{sp}(P)$ is the specific viscosity (Ostwald type viscometer) of the deoxyribonucleic acid divided by the molarity of the solution with respect to phosphorus. Solutions were 0·1 per cent deoxyribonucleic acid in 0·1 *M* sodium chloride. Outflow time for 0·1 *M* sodium chloride was 13·2 sec. at 25° C.
d, Fraction II 1 accurate to within 5 per cent.

It can be concluded that whatever is the actual process that gives rise to the fractionation, the essential variable is not the concentration of sodium chloride in the extracting solution. The nitrogen/phosphorus ratios of the extracted nucleoprotein fractions given in Table 1 show that the ratio protein/nucleic acid decreased in the successive extractions. But the excess of protein extracted in the early fractions may have been extraneous, and not closely associated with the deoxyribonucleic acid. However, the fractionation of the deoxyribonucleic acid might possibly be a consequence of the fact that a high protein/deoxyribonucleic acid ratio occurs in those fractions which are richer in guanine and cytosine.

We wish to thank Miss P. Simson for phosphorus and nitrogen analyses. One of us (J. A. L.) holds a Gordon Jacobs fellowship of the Royal Cancer Hospital. This investigation has been supported by grants to the Royal Cancer Hospital and Chester Beatty Research Institute from the British Empire Cancer Campaign, the Jane Coffin Childs Memorial Fund for Medical Research, the Anna Fuller Fund, and the National Cancer Institute of the National Institutes of Health, U.S. Public Health Service.

Effect of Hæm-linked and Other Ionizations on Hæmoprotein Reactions

THE ionization of a proton from a 'hæm-linked' acidic group, generally believed to be on the amino-acid residue to which the hæm is attached, is known to alter the affinity of the iron atom for a ligand, as in the combination of the ferrous hæmoprotein, hæmoglobin, with oxygen (Bohr effect)[1]. If a similar effect operates in the formation of ferric hæmoprotein complexes, then it may be very difficult to decide, from the variation with *p*H of equilibrium or of velocity constants, or from determinations of the *p*H changes which accompany complex formation in unbuffered solutions, whether complexes formed with ligands possessing acid-base properties contain the undissociated ligand, HX, or its anion, X^-, bonded to the iron atom[2]. However, a knowledge of the acid strengths of hæm-linked groups, obtained from reactions where the effect of *p*H comes entirely from their ionizations, such as the oxygenation and electrode reactions, does enable a definite choice to be made. In this way we have recently shown[3] that the fluoride and cyanide complexes of the ferric hæmoprotein, metmyoglobin, involve bonding of fluoride and cyanide ions.

But in the case of the hæmoprotein enzymes, catalase and peroxidase, the simplest interpretation of the scanty data on the variation of equilibrium and velocity constants with *p*H suggests bonding of the undissociated ligands HF, HCN, HN_3, etc.[4]. Yet the physical properties of the complexes, particularly absorption spectra and magnetic susceptibilities, resemble so closely those of metmyoglobin and methæmoglobin that on these considerations alone anion bonding has long been accepted[4]. One explanation of the apparent contradiction could be that anions are bonded in all the complexes, but in metmyoglobin reactions the ionization of a hæm-linked group only slightly modifies the *p*H variation of equilibrium and velocity constants indicative of anion bonding, whereas the *pK* values of the linked ionizations in catalase and peroxidase are such as to alter it completely.

In addition to the effect of a hæm-linked group, the ionization of other acidic groups on the hæmoprotein would be expected to influence the reactivity of the iron atom by altering the 'ionic strength charge' (Z)[5]. Such an effect should be most readily detectable at very low ionic strengths (I), where the magnitude of the charge could be obtained from the variation of an equilibrium or velocity constant with $\sqrt{I}$. The effect would probably be a composite one since every charged group would exert an influence depending, among other factors, upon its distance from the iron atom and upon the dielectric constant of the medium between (which might be low like that of the backbone chain of a polypeptide, or high like that of polar side-chains or solvent water molecules). On the same basis, the charge on a hæm-linked group should also contribute to the value of Z.

We have obtained values for the changes in Z for three metmyoglobin reactions[6,7]. In the table these values are given to the nearest whole number, together with the corresponding changes in the 'formal charge' on the iron atom, which is usually taken as + 1 in metmyoglobin on the grounds that two of the three positive charges are neutralized by negative charges on pyrrollic nitrogen atoms of the porphyrin ring. The table shows that at *p*H values between 6·6 and 7·5, where the hæm-linked group[3] is predominantly ionized in metmyoglobin ($pK \sim 6{\cdot}0$) and in its fluoride complex ($pK \sim 6{\cdot}4$), the change in both quantities is from + 1 to zero as the complex forms. Determinations of the *pK* of the linked group on the fluoride complex, from the slight increase in the intensities of its absorption bands over the *p*H range 5·8–6·7, also indicate that Z changes from + 1 to zero in this reaction[7]. Although this ionization does not involve any change in the formal charge on the iron atom, provided the hæmatin group and its linked acidic group are considered as one unit, this result is consistent with the previous one, and can be readily accounted for by the ionization of a cationic acid, for example, the glyoxalinium NH^+ of histidine.

CHANGES IN CHARGE ACCOMPANYING METMYOGLOBIN REACTIONS. $Fe^+(H_2O)$ represents the ferric iron atom in metmyoglobin with its co-ordinated water molecule. H^+Y and Y represent, respectively, the conjugate acidic and basic forms of a hæm-linked group with the charge assigned arbitrarily

Metmyoglobin reaction	Formal charge on Fe	Ionic strength charge (Z) (nearest whole number)
$Y.Fe^+(H_2O) + F^- \rightleftharpoons Y.FeF + H_2O$ at *p*H values between 6·6 and 7·5 (ref. 7)	+ 1 → 0	+ 1 → 0 in range of $I = 0{\cdot}01$–$0{\cdot}10$
$H^+Y.FeF \rightleftharpoons Y.FeF + H^+$ from *p*H 5·8 to 6·7 (ref. 7)	0 → 0	+ 1 → 0 in range of $I = 0{\cdot}025$–$0{\cdot}10$
$Y.Fe^+(H_2O) \rightleftharpoons Y.FeOH + H^+$ from *p*H 8·5 to 9·4 (ref. 6)	+ 1 → 0	− 2 → − 3 in range of $I = 0{\cdot}002$–$0{\cdot}010$

But a more complicated co-operative effect cannot be excluded. For example, the ionization may be that of a carboxylic acid where the influence of the negative charge of the carboxylate ion is compensated for by the positive charge of a cationic acid. In this connexion the ionization of the two propionate side-chains of the ferriprotoporphyrin merit consideration, particularly in view of J. Keilin's observations on copper uroporphyrin[8], where a $pK \sim 5 \cdot 7$ was obtained from the change in absorption spectrum with pH, a probable consequence of the ionization of the acetate and propionate side-chains. Preliminary estimates[7] of the heat and entropy of ionization of the hæm-linked group in metmyoglobin, obtained from the variation of pK with temperature at $I = 0 \cdot 10$, give $\Delta H^{\circ} = 2 \pm 2$ kcal.mole^{-1} and ΔS° about -20 e.u., which more closely resemble the thermodynamic constants for the ionization of a carboxylic acid than those for the NH$^+$ of histidine.

Whereas in the pH range 6·6–7·5, which spans the isoelectric point, it is not apparently necessary to invoke a charge contribution from acidic groups other than the hæm-linked group, this is no longer so in the pH range 8·5–9·4, where the ionization occurs of the water molecule co-ordinated to the iron. Here the change in formal charge is again $+1$ to 0, but the corresponding values of Z are -2 and -3 (see table). This suggests that between pH 7·5 and 8·5 the equivalent of three negative charges has been produced, and as carboxyl groups are unlikely to become ionized in this range, the effect is probably due to the ionization of cationic acids the positive charges of which otherwise compensate for the effect of the negatively charged carboxylate ions. Depending on the extent to which the two propionate side-chains of the ferriprotoporphyrin contribute to this charge, the equivalent of between one and three acidic amino-acid residues (aspartic or glutamic[9]) will also be needed. The cationic acids may include glyoxalinium NH$^+$ groups of histidine, or the α-NH$_3{}^+$ of the terminal glycine in metmyoglobin[10].

It is significant that although these three negative charges contribute to the value of Z, and as a consequence influence the reactivity of the hæmatin iron atom, the ionization of the groups concerned does not apparently alter the affinity of the iron for fluoride at high ionic strengths[7]. In this respect, the ionizations can be differentiated from the hæm-linked ionizations with which the Bohr effect is associated, and the contrast in behaviour substantiates the idea that some special structural or configurational feature must be present before an ionization can have the properties which characterize a hæm-linked ionization.

Biosynthesis of Hæmin in Soy-bean Nodule Homogenates

IT has been shown that root nodules of leguminous plants contain a hæmoprotein with a prosthetic group indistinguishable from protohæmin IX of hæmoglobin[1]. Elucidation of the mechanism of formation of this pigment in plant material should broaden our knowledge of biosynthetic reactions leading to the formation of porphyrins, and make it possible to compare hæmin synthesis in plant and animal tissues.

The work to be reported was carried out with soy-bean root nodules harvested from plants approximately six weeks of age. 5-gm. portions of nodules were homogenized with a Waring blendor in 30 ml. of 0·2 molar phosphate buffer, pH 7·1. The ability of these preparations to incorporate the carbon atoms of glycine and acetate into hæmin was investigated by incubating the homogenates for three and a half hours in modified Warburg vessels at temperatures ranging from 18° to 37° C. in the presence of various substrates. Hæmin was isolated and purified by chromatography on a 'Celite' column, and identified spectroscopically as the pyridine hæmochromogen of protohæmin IX. In a few cases the pyridine hæmochromogen was converted to its corresponding porphyrin ester according to Grinstein[2] and found to be indistinguishable spectroscopically and by means of column chromatography from that isolated from hæmin IX. Table 1 shows some typical results.

Table 1. INCORPORATION OF THE CARBON ATOMS OF GLYCINE AND ACETATE INTO HÆMIN IN SOY-BEAN ROOT NODULE HOMOGENATES

Test substance	Radioactivity in hæmin*
2-^{14}C-Glycine	38×10^3
1-^{14}C-Glycine	4×10^3
2-^{14}C-Acetate	45×10^3
1-^{14}C-Acetate	38×10^3

* Expressed as disintegrations per mM/min./5 gm. wet weight of nodules/μc. of test substance.

As can be seen from the table, soy-bean root nodule homogenates, like animal tissues[3], are able to incorporate the alpha carbon atom of glycine and the carbon atoms of acetate into hæmin.

Differences between nodule homogenates and animal tissues in their ability to incorporate glycine and acetate into hæmin are presented in Table 2.

The differences between root nodules and bone marrow in their ability to incorporate 1-^{14}C-glycine

Table 2. DIFFERENCES BETWEEN SOY-BEAN ROOT NODULES AND BONE MARROW IN THEIR ABILITY TO INCORPORATE GLYCINE AND ACETATE INTO HÆMIN

Variable observed	Soy-bean root nodules	Bone marrow
Incorporation of 1-^{14}C-glycine	Slight incorporation (approx. 10 per cent)*	No detectable incorporation
Incorporation of 1-^{14}C-acetate	About the same incorporation as of 2-^{14}C-acetate	Less incorporation than of 2-^{14}C-acetate (approx. 60 per cent)†
Effect of 0·01 M sodium fluoride on incorporation of the carbon atoms of glycine into hæmin	Stimulatory (approx. 400 per cent for 1-^{14}C-glycine; approx. 190 per cent for 2-^{14}C-glycine)	Inhibitory (approx. 50 per cent for 2-^{14}C-glycine)
Temperature	Optimum, 25° C.	Optimum, 37° C.

* Expressed as per cent incorporation of 2-^{14}C-glycine.
† Expressed as per cent incorporation of 2-^{14}C-acetate.

and in their response to the presence of fluoride warrant further investigations which are now being undertaken in this laboratory.

This work was performed under contract with the United States Atomic Energy Commission at the University of Rochester Atomic Energy Project, Rochester, New York. One of us (S. C.) wishes to thank the National Cancer Institute of the National Institutes of Health, U.S. Public Health Service, for partial support for this investigation.

Hæmoglobin in *Heterakis gallinae*

A NUMBER of helminths and especially parasitic nematodes are known to possess a hæmoglobin-like pigment[1-4]. In some instances, a detailed study has been made of the pigment after extraction and purification[2,4]. From the discussion in the literature, it is apparent that no general conclusion as to the physiological significance of the hæmoglobin of parasites can be made.

The present investigation adds another nematode, *Heterakis gallinae*, from the cæca of the fowl, to the list of parasites containing hæmoglobin. The following observations were made on adult worms with a reversion spectroscope (Beck–Hartridge): wavelengths in millimicrons.

	Oxyhæmoglobin		Carboxyhæmoglobin		Hæmoglobin	Pyridine hæmochromogen	
	α-band	β-band	α-band	β-band		α-band	β-band
Heterakis	578·2	542	570·0	c. 530	555	557	525
Fowl blood*	578·0	541	571·8	537	556		

* There is a slight difference between our results and those of Anson *et al.*[5]: they give 576·4 as the position of the α-band in man and 576·9 in the fowl. We found, with our spectroscope, in man 577·2 and in the fowl 578·0.

It was noted that the hæmoglobin was rapidly deoxygenated by the respiratory activity of the worm, a fact which is in accordance with the high values of oxygen uptake found by Glocklin and Fairbairn[6].

It appears that there is little difference between the position of the bands of *Heterakis* hæmoglobin and those of the blood of the host.

Nevertheless, the hæmoglobin of *Heterakis* is probably an autochtonous pigment because (1) the absorption bands remained in the same position over a period of 24 hr. in washed parasites which were placed in an incubator at 37° C.; (2) adult *Heterakis* feed on the cæcal content and not on tissues or blood, as is possibly the case in the larval stage since there exists a tissue phase in the developmental cycle[7].

Biological Value of Proteins as Influenced by Dietary Vitamin B_{12}

IT has been shown by Frölich[1] that chicks, fed underheated, low-quality soy bean oil meal, were depleted of their vitamin B_{12} reserves and consequently required the supply of dietary vitamin B_{12}, probably due to the antiproteolytic activity[2] or soyin content[3] of the underheated meal. Baliga and Rajagopalan[4] have reported that vitamin B_{12} at 50 μgm. per kilo of the diet containing 10 per cent raw soy bean protein (without any heat treatment) enhanced the biological value of the protein (the biological values for the raw and vitamin B_{12} supplemented soy bean protein being 48·6 ± 0·9 and 77·6 ± 1·8 respectively). This would suggest that vitamin B_{12} has overcome the adverse effect of the proteolytic inhibitor and soyin. These studies were extended to determine the effect of vitamin B_{12} on the biological value of autoclaved soy bean meal. These observations are presented here.

Cold defatted and autoclaved (at 15 lb. pressure for 30 min.) soy bean meal, at 10 per cent protein-level in the diet, was used for the determination of biological value by the method of Mitchell[5]. There were three comparable groups of albino rats, containing six rats in each group and each rat weighing 80–100 gm. After determining the endogenous nitrogen with 4 per cent egg protein, one group (*A*) was given the basal diet[4] containing the autoclaved soy bean meal, the second group (*B*) was given the same basal diet with vitamin B_{12} at 50 μgm. per kilo of the diet and the third group (*C*) received the basal diet with aureomycin at 200 mgm. per kilo of the diet. The figures for the biological values for the *A*, *B* and *C* groups were 78·30 ± 0·3, 85·40 ± 1·0 and 86·43 ± 1·40 respectively. These data clearly show that vitamin B_{12} has a definite function in increasing the utilization of soy bean protein irrespective of the extent of heat treatment. This observation is contradictory to that of Frölich (*loc. cit.*) who, using chicks, did not find vitamin B_{12} to have any beneficial influence on growth with adequately heated soy bean meal. Our results also indicate that aureomycin exerts a significant increase in the biological value of autoclaved soy bean meal.

It was of interest to find out whether an animal protein, like casein, would respond to vitamin B_{12} in the presence of proteolytic inhibitor and soyin. Each of three more groups of rats received 10 per cent casein in the basal diet in place of soy bean meal. Three lots of crude and active inhibitor preparation were made[6] from soy bean the quantity of which was the same as that which formed the 10 per cent protein-level in the original basal diet. One lot of the inhibitor preparation was inactivated by heat and added to the control group of rats. The other two groups received the active inhibitor preparation. To one of these two groups, vitamin B_{12} was added at a level of 50 μgm. per kgm. of the diet. The following biological values were obtained: casein plus inactivated inhibitor, 86·6 ± 1·14, casein plus active inhibitor, 76·67 ± 0·82, casein plus active inhibitor plus vitamin B_{12}, 85·19 ± 0·98.

In the above case, vitamin B_{12} has just counteracted the influence of the inhibitor and has not shown any extra benefit. Whereas with raw soy bean, elimination of the adverse effects of the inhibitors automatically improves the biological value as evidenced by autoclaving the raw soy bean meal, in the case of the casein inhibitor the removal of the inhibitor effect by vitamin B_{12} has resulted in the restoration of the normal biological value. With a higher concentration of vitamin B_{12} in the diet than used in the present studies, it might be possible to get a higher biological value for casein as reported by Kon and Henry[7]. This aspect is being verified.

Studies on the rate of release of certain amino-acids from raw soy bean under the influence of vitamin B_{12}, and nitrogen balance and growth studies with different levels of autoclaved soy protein with and without vitamin B_{12} and aureomycin, are in progress.

Our thanks are due to Prof. K. V. Giri for his interest in the investigation.

Enzymatic Conversion of Salicylhydroxamic Acid to Salicylamide

After the administration of salicylhydroxamic acid to rats, we have been able to isolate conjugates of salicylhydroxamic acid and salicylamide from the urine[1]. In the intact animal, salicylhydroxamic acid is therefore partly metabolized to salicylamide. In the present communication, the enzymatic transformation of salicylhydroxamic acid to salicylamide *in vitro* is reported.

Rat liver extract (1 ml.), prepared according to Bray *et al.*[2], was incubated with sodium salicylhydroxamate (1 ml., 0·02 *M* in 0·2 phosphate buffer, *p*H 7·4) at 35° C. for various periods. The reaction was stopped by immersing the mixture for exactly three minutes in boiling water, the coagulated protein thrown down by centrifugation and the supernatant investigated by paper chromatography. A descending method, using Whatman No. 1 filter paper and 1·5 *N* ammonium hydroxide : *n*-butanol (1 : 1) as the solvent system, was employed. With this solvent, good separation of salicylhydroxamic acid, salicylic acid, and salicylamide was obtained with R_F values for the three compounds approximately 0·24, 0·41 and 0·52 respectively. When viewed under ultra-violet light, salicylic acid and salicylamide show light blue, while salicylhydroxamic acid shows dark blue, fluorescence. The compounds also give characteristic colours when sprayed with ferric ion. In addition, control spots of the above three compounds were always placed on the paper, since the R_F values tended to vary with changes in temperature.

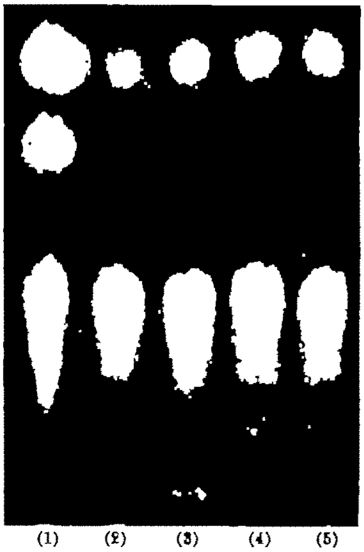

Fig. 1. Chromatogram showing the formation of salicylamide, from salicylhydroxamic acid. 1 : Control spot of salicylhydroxamic acid, salicylic acid and salicylamide; 2, 3, 4 and 5: liver extract and salicylhydroxamic acid incubated for 30, 60, 120 and 240 minutes respectively

The enzymatic transformation of salicylhydroxamic acid to salicylamide could be definitely established by the identification of the latter on the chromatogram (Fig. 1). Samples of liver extract incubated without salicylhydroxamic acid did not show the presence of salicylamide. There was no hydrolysis of salicylhydroxamic acid to salicylic acid, as indicated by the failure to detect the latter by chromatography. Activity was abolished by placing the enzyme extract for ten minutes in boiling water or by dialysis, but in the latter case was restored by the addition of the concentrated dialysate.

The transformation of salicylhydroxamic acid to salicylamide may be brought about either by a direct enzymatic reduction of the hydroxylamino group or by an exchange reaction in which the hydroxylamino group is exchanged with ammonia or the amide group of glutamine, leading to the formation of salicylamide and hydroxylamine or glutamohydroxamic acid respectively. Virtanen and Berg[3] have reported the enzymatic formation of benzhydroxamic acid from benzoic acid or benzamide and hydroxylamine, and the role of glutamine in certain exchange reactions of this type has been reviewed by Waelsch[4]. In our experiments, no evidence for the formation of hydroxylamine or glutamohydroxamic acid could be obtained. Furthermore, with salicylamide and hydroxylamine or glutamohydroxamic acid as substrates, no formation of salicylhydroxamic acid was observed. On the other hand, while the intermediate formation of hydroxylamines in the enzymatic reduction of aromatic nitro compounds has been demonstrated previously[5], a similar enzymatic reduction of the hydroxylamino group of hydroxamic acids does not seem to have been reported.

This work is being extended, and a detailed report will be published at a later date.

This investigation was aided by a Public Health Grant secured from the Department of National Health and Welfare, Ottawa, Canada, through the co-operation of the Department of Public Health, Province of Saskatchewan.

Effect of Posterior Pituitary Hormone on the Release of Adrenocorticotrophic Hormone

WE have recently found that the decrease of ascorbic acid concentration of rats' adrenals due to epinephrine is smaller in rats to which pituitrin has been administered and in dehydrated rats than in normal rats[1]. This suggests that the posterior pituitary hormone depresses the adrenal cortical activity. The questions arise, whether the posterior pituitary hormone acts directly on the adrenal or indirectly through the depression of the anterior pituitary secretion, and which fraction of the posterior pituitary hormone, pressor or oxytocic, is responsible for this effect. The present work was undertaken to clarify these points.

Male adult rats were used. Ascorbic acid concentration was determined by the method of Roe and Kuether[2]. Adrenal ascorbic acid concentration of normal rats was 401 ± 16·4 mgm. per cent. When 0·02 mgm. of epinephrine per 100 gm. of body-weight was injected, this concentration decreased to 257 ± 9·8 mgm. per cent; and it remained at a value of 360 ± 22·1 mgm. per cent after injection of the same amount of epinephrine following that of 20 m.u. of pituitrin. When, in place of epinephrine, adrenocorticotrophic hormone (1 u. per 100 gm. body-weight) was administered, the adrenal ascorbic acid concentration was 258 ± 10·9 mgm. per cent, and in this case pituitrin did not alter the value (264 ± 20·1 mgm. per cent). If pituitrin inhibited the adrenocortical secretion directly, it would be expected to suppress the decrease of the ascorbic acid concentration both after epinephrine and after adrenocorticotrophic hormone. As, however, the effect of pituitrin is only seen when epinephrine is used, it may be inferred that the exogenous posterior pituitary hormone inhibits the release of adrenocorticotrophic hormone from the anterior pituitary gland.

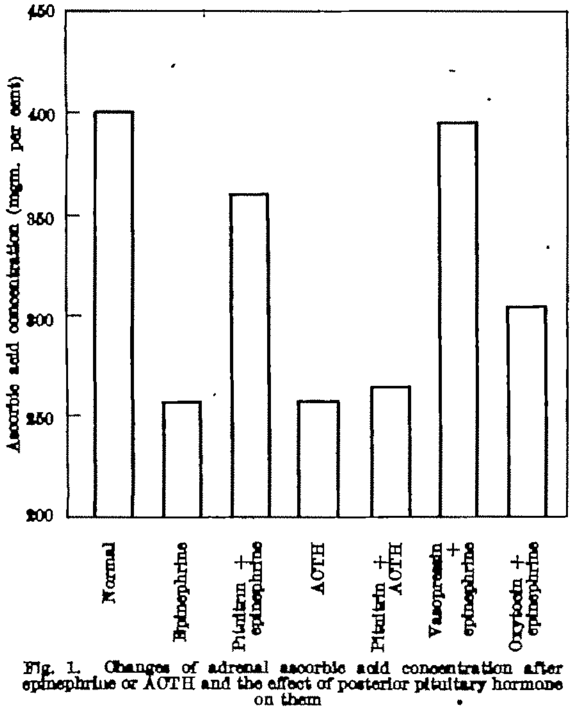

Fig. 1. Changes of adrenal ascorbic acid concentration after epinephrine or ACTH and the effect of posterior pituitary hormone on them

Pressor and oxytocic fractions were separately administered to rats, 20 m.u. per 100 gm. body-weight each, and epinephrine (0·02 mgm. per 100 gm.) was injected, while the adrenal ascorbic acid concentration was determined as in the above experiment. The mean value of ascorbic acid was 395 ± 24·2 mgm. per cent for the pressor fraction and 305 ± 15·8 mgm. per cent for the oxytocic fraction. That is, the former fraction alone shows the above effect.

Details of the experiments will be published in the *Japanese Journal of Physiology*.

Oxidative Dissimilation of Glycerol studied with Variants of *Bacillus subtilis*

COMPARING the quantitative aspect of growths of two parent strains of *B. subtilis*, we concluded[1] that, in one of them (S_1^-), the glycerol is oxidized through the tricarboxylic acid cycle, whereas in the other strain (M_2^-) the glycerol, although actively oxidized, does not reach the tricarboxylic acid cycle.

It has already been shown that, in animal tissues[2] and in bacteria[3], the oxidation of glycerol goes through the two following steps:

$$\text{Glycerol} + \text{ATP} \rightarrow \text{glycerol-phosphate} + \text{ADP}$$

$$\text{Glycerol phosphate} \xrightarrow{-2H} \text{dihydroxyacetone-phosphate or glyceraldehyde-phosphate}$$

This mechanism cannot explain the results we have recently obtained; and we have been able to show the existence of an alternative pathway consisting of the two reactions:

(1) $\text{Glycerol} + \text{DNP}^+ \rightleftharpoons \text{dihydroxyacetone} + \text{DPNH} + \text{H}^+$.

(2) $\text{Dihydroxyacetone} + \text{ATP} \rightarrow \text{dihydroxyacetone-phosphate} + \text{ADP}$.

We have observed activity due to both the enzymes, glyceroldehydrogenase and triokinase, in cell-free

Table 1. Metabolic products of resting cells of the two strains M_2^- and S_1^- tested in Warburg apparatus, each vessel containing in the main cup 2 ml. of bacteria, optical density 3·0 in phosphate buffer pH 6·4, M/20. The first side-arm has or has not glycerol, the second side-arm 0·3 ml. of 5 N sulphuric acid to release carbon dioxide at the end of reaction. All results expressed on the total material by vessel

	Strain M_2^-		Strain S_1^-	
	without glycerol	0·2 ml. M/2 glycerol	without glycerol	0·2 ml. M/2 glycerol
Oxygen absorbed (µl.)	74	226	30	384
Carbon dioxide released (µl.)	75	88	22	227
Respiratory quotient	1·02	0·08*	0·73	0·58*
Dihydroxyacetone (µM)	traces	12·8	0	0·25
Dihydroxyacetone/oxygen (µM)*	0	1·9	0	~ 0

* Corrected for endorespiration.

extracts of *B. subtilis*. Reaction (1) has been reported recently in *Aerobacter aerogenes*[4] and *Escherichia coli*[5]. Although reaction (2) is not known to occur in bacteria, it is present in animal tissues[6].

In *B. subtilis*, these reactions lead to triosephosphate and eventually to pyruvate and the Krebs cycle; or, by condensation, to hexose derivatives. The difference between the two strains of bacteria is the absence of triokinase in strain M_2^-.

These conclusions have been reached by the successive use of cultures, resting cells and cell-free enzymatic extracts.

In aerated cultures[7] in a medium containing mineral salts and glutamate, the glycerol does not affect the growth of M_2^-, but it enhances actively the growth of S_1^-; with both strains, however, it leads to the formation of reducing substances. With strain M_2^-, 90 per cent of these substances is dihydroxyacetone; S_1^- accumulates less reducing substances, which are a mixture of dihydroxyacetone and acetylmethylcarbinol. The latter is known to arise from the condensation of pyruvate. This finding suggests a metabolic block between glycerol and pyruvate in M_2^-.

Resting cells of M_2^- oxidize glycerol quantitatively to dihydroxyacetone (Table 1); the respiratory quotient is almost nil, and two moles are formed for every mole of oxygen consumed. Cells of strain S_1^- oxidize the glycerol further ($R.Q.$ = 0·58) and dihydroxyacetone does not accumulate. Moreover, dihydroxyacetone is oxidized by S_1^- and not by M_2^-; this suggests that it is on the oxidative pathway of glycerol.

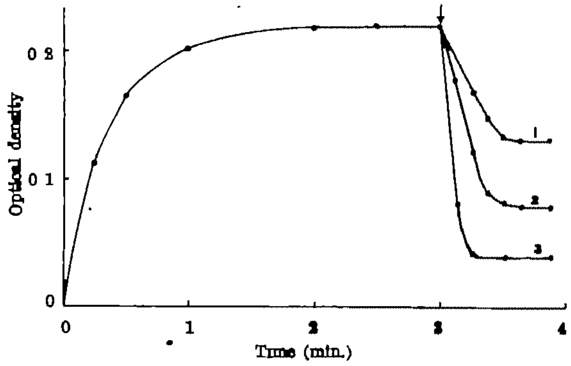

Fig. 1. Glycerol dehydrogenation followed by change in optical density of diphosphopyridine nucleotide at 340 mµ, with a Beckman model *DU* spectrophotometer at room temperature. The reaction mixture at pH 8·7 contained: 0·2 ml. cell-free extract; 0·8 ml. water; 1·5 ml. of M/10 sodium pyrophosphate; 0·2 ml. of 2·5 M glycerol.
At zero time, 0·3 ml. of M/1,000 diphosphopyridine nucleotide was added
At the arrow, dihydroxyacetone added. curve 1, 3 µM. curve 2, 5 µM, curve 3, 10 µM. Points are corrected for dilution due to addition of diphosphopyridine nucleotide

Table 2. Test for kinase activities with extracts of two different strains of *B. subtilis*: µl. carbon dioxide released after 30 min. in bicarbonate buffer pH 7·7, M/30, in Warburg apparatus; gas 5 per cent carbon dioxide in nitrogen. In each vessel, 10 µM adenosine triphosphate, 20 µM dihydroxyacetone, 2 ml. of cell-free extract corresponding to 100 mgm. of lyophilized bacteria, 0·1 ml. of M/5 sodium fluoride, 0·1 ml. of M/5 magnesium chloride

	M_2^-	S_1^-
Adenosine triphosphate	120	65
Dihydroxyacetone	26	18
Adenosine triphosphate + dihydroxyacetone	118	160

Table 3. Same conditions as in Table 2, except 15 µM adenosine triphosphate. Fructose expressed as fructose 6 phosphate (Roe, ref. 9). Total triose (free + phosphorylated) by conversion to methylglyoxal (to be published elsewhere)

Time (min.)	Alkali-labile phosphate (µM)	Total triose (µM)	Fructose (µM)
0	0	37·5	0
5	2·8	36·0	0
10	4·0	36·2	0·52
30	3·6	30·6	1·98
100	2·4	21·6	2·75

Cell-free extracts were prepared from 0·5 gm. lyophilized bacteria treated with 10 mgm. lysozyme in 30 ml. of M/30 bicarbonate buffer, pH 7·7, plus 1 ml. of M/2 citrate. The clear supernatant from the centrifugation at 12,000 r.p.m. is precipitated with ammonium sulphate at saturation. The precipitate is redissolved in 10 ml. bicarbonate buffer. The extracts of both strains contain a glyceroldehydrogenase linked with diphosphopyridine nucleotide (Fig. 1).

The fate of the dihydroxyacetone can be explained by the presence of a triokinase in extracts of S_1^-, which is absent in M_2^-. The kinase activity has been followed by the method of Colowick and Kalckar[8] (Table 2) and by the formation of triosephosphate (alkali-labile phosphate) (Table 3).

It is apparent that the triosephosphate is a transient compound, which disappears partly from the mixture. It is probably condensed to a fructose derivative, which is also further transformed, leading to a net disappearance of the total triose (free and phosphorylated) (Table 3).

Isolation of *n*-Heptadecanoic Acid from Hydrogenated Mutton Fat

In the course of investigations on hydrogenated mutton fat[1], a fraction with saponification equivalent approximating to that of methyl heptadecanoate has been obtained by fractional distillation *in vacuo* in a packed 490 cm. × 3·9 cm. stainless steel column.

Refractionation of an aliquot of this material in a smaller efficient column provided a series of fractions the middle ones of which had saponification equivalents about 284, and these, when converted to acids and submitted to low-temperature crystallization, yielded several grams of a purified acid, of which the saponification equivalent (270·2), melting point (61·2–61·4°) and X-ray analysis (long spacing, 40·8 A.) were all consistent with it being *n*-heptadecanoic acid.

Although other investigators have reported the occurrence of *n*-heptadecanoic acid (margaric acid) in natural fats, Ralston[2] summarizes their work as follows: "All the naturally occurring heptadecanoic acids which have been described and subsequently investigated have been shown to consist of mixtures of palmitic and stearic acids". In the present investigation, however, the characteristics of the fractions preclude the possibility of its being a mixture of palmitic and stearic acids and establish the presence of *n*-heptadecanoic in hydrogenated mutton fat. Further work on the occurrence of *n*-heptadecanoic acid in this and other fats (hydrogenated and unhydrogenated) is in progress and will be published elsewhere.

Short-range Electrical Forces between Charged Colloid Particles

In a previous communication in *Nature*[1], I suggested that the short-range equilibria which have been proved to occur between montmorillonite lamellæ might be ascribed to electrical attractive forces due to a 'crystalline' layer of interlamellar cations, these forces being balanced by repulsive forces due to adsorbed layers of oriented molecules. The phenomenon is unlikely to be confined to montmorillonite. It is therefore of general interest to consider how such an arrangement might pass into the normal diffuse Gouy layer distribution as the separation between the lamellæ increases.

The first modification to be expected in the 'crystalline' layer of ions is that, as more space becomes available, it should separate into two layers, one attached to each of the facing surfaces. We may reasonably suppose that each of the two layers thus formed will arrange itself so as to make the separation between the ions as great as possible, that is, in a hexagonal lattice. The two lattices of ions will adjust their relative position so as to make the mutual potential energy a minimum. This leads to an attractive force between the lamellæ.

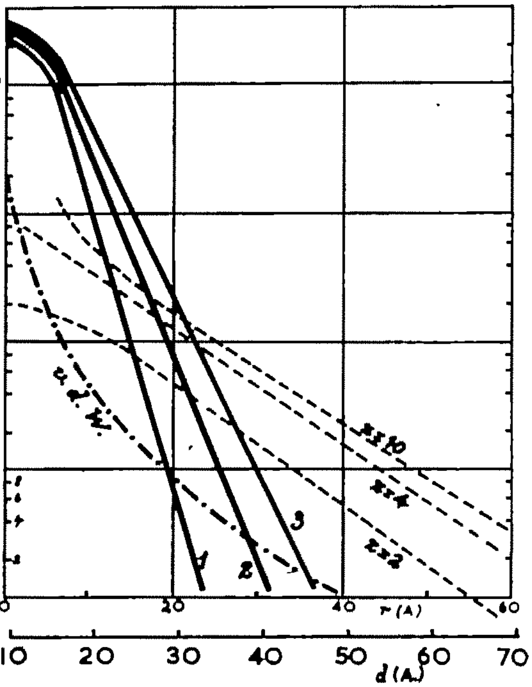

Fig. 1. Potential energy curves for montmorillonite layers. ——, Stern-layer interaction energy (attractive) calculated as described: 1, monovalent cations; 2, divalent; 3, trivalent. — · —, van der Waals energy (attractive) calculated using Verwey and Overbeek's formula (ref. 3), with $A = 5 \times 10^{-12}$. - - -, Gouy-layer interaction energy (repulsive), from Fig. 30 of Verwey and Overbeek's book, with $\kappa = 10^7$. The discontinuous expansion on Norrish's curves (ref. 4) occurs at about 0 27 *N*, corresponding to $\kappa = 10^{7.2}$

For the sake of simplicity of calculation, square lattices rather than hexagonal were postulated. The mutual potential energy of the two lattices of ions may then be evaluated by Madelung's method[2]. The full expression is complicated, involving a double sum of exponential terms, but the following approximate expression will serve as a basis of discussion:

$$V \simeq \frac{2\sqrt{\sigma^3 ev}}{\varepsilon} \exp\left(-2\pi r\sqrt{\frac{\sigma}{ev}}\right)$$

where e is electronic charge, ε is dielectric constant of medium, σ is surface charge density, v is valency of ions, and r is separation between the two layers of ions. The value of σ is given by the known structural charge of the montmorillonite lamellæ, but some assumptions must be made to fix values for ε and r.

For Fig. 1 these assumptions essentially were: (*a*) each ion is surrounded by a hydration shell one molecule thick; (*b*) the dielectric in these shells is saturated ($\varepsilon = 3$); and (*c*) outside the shells the dielectric is normal liquid water ($\varepsilon = 81$). An increase or a decrease in the extent of the saturated dielectric would result, respectively, in a raising or lowering of these curves without change of shape. A shift of the ionic layers towards or away from the lamellæ would result in a bodily shift of the curves to left or right, respectively, again without change of shape.

The same figure shows some of the curves deduced by Verwey and Overbeek[3] for the Gouy-layer repulsive potential, and the van der Waals attractive potential (with $A = 5 \times 10^{-13}$). The following features are noteworthy: (1) Up to about 30 A. interlamellar spacings (d), the electrical attractive potential is everywhere greater than the van der Waals potential. (2) Beyond 30–45 A., the electrical potential rapidly becomes unimportant in comparison with the van der Waals potential. (3) At about 20–25 A. spacing, the Gouy-layer repulsion becomes comparable with the electrical attraction, and rapidly outbalances it as the spacing increases.

Norrish's recent observations on montmorillonite gels[4] have shown that it is just in this region that a discontinuity occurs in the curve of spacing against electrolyte concentration. It may be supposed, therefore, that if the potential minimum described in my previous communication[1] occurs in this region—as it does for the sodium–montmorillonite–water system—lowering of the electrolyte concentration may eliminate it altogether, causing the system to disintegrate. Norrish observed a further series of equilibrium spacings above 35 A., showing a continuous shift with electrolyte concentration; the potential minimum in this region is not explicable on the basis of the electrical forces considered here.

Divalent ions[4] such as calcium apparently do not give spacings greater than 20 A. One factor preventing expansion may be the higher electrostatic interaction potential for such ions (see Fig. 1); but the phenomenon is a complex one, and other possible factors involved are: (*a*) the increased radius of saturation of the dielectric; (*b*) the influence of the ions on the energy of sorption of water; and (*c*) their lower degree of dissociation.

It may appear that there is a contradiction involved in postulating simultaneous action of the electrical forces considered here, and of Gouy-layer repulsion, since a layer of ions cannot be both crystalline and diffused. However, at very small separations most of the ions are forced into the Stern layer, only a few 'floating' freely in the interlamellar space. It is the interaction of the Stern layer ions that gives rise to the attractive potential.

A fuller account of this theory will appear elsewhere. I am indebted to Dr. P. M. Grundy and Mr. G. M. Jolly for advice on the mathematical aspects of this work.

X-Ray and Differential Thermal Studies of some Indian Montmorillonites

IT is well known that members of the montmorillonite group may be classified into a number of subgroups which differ in isomorphous substitution, having varying proportions of different cations[1]. Theoretically, a continuous substitution is possible. But although a wide range of substitution is known in clay minerals, a continuous series has not yet been found.

X-ray and differential thermal studies of some Indian bentonites and soils have yielded interesting results in this connexion. The samples studied are bentonites from (i) Kashmir, (ii) Nimlinadi and (iii) Barme, and black cotton soils from (iv) Satara and (v) Indore.

The X-ray pattern of the clay fraction ($< 2\mu$) of these samples in the glycerol-treated form shows the basal spacing 17·7 A., which agrees with that of standard glycerol-montmorillonite[2]. Only sample (ii) shows, in addition to montmorillonite lines, two others at 7·1 A. and 3·5 A., indicating the presence of kaolinite.

The base exchange capacities of samples (i), (ii) and (iii) are 100, 50 and 90 m.equiv./100 gm. respectively. The lower base exchange capacity of sample (ii) compared to montmorillonite is evidently due to the presence of kaolinite.

The differential thermal curve of sample (i), showing endothermic peaks at 200°, 680° and 880° C., agrees with the standard curve of montmorillonite, except for the exothermic peak at 1,000° C., instead of the usual peak at 950° C. This is possibly due to the high magnesium substitution in the octahedral layer. The chemical analysis is: H_2O, 8·4; SiO_2, 63·18; Al_2O_3, 25·26; Fe_2O_3, trace; MgO, 4·15 per cent.

Differential thermal curves of the other four samples show some deviation from the standard for montmorillonite. The first endothermic peaks, for samples (ii) to (v), occur close to 150° C.; but the second ones corresponding to loss of hydroxyl appear at about 570° C., which is lower by about 100 deg. than that of montmorillonite. The 570° C. peak is close to that of nontronite, which has the same peak near 500° C.[3,4]. The exothermic peak lies between 900° and 950° C., as in montmorillonite; but the endothermic peak corresponding to the final breakdown of the lattice, almost invariably present in montmorillonite, is absent. The differential thermal curve of sample (ii) does not indicate the presence of kaolinite.

All the samples reported on here thus belong to the montmorillonite group on the basis of X-ray data; but differential thermal analysis reveals significant deviations, and indicates that the samples (ii), (iii), (iv) and (v) constitute a subgroup intermediate between montmorillonite and nontronite. This probably means a proportionately smaller amount of iron in the lattice than in nontronite. Complete chemical analysis of the samples after removal of free iron oxide is being carried out in order to verify the above assumption.

Two nontronite samples from (vi) Garfield, Washington, and (vii) Sandy Ridge, North Carolina, have also been analysed to study the features distinguishing the present subgroup from nontronite. They show the same basal spacing, namely, 17·7 A. The exothermic peak in both appears at 850° C., which is characteristic of nontronite. The characteristic endothermic peak was found to be at 500° C. in (vi) and 570° C. in (vii). The curve obtained with (vi) agrees with that of standard nontronite. The OH-binding energy in sample (vii) appears to be definitely greater than in standard nontronite, and corresponds to that of the subgroup formed by samples (ii), (iii), (iv) and (v); but its exothermic peak retains the characteristics of the typical nontronite.

The above information, therefore, suggests that samples (ii), (iii), (iv), (v) and (vi) form a more or less continuous link in the montmorillonite – nontronite series.

Heat Transfer in Pulsating Flow

When pulsations are imposed on a flowing fluid, it may normally be expected that heat transfer to or from it would be changed because the pulsations would alter the thickness of the boundary layer and hence the thermal resistance. In the laminar region, this view is also supported by the fact shown by Richardson[1] that the velocity profile for pulsating flow is steeper near the wall than for smooth flow. It follows from a consideration of the Reynolds analogy that the heat transfer should increase under such conditions. A similar process might occur for turbulent flow also, but the equations are too cumbersome for analytical solution.

Experimental information about the process, however, is meagre and sometimes conflicting. In the turbulent region, Martinelli *et al.*[2,3] and Marchant[4] found no difference in heat transfer between steady unidirectional flow and pulsating flow, but West and Taylor[5] reported an increase of 60–70 per cent. In the laminar region, Marchant[4] noted a slight increase, whereas Morris[6] and Webb[7] found no change. All these investigations were carried out at low pulsation frequencies by heating flowing water. Working with oil, Linke[8] found an increase in heat transfer of up to 4 times in the laminar region and up to 1·35 times in the turbulent region. In air, Stanton *et al.*[9] found no difference between a static and a vibrating finned engine-cylinder, whereas Kubanskii[10] obtained an increase of 50 per cent at acoustic frequencies. Andreas[11] advocated the mechanical vibration of the entire heat exchanger to improve heat transfer.

We have carried out investigations under the auspices of the Council for Scientific and Industrial Research, New Delhi, on the heat transfer to pulsating air. These investigations have been carried out by the external heating, by steam, of air at or near atmospheric pressure, flowing in a horizontal pipe of 1 in. inside diameter and 6 ft. 10 in. effective heating length. The heat transfer coefficients were measured first with steady unidirectional flow and then with pulsations imposed on the flow by means of a poppet valve operating in the path of the air. The wave-form and amplitude were measured by an instrument based on an idea of Schweitzer[12]. Reynolds number was varied from 5,000 to 35,000 and frequency of pressure pulsations from 5 to 33 c./s. The experiments were repeated with different wave-forms and amplitudes.

The Reynolds and Nusselt numbers were calculated at the mean temperature of the air, and the velocity used was that obtained by dividing the total volume flow by the cross-sectional area of the pipe. It was found that the Nusselt number changed up to about 30 per cent in a rather uneven but defined manner under different conditions of frequency, amplitude, wave-form and Reynolds number. In general, the change was negative below a certain frequency and positive above it, in the range of frequencies investigated. This critical frequency was a function of the wave-form and to a lesser extent of the Reynolds number. The magnitude of the change increased slightly with Reynolds number, the negative part of the curve increasing at lower Reynolds numbers and the positive part at higher Reynolds numbers. Only a negligible change could be detected when the amplitude of the pulsation was very low, thus corroborating the negative results of Stanton[9]. With higher amplitudes, the change was not directly proportional to the amplitude but depended on a function which combined the frequency, amplitude and Reynolds number. The exact nature of this function is now being investigated. It seems likely that not only the total magnitude of the pressure amplitude but also the steepness of the wave (or the rate of change of pressure in the wave) plays an important part in the mechanism of forced convective heat transfer under pulsating flow conditions.

Ageing of Quartz Crystal Vibrators

It is probable that in the field of use of quartz crystal vibrators there are no requirements more exacting than those imposed on the quartz vibrator which is used to control the time-keeping of a quartz clock. The British Post Office has had considerable experience in fabricating 100 kc./s. quartz vibrators and incorporating them in suitable oscillator circuits to maintain clocks or frequency standards. It is the general experience that these oscillators have a slow frequency change even after several months of uninterrupted operation. This change is extremely small, being of the order of one part in 10^9 a day for a good clock to one part in 10^{11} for the best clock. Recent tests have shown that the frequency-change or 'ageing' can be reduced by using the crystal vibrator at a temperature which is lower than the normal 50° C.

Fig. 1 shows the results of some tests on a 100 kc./s. *GT*-cut quartz crystal operating at two different temperatures, one within a few millidegrees of a nominal 50° C. and the other of a nominal − 10° C.

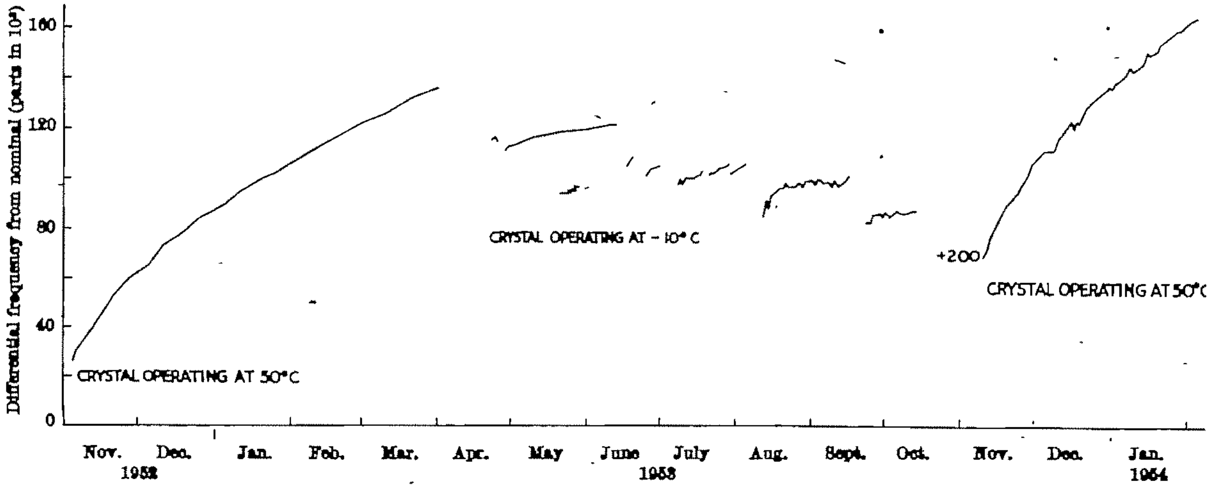

Fig. 1. *GT*-cut quartz resonators. Performance curves for crystal No. 5423

It will be seen that the ageing rates were of the order of:

50 parts in 10^{10} a day at 50° C.
10 parts in 10^{10} a day at – 10° C., and
80 parts in 10^{10} a day when operated again at 50° C.

The crystal used in these tests was gold-plated and was mounted in a clamp in an evacuated copper container. No satisfactory explanation of its ageing or of the reduction of ageing at the lower temperature is known.

A somewhat novel method was used for obtaining the stable – 10° C. condition. The crystal is normally housed in an oven maintained at 50° C. by a bridge-controlled unit. The temperature at which such an arrangement controls depends upon making the bridge balance at the desired temperature and ensuring that the ambient temperature does not approach too closely the desired operating temperature. For the cold tests, the control bridge was made to balance at – 10° C. and the ambient was reduced to – 20° C. by putting the oven in a domestic refrigerator of the deep-freeze type. Some slight difficulties were experienced when the leads from the oscillator to the crystal iced up, and though these were fairly readily cleared, they account for the intermittent nature of the – 10° C. curve.

This communication is published by permission of the Engineer-in-Chief of the British Post Office.

Cadmium in Sea-water

ALTHOUGH cadmium has been detected in a number of marine animals in amounts ranging from 0·03 to 11 mgm. per kgm. of the dried organism[1,2], its presence in the sea has not so far been established except by inference[3]. Thus Baidet *et al.*[4], who were able to identify spectrographically fourteen trace metals in a concentrate from 60 l. of sea-water from Roscoff (Brittany), were not able to detect cadmium. Noddack and Noddack[2] consider that the concentration of cadmium in the sea is less than 0·5 µgm./l.

In the present investigation, cadmium was extracted from 1-litre samples of sea-water from the Irish Sea by means of a chloroform solution of dithizone in the presence of cyanide at *p*H 8·8. The cadmium in the extracts was determined spectrophotometrically by a modification of Saltzman's[5] dithizone method (detection limit 0·006 µgm. cadmium).

The unequivocal detection of cadmium was carried out by evaporation of the dithizone extracts on spectrographically pure calcium carbonate (cf. Wark[6]). The products were examined spectrographically by means of a d.c. arc taking 5·5 amp., between pure graphite electrodes. Blank determinations revealed the absence of cadmium in the reagents. In all the spectrograms of sea-water samples the *raies ultimes* of cadmium at 2288·018 A. and 2265·017 A. were strong, and in some a further line at 3261·057 A. was visible. No other elements could be detected in the dithizone extracts. Tests on known amounts of cadmium showed that the 2288·018 A. line was just visible when 5 mµgm. of cadmium was present. This is a considerably greater sensitivity than can be attained by means of the copper spark method[7], or using sodium fluoride as a carrier[8]. Five samples of surface water from the Irish Sea contained amounts of cadmium ranging from 0·032 to 0·075 µgm./kgm. (mean 0·055 ± 0·012 µgm./kgm. or 0·49 µgm.-atoms/ton). This is lower than the concentrations of either zinc or mercury in the sea (*c.* 80[9] and 1·5[10] µgm.-atoms/ton respectively) and is somewhat less than was predicted by Buljan[11].

Further work is proceeding on the seasonal variation of cadmium in the sea and on its concentration by marine algae.

Succinoxidase Activity of the Flight Muscles of the Wasp, *Sceliphron cementarium*

In insects, succinoxidase activity has been studied in the milkweed bug[1], in the embryonic cells of the grasshopper *Melanoplus differentialis*[2], in the thoracic muscles of the American cockroach *Periplaneta americana*[3], and in the thoracic muscles of the woodroach *Leucophaea maderae*[4]. Harvey and Beck[3] reported a sex difference in the thoracic muscles of the American cockroach, the males showing three times as much activity as the females. This difference was confirmed by McShan *et al.*[4], who also showed that in the woodroach the male and female thoracic muscles have approximately equivalent succinoxidase activity (see Table 1).

Table 1. SUCCINOXIDASE ACTIVITY IN INSECT THORACIC MUSCLES, AFTER VARIOUS AUTHORS

Insect		Average Q_{O_2} values	Author
Periplaneta americana	♂	275	Harvey and Beck, 1953
" "	♂	167	Kramer and McShan (unpublished MS.)
" "	♀	38·1	
Leucophaea maderae	♂	156	McShan *et al.*, 1954
" "	♀	153	
Sceliphron cementarium	♀	128	Present paper

In the latter paper it was pointed out that a much higher concentration of succinate (0·20 *M*) is required for optimum activity of the succinoxidase system of woodroach muscle than for this system in mammalian tissues such as rat liver, which requires only 0·05 *M* succinate[5]. Harvey and Beck[3] found 0·11 *M* succinate optimum for American cockroach muscle. These results suggest that tissues such as roach muscle, which are high in succinoxidase activity, require higher concentrations of succinate for maximum activity than do tissues comparatively low in succinoxidase activity.

With this in mind a study of succinoxidase in the indirect flight muscles of the wasp, *Sceliphron cementarium*, was undertaken, using identical concentrations of reagents and co-factors worked out by McShan *et al.* for the woodroach. Individual wasps (these were all females collecting mud from the margin of an excavation pool) were brought in from the field during late June, dissected, remnants of the gut and tracheal tubes were cleaned away and the large indirect flight muscles were removed. The tissue was weighed, placed in ground-glass homogenizing tubes contained in an ice bath and homogenized within 8–10 minutes after the wasps were killed. Sufficient water was added to give a 2·5 per cent homogenate.

The enzyme determinations were made by use of the conventional Warburg apparatus. Runs were made using 0·05 ml., 0·1 ml. and 0·15 ml. of homogenate together with the required co-factors and reagents as worked out for woodroach muscle. The final concentrations of co-factors and reagents used n the flasks were 0·2 *M* succinate; 0·05 *M* phosphate buffer *p*H 7·3; 1·6 × 10^{-3} *M* each of calcium and aluminium chlorides; and 2 × 10^{-5} *M* cytochrome c. Sufficient water was added to each flask o give a total volume of 3·0 ml. Flasks were placed n the bath at 38° C., ten minutes were allowed for equilibration, and readings of oxygen consumption were taken at ten-minute intervals for forty minutes. The average value for the number of ten-minute periods, during which oxygen consumption was constant, was used as a basis for calculating the Q_{O_2} values.

Table 2. OXYGEN UPTAKE IN CU.MM. FOR 0·05, 0·1 AND 0·15 ML. OF WASP MUSCLE HOMOGENATE

Run	Amount of tissue homogenate in ml.			
	0·05	0·1	0·15	Q_{O_2}
1	6·5	14·15	20·3	106
2	7·9	17·9	24·8	130
3	9·8	18·9	26·8	147
Average	8·1	17·0	24·0	128

The results of these runs are shown in Table 2. As indicated in Fig. 1, the average oxygen consumption for three wasps, each taken from the field and run on three successive days, gave almost perfect linearity from 0·05 ml., 0·1 ml. and 0·15 ml. of tissue homogenate. The average dry weight of this muscle on the basis of three wasps was 30·6 per cent, and using this dry weight for all calculations, the average Q_{O_2} for the three runs was 128.

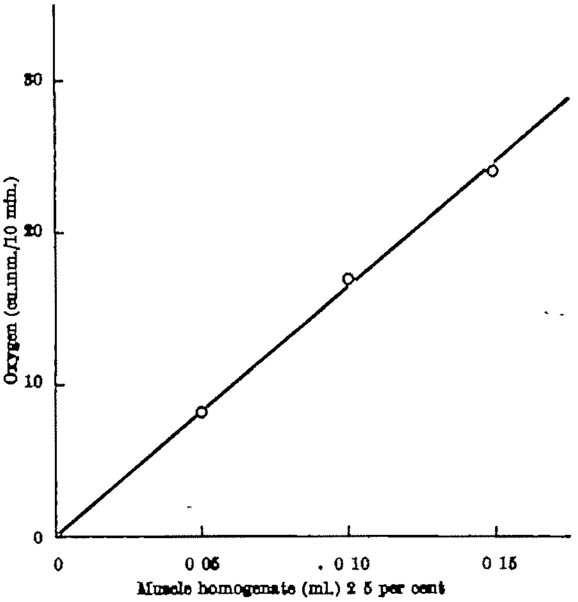

Fig. 1. Relationship between amount of wasp muscle reacting and average amount of oxygen consumed per 10 min.

It is apparent that optimum conditions for the determination of succinoxidase activity of the indirect flight muscles of the wasp *Sceliphron cementarium* are the same as those reported previously for woodroach thoracic muscle.

I am indebted to Prof. W. H. McShan for assistance with this study.

Thermal Reactions of Kenya Cattle vaccinated with Lapinized Rinderpest Virus

Many workers[1] have recorded thermal reactions in cattle following vaccination with lapinized rinderpest virus. In Kenya, thermal reactions are notable by their absence in vaccinated zebu, high- and low-grade European-zebu crosses and pure-bred European cattle[2]. In an attempt to clarify the position, an analysis of 5,295 morning temperatures from 444 cattle, including 113 uninoculated controls, was made. The cattle had been used for the testing of batches of lapinized rinderpest virus vaccine between August 30, 1950, and March 10, 1952. All the vaccinated cattle were found to be immune on challenge with virulent virus and all the control cattle proved to be susceptible.

Pertinent data are recorded in Tables 1, 2 and 3. The normal morning bovine rectal temperature at the Rinderpest Isolation Laboratory, Kabete, altitude 6,000 ft., and situated between the 65° F. and 70° F. isotherms, was 100·63° F. (± 0·02° F.) with a coefficient of variation of 1 per cent. The temperature curves of the uninoculated and the vaccinated cattle were identical except on the fifth, sixth and seventh days after inoculation. Over this period the temperatures of the vaccinated animals were significantly higher and, as might be expected, the rise began earlier in the cattle which had received the higher concentration of the virus.

The thermal reaction in cattle, after inoculation with caprinized rinderpest virus, occurs on the fifth–seventh days, and it is suggested that a similar syndrome is associated with the administration of lapinized rinderpest virus, except that the reaction cannot be detected by an examination of a few animals. Thus the dictum 'no reaction no immunity' might be held to be fulfilled with this, as with other types of live rinderpest virus vaccination.

It is noteworthy that the mean rectal temperature of grade steers was 100·63° F. (± 0·02° F.). This figure is lower than that reported from Europe[3] and India[4].

I am indebted to the Director of Veterinary Services, Kenya, for permission to publish these findings.

G. R. Scott

Veterinary Research Laboratory,
Kabete, Kenya.

A Polarographic Method for the determination of the Gamma Isomer of Benzene Hexachloride in Cattle Dips

One serious practical difficulty in the use of benzene hexachloride in cattle dips is that of loss of biological efficiency.

The accurate biological testing of dip-washes is a difficult and lengthy process; but recently Downing *et al.*[1] have shown that loss of biological efficiency is accompanied by a corresponding diminution in the ratio gamma isomer/total benzene hexachloride. These workers used partition chromatography of the extracted benzene hexachloride for the determination of the gamma isomer; but because this method is not well adapted to routine examination of large numbers of samples, a polarographic approach was attempted.

Under the conditions of high altitude and ambient temperature prevailing at these laboratories, Dragt's[2] method is inconvenient due to the use of acetone as a solvent, and the method of Ingam and Southern[3] gave unsatisfactory results in our hands when applied to the analysis of gamma concentrates containing relatively high concentrations of the interfering[4] heptachlorocyclohexane.

The following method was found satisfactory. A Cambridge voltamoscope was used at sensitivity 1/20 and moderate damping, the midpoint of the galvo oscillations being measured.

The following reagents were used: concentrated hydrochloric acid; 95 per cent ethyl alcohol, redistilled from silver nitrate to remove reducible impurities; 0·5 per cent gelatin solution, prepared daily; 0·2 *M* potassium chloride.

To a volume of the well-mixed sample, containing about 40 mgm. gamma isomer, add one-quarter its volume concentrated hydrochloric acid. Filter, and wash the solids with cold distilled water until free from acid. Dry in a desiccator over solid sodium hydroxide, and when dry, extract the solids with purified alcohol in a Soxhlet. Dilute the extract to 100 ml. with alcohol. Pipette a 25-ml. aliquot into a 50-ml. volumetric flask, add 0·5 ml. 0·5 per cent gelatin and dilute to volume with 0·2 *M* potassium chloride. Filter a portion into a polarographic cell, de-gas with hydrogen or nitrogen, and record the wave between − 0·5 V. and − 1·8 V. versus saturated calomel electrode at 30° C. (This temperature was used because of the high ambient temperature.) To measure the wave-height draw a straight line through the curve at $-0\cdot6$ V. and $-1\cdot0$ V. and extend to meet the $-1\cdot3$ V. perpendicular. The vertical distance between this intersection and the wave at $-1\cdot7$ V. gives the wave-height.

The gamma isomer concentration is read from a standard curve prepared using pure gamma isomer. A convenient range for this curve is 3–15 mgm. gamma isomer, this yielding a straight line, not passing through the origin.

Further aliquots of the alcohol extract are analysed for total benzene hexachloride by normal dehydrohalogenation methods, and the ratio gamma isomer/total benzene hexachloride calculated.

The method of extracting the benzene hexachloride is essentially that of Hitchcock *et al.*, as briefly described by Mackerras[4], while the empirical method of wave measurement is similar to that of Dragt[2].

I wish to thank the Chief Veterinary Research Officer, Tanganyika, for the constant interest he has shown during the development of this method, and the Director of Veterinary Services, Tanganyika, for permission to publish this account.

Isolation from the Lower Respiratory Tract of Chickens of Bacteria administered by Mouth

It is generally assumed that bacteria ingested in food or water do not enter the trachea but that all of them pass down the œsophagus. One interesting observation in this respect was made by White and Minett[1], who noted that when calves were fed milk containing *Mycobacterium tuberculosis* primary lesions of tuberculosis were sometimes found in the lungs, indicating that some of the bacteria administered may have been aspirated into the lungs. More direct evidence that this may occur was obtained as a result of some experiments that were designed to trace the route by which *Salmonella gallinarum* enters the body following its administration to chickens by mouth.

In the initial studies large numbers of *Salm. gallinarum* bacteria were mixed in a commercial mash and fed to chickens which were then killed at different times and selected organs cultured. *Salm. gallinarum* was isolated from the lungs of an unexpectedly high proportion of chickens, in some after an interval of time so short as to preclude them having reached this organ via the intestine.

In view of this, four groups each consisting of fifteen nine-week-old chickens were taken. The first group was fasted for 12 hr. and then fed on a commercial mash into which had been mixed an 18-hr. broth culture of *Salm. gallinarum*, 1 ml. per 10 gm. of mash. The culture contained approximately 50×10^7 bacteria per ml. Water was withheld from the second group for 12 hr. This group was then provided with drinking water, every 10 ml. of which contained 1 ml. of the broth culture. 1 ml. of the culture was placed carefully into the mouth of the chickens in the third group by means of a pipette. A similar amount of culture was given to the fourth group by means of a pipette introduced via the mouth into the œsophagus, care being taken to avoid touching the epiglottis.

The chickens were killed ½ hr. later by dislocation of the neck, and, at the same time, a pair of strong artery forceps was fixed, through the skin, around the upper portion of the trachea so as to occlude its orifice. A post-mortem examination was then carried out using aseptic precautions. Cultures were made from the mucous membrane of the lower end of the trachea on to deoxycholate–citrate agar[2] and a portion about 1 in. long of this part of the trachea placed in a tube of selenite-F medium[3]. Most of the left lung was removed, ground in sterile sand and one loopful of this streaked on to a plate of deoxycholate–citrate agar; the remainder was placed in a tube of selenite-F medium. The selenite-F cultures were incubated at 37° C. for 24 hr. and plated on to deoxycholate–citrate agar. All plates of the latter medium were incubated at 37° C. for 24 hr. and then examined for the presence of *Salm. gallinarum*. The results are shown in Table 1.

Table 1

Method of administering *Salm. gallinarum*	No. of 15 chickens in which *Salm. gallinarum* was isolated from: Trachea	Lung	Trachea and/or lung
In food	4	10	12
In drinking water	4	5	7
Into mouth by pipette	9	3	10
Into œsophagus by pipette	0	0	0

Salm. gallinarum was not isolated from the lower respiratory tract of any of the fifteen chickens to which it was given by means of a pipette into the œsophagus. Quite different results were obtained when it was administered by the other three methods, *Salm. gallinarum* being recovered from the trachea or lungs of a considerable proportion of these chickens. It is noteworthy that *Salm. gallinarum* was isolated more frequently from the trachea than from the lungs of the chickens to which it was given by pipette into the mouth (9–3); the reverse was true in the case of the chickens fed infected food (4–10).

Salm. gallinarum was only isolated by direct culture in one case, from the trachea of a chicken given this organism by pipette into the mouth. The other isolations were made through selenite-F medium. It is therefore probable that infection via the lower respiratory tract would be of little significance under natural conditions since chickens would not be exposed to such large numbers of bacteria. However, it is a point to be borne in mind when the production of experimental infections is under consideration.

Tape for Microsectioning of Very Large, Hard or Brittle Specimens

DURING the last decades of the nineteenth century several methods were introduced to make sectioning possible of such hard or brittle specimens as eggs, containing large amounts of yolk granules, and arthropods with a skeleton of chitin, where the usual paraffin technique failed.

The section-surface of the paraffin block was coated with a thin film of collodion, paraffin, shellac or mastic, and this procedure was repeated after each section made.

Sometimes such methods are still used, in case of emergency; but they are rather difficult to handle and very often quite unsatisfactory.

Against these methods a ribbon of cellulose tape applied over and firmly pressed to the section surface of a paraffin block or of a specimen in the freezing microtome serves admirably for the purpose.

The section is very firmly attached to the sticky substance of the tape, and hence it cannot be wrinkled or shattered by the sectioning. Sections ranging from one micron or less in thickness to several hundred microns are always quite even. In fact, there is no trouble at all in sectioning specimens from which it would seem to be impossible to get useful sections with any other method. (For example, with the tape method whole adult mice have been sectioned (for autoradiograms) in a freezing microtome without fixation or decalcification.)

The sticky substance on the tape is soluble in benzene, toluene and xylene. Hence, the paraffin (of paraffin sections attached to tape) cannot be dissolved in the usual manner in benzene. However, the paraffin can be slowly removed in warm amyl alcohol, the sticky substance being insoluble in alcohols.

The cellulose tape is stainable, therefore drops of stain solutions should be applied to the section only. Glycerol can be used as mounting medium.

However, from a histological point of view it is preferable to transfer the section to a glass slide by the following technique.

(1) Mount the section on the tape, with the section turned upwards, on a glass slide with small strips of tape (applied so that they do not cover any part of the section itself). This is in order to get the section on a horizontal level.

(2) Spread out, using a glass rod, ½ per cent solution of celloidin in absolute alcohol and ether, equal parts, to a thin layer all over the section (but not all over the tape). Let the celloidin film perfectly dry in the air.

(3) Transfer the preparation to benzene (or toluene or xylene) in a shallow wide glass dish (for example, a Petri dish) and leave it until (within a few minutes) the collodion film, including the section, can easily be loosened from the tape. Leave the section for a while in benzene, so that all the remaining sticky substance is dissolved.

(4) Smear a cleaned slide rather liberally with egg albumen all over, dip the slide, with the smeared surface upwards, in the benzene and float the section, the previous 'tape-side' down, to the slide. Mount the section on the slide and press and blot it dry with a piece of filter paper.

(5) Transfer, at once, the slide to absolute alcohol and ether in equal parts, and leave it until the collodion is dissolved. In my experience the section is now firmly cemented to the slide.

(6) Transfer the slide to 95 per cent alcohol. Now the section can be treated as an ordinary deparaffinized section fixed on a glass slide, thus suitably stained and finally mounted in the usual manner.

Frozen sections fixed on tape must either be dried (for example, for autoradiograms of water-soluble radioactive substances) or, from a histological point of view, better, of course, be transferred from water to alcohol and to absolute alcohol before the collodion film is applied as described above.

The section can (for photographic registration of radioactivity) be attached directly to the photographic film without egg albumen, but preferably after moistening the film.

The tape method may be useful whenever the ordinary micro-sectioning technique fails and also for cutting very thin sections and for reconstructions. Sections made with the tape technique are even and are uniform from the beginning and never require any deforming treatment.

Series of sections can be made by cutting sections, border to border, on one and the same ribbon of tape, which is held rolled up on each side of the paraffin block above the level of the microtome knife during the sectioning, so that the knife does not cut the tape itself.

Zoological Nomenclature

NOTICE is hereby given that, as from November 11, 1954, the International Commission on Zoological Nomenclature will start to vote on the following cases involving the possible use of its plenary powers for the purposes specified against each entry. Full particulars of these cases were published on May 11, 1954, in the *Bulletin of Zoological Nomenclature* in Parts 6, 7 and 8 of Volume 9. (1) *immigrans* Sturtevant, 1921 (*Drosophila*) (Cl. Insecta, Order Diptera), validation of; (2) *pruni* Geoffroy, 1762 (*Aphis*) (Cl. Insecta, Order Hemiptera), validation of; (3) *Lachnus* Burmeister, 1835, and *Cinara* Westwood, 1835 (Cl. Insecta, Order Hemiptera), designation of type species for; (4) *Stentor* Oken, 1815 (Cl. Ciliophera), validation of, and designation of type species for; (5) *Melanargia* Meigen, 1828 (Cl. Insecta, Order Lepidoptera), validation of; (6) Geoffroy, 1762, *Hist. abrégé*; validation of six generic names (*Stratiomys*, *Stomoxys*, *Volucella*, *Nemotelus*, *Scatopse*, *Bibio*) in the Order Diptera, published in; (7) *Palmatotriton* Smith, 1945 (Cl. Amphibia), suppression of; (8) *Ammonites mammillatus* Schlotheim, 1813, designation of neotype for, and *Douvilleiceras* de Grossouvre, 1893, designation of type species for (Cl. Cephalopoda, Order Ammonoidea).

Comments on the above cases should be sent to me as soon as possible.

FRANCIS HEMMING
(Secretary to the International
Commission on Zoological Nomenclature)

28 Park Village East,
Regent's Park,
London, N.W.1.

FORTHCOMING EVENTS

(*Meetings marked with an asterisk * are open to the public*)

Monday, July 5—Saturday, July 10

Society for Applied Bacteriology (in the Agriculture Lecture Room, The University Department of Agriculture, 10 George Square, Edinburgh)—Annual Meeting and Summer Conference.

Tuesday, July 6

Association for the Study of Animal Behaviour (in the Psychology Department, Birkbeck College, Malet Street, London, W.C.1), at 10.30 a.m.—Scientific Papers on "Some Aspects of Social Behaviour".

Wednesday, July 7

Physical Society (at the Royal Institution, 21 Albemarle Street, London, W.1), at 4.30 p.m.—Prof. J. A. Wheeler (Princeton University): "Fields and Particles"*.

Royal Meteorological Society (at the National Institute of Oceanography, Wormley, near Godalming, Surrey)—Summer Meeting*.

Wednesday, July 7—Saturday, July 10

Institute of Physics, Non-Destructive Testing Group (at Chancellor's Hall, The University, Birmingham)—Summer Meeting.

Thursday, July 8

At 9.15 a.m.—Annual General Meeting.

Wednesday, July 7—Wednesday, July 14

Institution of Production Engineers (in the National Hall, Olympia, London, W.14)—Production Exhibition and Conference.

Wednesday, July 7—Friday, July 16

Commonwealth Institute of Entomology (in the Large Chemistry Lecture Theatre, Chemistry Department, Royal College of Science, Imperial Institute Road, London, S.W.7)—Sixth Commonwealth Entomological Conference*.

Thursday, July 8—Monday, July 12

British Institution of Radio Engineers (at the University of Oxford)—Convention on "Industrial Electronics".

Friday, July 9

Physical Society (at the Royal Institution, 21 Albemarle Street, London, W.1), at 4.30 p.m.—Prof. E. Amaldi (Rome): "The European Organization for Nuclear Research"*.

Friday, July 9—Saturday, July 10

Physical Society, Optical Group (at the University, Reading)—Summer Meeting.

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned:

Assistant, Grade B (with a good degree and able to teach inorganic and physical chemistry to degree standard) in Chemistry—The Secretary, Norwood Technical College, Knights Hill, London, S.E.27 (July 8).

Agricultural Economist and an Assistant Agricultural Economist (with a degree in economics, agricultural economics or agriculture); and a Lecturer or Assistant Lecturer in Agricultural Economics—The Registrar, University College of Wales, Aberystwyth (July 9).

Assistant Lecturer in Physics—The Registrar, University College of North Staffordshire (July 10).

Lecturer in Physiology—The Registrar, King's College (University of London), Strand, London, W.C.2 (July 10).

Lecturer (with a good honours degree in mathematics and sound teaching experience) in the Mathematics Department—The Registrar, Technical College, Sunderland (July 10).

Physical Chemist (preferably with experience in ultra-violet absorption spectroscopy), to apply spectroscopic techniques to problems of organic chemistry and biology—The Secretary, Chester Beatty Research Institute, Institute of Cancer Research, Royal Cancer Hospital, Fulham Road, London, S.W.3 (July 10).

Physicists and Engineers (Scientific Officer and Experimental Officer grade) at the Ministry of Supply Radar Research Establishment, Malvern, Worcs, for the design and testing of high temperature electronic components for use under severe vibration and climatic conditions—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S.W.1, quoting A.161/54A (July 10).

Scientific Officer (with first- or second-class honours degree in chemistry or equivalent, with special emphasis on inorganic chemistry, and an interest in, and a sound knowledge of, mineral analysis), in the Mineral Resources Division, Colonial Geological Surveys, for work in laboratories at Imperial Institute Building, London, S.W.7, on the analysis and examination of minerals and their products, rocks, soils, etc., and the development of methods of analysis—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S.W.1, quoting F.382/54A (July 10).

Scientific Officer (with first- or second-class honours degree or equivalent in physics, electrical engineering or mathematics, and preferably with research experience in electronics or aerodynamics, or flying experience with the R.A.F.), at the Royal Aircraft Establishment Experimental Unit, Martlesham Heath, for work on all weather and rapid landing problems of civil and military aircraft, involving co-operation in design and assessment of full scale flight experiments in marshalling, blind approach and landing, and liaison with civil and military aviation authorities—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S.W.1, quoting A.160/54A (July 10).

Senior Lecturer (preferably with an interest in the physics of the ionosphere) in Physics, at University College, Ibadan, Nigeria—The Secretary, Inter-University Council for Higher Education in the Colonies, 1 Gordon Square, London, W.C.1 (July 10).

Assistant Analyst (with either a university degree or A.R.I.C., and preferably with experience in the analysis of food and drugs)—The County Medical Officer of Health, East Cliff County Offices, Preston, quoting "Assistant Analyst" (July 12).

Scientific Officer (with an honours degree in plant physiology) in the Irrigation Section—The Secretary, National Vegetable Research Station, Wellesbourne, Warwick (July 12).

Lecturer in Moral Philosophy—The Secretary, The University, Aberdeen (July 13).

Assistant Lecturer and Demonstrator (graduate in science or technology, with subsidiary qualifications in biochemistry or physics) to lecture on the pure sciences on which leather technology is based, and to supervise laboratory work—The Registrar, National Leathersellers College, 176 Tower Bridge Road, London, S.E.1 (July 16).

Research Demonstrator in Physics—The Registrar, University College, Leicester (July 16).

Research Officer (with a university honours degree in science with mathematics as major subject, preferably with physics also to a high standard or equivalent qualifications) in the Division of Radiophysics, Commonwealth Scientific and Industrial Research Organization, Sydney, N.S.W., Australia, to organize and take charge of a group which will be responsible for the analysis of the results of cloud seeding experiments, of rainfall and other singularities, and the possible effects of meteoritic dust, and allied problems—The Chief Scientific Liaison Officer, Africa House, Kingsway, London, W.C.2, quoting 780/123 (July 16).

Research Scholar (graduate in science or technology, or other suitable qualification), to carry out research on some problems of interest to the leather industry, and to take part in teaching—The Registrar, National Leathersellers College, 176 Tower Bridge Road, London, S.E.1 (July 16).

Applied Geneticist (Scientific, Senior Scientific or Principal Scientific Officer grade) to work on the problems of fruit and vegetable breeding in Scotland, and a Crop Physiologist (Scientific, Senior Scientific or Principal Scientific Officer grade), to study effect of environment and climatic complex on horticultural crops in Scotland—The Secretary, Scottish Horticultural Research Institute, Mylnefield, Invergowrie, by Dundee (July 20).

Research Scholar (with a good honours degree in chemistry)—The Registrar, The University, Reading (July 24).

Assistant Lecturer (with an honours degree in agricultural chemistry or chemistry) in Agricultural Chemistry—The Registrar, The University, Reading (July 31).

Lecturer in the Department of Botany of the University of Pietermaritzburg—The Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1 (July 31).

Senior Lecturer in Applied Mathematics at the University of Natal, Durban, a Senior Lecturer in Applied Mathematics and a Lecturer in Mathematics, at the University of Natal, Pietermaritzburg—The Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1 (July 31).

Senior Research Fellow (with research experience in virology) in the Department of Micro-Biology, John Curtin School of Medical Research—The Registrar, Australian National University, Box 4, G.P.O., Canberra, A.C.T., Australia (July 31).

Administrative Officer (preferably with technical experience appropriate to an organic chemical laboratory), for duties which will include buying, accounting and laboratory management under the Head of the Department—The Secretary, Dyson Perrins Laboratory (Oxford University), South Parks Road, Oxford.

Allen and Hanburys Research Fellowship tenable in the Department of Pharmacology—The Clerk to the Council, School of Pharmacy, University of London, 17 Bloomsbury Square, London, W.C.1.

Assistant (medically qualified, and preferably with experience in bacteriology) for teaching and research—The Secretary, University College Hospital Medical School, University Street, London, W.C.1.

Biochemist (preferably with experience in hospital biochemistry)—The Secretary, Stepney Group Hospital Management Committee, Raine Street, Wapping, London, E.1.

Crop Ecologist (with either a good honours degree in botany with postgraduate training in agriculture or agricultural botany and a sound grasp of statistics, particularly those concerning crop sampling, or a degree in mathematics with experience of statistical techniques and some knowledge of and interest in biometry or botany) in the Department of Soil and Land-Use Survey, Gold Coast Local Civil Service, to collect field data for the various crops grown on different soils—The Director of Recruitment, Colonial Office, Great Smith Street, London, S.W.1, quoting CDE.79/13/03.

Demonstrator in Botany—The Registrar, Wye College (University of London), near Ashford, Kent.

Design Engineers (with recognized engineering apprenticeship with A.M.I.Mech.E. or equivalent, and experience of special purpose machinery or chemical plant design) in the Department of Atomic Energy, to undertake duties of project engineers, including design and layout of special plant and equipment—The Department of Atomic Energy, Industrial Group Headquarters, Risley, Warrington, quoting 614.

Graduate Chemist or Metallurgist for work which involves laboratory and field trial studies of the causes and prevention of corrosion of iron and steel and the application of results obtained to practical causes—The Personnel Officer, British Iron and Steel Research Association, 11 Park Lane, London, W.1, quoting "Corrosion".

Honours Graduate (qualified bacteriologist, or chemist with a sound bacteriological training) in the Bacteriology Department, for work on disinfection involving a study of methods of evaluating chemical sterilizers—The Secretary, National Institute for Research in Dairying (University of Reading), Shinfield, near Reading, quoting 54/6.

LECTURER (with a good honours degree, teaching experience, and preferably other postgraduate, industrial or research experience) IN PHYSICAL CHEMISTRY at Leeds College of Technology—The Chief Education Officer, Education Offices, Leeds 1.

MASTER or MISTRESS to teach biology throughout the school up to university entrance standard—The Headmaster, School House, Keswick, Cumberland

MINERALOGIST CHEMIST (with a first- or good second-class honours degree in geology or chemistry, and experience in the analysis, identification, study, etc., of mineral species) in Tanganyika (Her Majesty's Colonial Service)—The Director of Recruitment, Colonial Office, Great Smith Street, London, S.W.1, quoting BCD.105/8/04.

PETROLEUM CHEMIST (graduate of a recognized university in chemistry or chemical engineering), to supervise analyses and tests of petroleum products used in aircraft, such as gasoline, jet fuels, engine lubricants, coolants and hydraulic oils—National Research Council, Scientific Liaison Office, Africa House, Kingsway, London, W.C.2.

PROFESSOR (with a degree in chemistry, and teaching experience, preferably in a medical school) OF GENERAL CHEMISTRY, at the Royal College of Medicine, Baghdad—A.S. 12, Almack House, 26–28 King Street, London, S.W.1, quoting A.12/MH/546/IRQ.

RESEARCH ASSISTANTS IN THE DEPARTMENTS OF BOTANY AND ZOOLOGY, CHEMISTRY, MATHEMATICS, METALLURGY (including GEOLOGY) and PHYSICS—The Secretary, Sir John Cass College, Jewry Street, Aldgate, London, E.C.3.

SCIENTIFIC OFFICERS (with a first- or second-class honours degree or equivalent, in mathematics or physics), in London and the provinces, for operational research on a wide variety of problems, under the direction of the Scientific Adviser to the Air Ministry—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S.W.1, quoting A 285/52/A.

HUMAN RELATIONS IN INDUSTRY

THE Committee on Human Relations in Industry was appointed in March 1953, following the disbanding in 1951 of the Human Factors Panel of the Committee of Industrial Productivity. It was appointed by the Medical Research Council and the Department of Scientific and Industrial Research, "to examine current activities concerning the study of human relations in industry and to call attention to problems of special timeliness and promise on which research, including applied research and field study, might be undertaken or supported by the Department of Scientific and Industrial Research, the Medical Research Council or other bodies". The first report of this Committee (London : H.M.S.O. 1*s*. net) covers its work for the period March 1953–March 1954, and records approval of twelve projects out of seventy-eight applications received, for which funds totalling £89,000 have been committed. Only two of these projects—Prof. O. L. Zangwill's inquiry in the Psychological Research Laboratory at the University of Cambridge and that under Prof. R. M. Titmuss in the Department of Social Science and Administration at the London School of Economics, on the employment of married women as part-time workers in a London factory—are financed by United Kingdom funds. The remaining projects are being financed by funds made available under the Conditional Aid Programme and derived from United States economic aid.

When the Committee was appointed, it was intended that a programme of research should be built up progressively over several years, and in anticipation of a wide programme of work sub-committees were set up for five broad fields of research: incentives; management organization; promotion and training ; technological change ; and special groups in industry. By critical examination of research proposals prior to discussion on the main committee, these sub-committees have permitted a much more thorough and detailed consideration of such proposals than would otherwise have been feasible in the time available. They have also facilitated informal discussions, both before and after the approval of projects, with members of research groups, and sometimes with members of organizations interested in the results of research in the human relations field. The Committee rightly believes that such direct contacts and informal discussions should contribute to the speedy application of results of research. They could also prevent the initiation of sterile projects or those unlikely to yield information which could not be better obtained by other means. Some scepticism may well be felt as to the value of a pilot research scheme into incentives for management or of a study of the flow of information in industrial organizations, with special reference to the making of decisions relating to production.

It is difficult to comment at this early stage on the value of the initial programme in the light of the information given in the present report. The examination of factors affecting the utilization of university graduates in industry, to be carried out by Political and Economic Planning with Conditional Aid Funds, may well go far beyond what university appointments boards, even when generously staffed, could be expected to do in their day-to-day activities. One part of this inquiry, for example, will endeavour to establish what proportion of arts and science graduates are entering defined sectors in industry, why they are doing so, and what use is being made of them. Another part is concerned rather with the technical colleges, and will seek to indicate ways in which the management needs of local industry can best be met by a technical college.

The one common feature of the projects thus initiated with financial assistance available through Conditional Aid Funds appears to be that the projects can be expected to show some tangible result of practical importance to productivity and industrial efficiency fairly soon, at least by the end of the Conditional Aid programme. Such a condition at once suggests the danger that the Committee's work may be planned too much with the view of short-term rather than long-term needs. Moreover, it is in precisely such conditions that there is the gravest risk of promoting projects of dubious value. Short-term needs are those of which industry itself is most aware and ready to finance itself. Further, where industry has borne no direct responsibility for the financial support of such research, it is apt to be slow in utilizing the results.

That risk may well be inherent in the financing of research in this field generally by Conditional Aid Funds; but the extent of that risk will depend somewhat on the conception of the relation between productivity and human relations in industry which guides the Committee. Wisely, the Committee has rejected any narrow approach to welfare in industry in the sense of merely improving the amenities of work. Its consideration and choice of projects has, on the contrary, been based on the broad conviction that greater satisfaction in work is both compatible with, and essential to, increased efficiency and productivity.

That conviction derives a good deal of support from the work of Elton Mayo and from the studies in management by J. F. Scott and R. P. Lynton for the British Institute of Management and by Dr. W. H. Scott, of the Department of Social Science in the University of Liverpool, on human relations in Merseyside firms; and it probably provides the justification for associating the Medical Research Council with the work of the Committee. Apart from this, the Committee has attempted to base its research programme on matters of direct concern to industrialists and trade unionists, and has taken every step to ensure that its projects have been properly discussed by the research workers with the managements and trade unions concerned. Research into the human relations problems of industry is relatively undeveloped in Britain, and there is a great need over the next few years to raise scientific standards and to improve research methods and the quality of work in this field generally from the scientific point of view. The practical value to industry of research in this field has yet to be demonstrated convincingly in Britain, and the Committee recognizes that a major and sustained effort will be needed to relate the researches to the needs of industry and to ensure that the results are applied to the maximum extent possible.

That being so, caution in the approval of projects is amply justified. The Committee itself recognizes that supply and training of research workers in this field set limits to what is practicable in the way of projects; and it indicates its intention of considering these questions and also the careers available for such workers, particularly from the point of view of combining competence in research with industrial experience. It also proposes to examine further the means of assessing research needs and of co-ordinating research projects; and on what is set forth in this report, the Committee's scrutiny and approval of research projects would appear likely to be increasingly realistic and sensible, provided only due regard is had to the danger inherent in the initiation of projects which industry could fairly be expected to undertake for itself, and to that of assuming that some formula or scientific prescription can be found which will solve any human problem in industry. No narrowing of the field within which decisions can be based on factual knowledge will eliminate the decisive importance of personal judgment.

There is, however, one broad field, in which the Committee has already approved some four projects which should repay all the study it can receive. In this field—the study of the human factors facilitating and restricting the introduction of new production techniques and methods—the project under Prof. Zangwill, being financed by United Kingdom funds, has already been mentioned. Besides this, a study, under Prof. T. S. Simey at the Department of Social Science, University of Liverpool, of technological change and social organization in industry, one of change and adaptation in industry, under Mr. T. Burns at the Social Sciences Research Centre, University of Edinburgh, and a comparative study of some production systems in mining by Dr. A. T. M. Wilson at the Tavistock Institute of Human Relations, London, have also been approved and are being supported by Conditional Aid Funds.

Human problems may readily retard or prevent changes that are necessary to enable the community or industry to reap the benefit of some technical advance, and the Committee rightly stresses the extent to which the competitive position of British industry in the world's market depends on the more rapid and effective introduction of new techniques, new materials or new methods of production. The projects already approved do not cover all the important aspects of this problem, and the Committee is well aware that many of its elements cannot be isolated. While it is endeavouring to commission research which covers both the economic and the social factors involved in the adoption of technical innovations, a joint Science and Industry Committee has been established by the Royal Society of Arts, the British Association for the Advancement of Science and the Nuffield Foundation to investigate the possibility of speeding up the application to industry of the results of research. This Committee, which also has received a grant from Conditional Aid Funds, is to survey research already under way elsewhere in order to see what further study is needed. Its terms of reference include also the identification and assessment of those factors which determine the speed of adoption of particular technical innovations and the correlation of those factors with the characteristics of the firm or industry; the collection of evidence on the effectiveness of measures already taken to expedite the application of science in industry or to remove hindrances to such application; and examination of the possible results of other proposed measures.

It is disturbing to find that even in this field, with a single exception, the projects so far initiated depend for support upon Conditional Aid Funds. The Committee appears to recognize that this position is not sound, but its remark that over the next few years its major task will be to build around the Conditional Aid researches a balanced programme of social science research related to the needs of industry in Britain and financed from British Government funds would be more reassuring without the qualification "as and when these are made available". Even if we accept it as proper that such work of industrial importance should be financed entirely from Government funds without industrial contributions, such an attitude is too acquiescent in a position which can scarcely be regarded as wholly consistent with British self-respect. The generosity of the United States would be more fittingly acknowledged by some immediate and substantial appropriation from our own resources for research.

It is clear from the present report that the Committee is already concerned to determine the correct balance of effort between projects designed to assist the assimilation by industry of existing knowledge, short-term applied research and such fundamental studies as have just been stressed. The Committee may well require the clearly and firmly expressed support of industry and the world of science if it is to succeed in inducing the Government to make available at an early date the funds required to remove the present dependence on external resources. Meanwhile, its commendable caution in the approval of projects should keep those actually initiated well within the capacity of the trained research workers already available, and it appears that there is no intention of excessive expansion before that supply is appropriately increased. Further, the steps already taken to secure the effective co-operation, not only of research workers but also of research institutions, industry and other organizations interested in this field, should ensure that no spurious projects are promoted, but that the investigations set on foot have due regard to the limits as well as to the possibilities of a scientific approach. Attention must also be given to alternative methods which may sometimes provide a speedier, cheaper and pragmatic solution to problems in which scientific or technical factors are only two of the aspects to be considered, and judgment and personality may be the determinants.

FELLOWS OF THE ROYAL COLLEGE OF SURGEONS OF ENGLAND, 1930–51

Lives of the Fellows of the Royal College of Surgeons of England 1930–1951

By the late Sir D'Arcy Power, K.B.E., F.R.C.S., and continued by W. R. Le Fanu. Pp. xii+889. (London: Royal College of Surgeons of England, 1953.) 42*s*.

THIS work is a continuation of the two volumes entitled Plarr's "Lives of the Fellows", which were published in 1930 and constituted a biographical record of the Fellows of the Royal College of Surgeons of England who died between 1843 (when an order of Fellows of the College was established by charter) and 1930. It was proposed at the latter date to issue a supplement every ten years; but the exigencies of the Second World War and a paucity of funds led to the postponement of publication of this recent volume until now—indeed, it was only the generosity of that distinguished surgeon, the late George Grey Turner, that enabled the publication to be undertaken. Once again the remarkable bibliographic gifts of Sir D'Arcy Power were at the service of the Council, as they had been when the first two biographical volumes saw the light of day, and Power wrote for this volume the lives of all those Fellows who died between 1930 and 1940, only giving up the task on his eighty-fifth birthday, when he presented a typed copy of his work to the President and Council. By a happy chance, also, the names of W. R. Le Fanu and Samuel Wood appear in the introduction to both the 1930 and 1953 works, so that a continuity of the same high standard has been achieved. W. R. Le Fanu has himself been responsible for all the memoirs of those Fellows dying after October 31, 1940; but he has also edited the whole of the recent volume, securing uniformity of presentation without altering the text of the senior author's memoirs already in typescript.

The book is attractively produced, and he who 'reads may run' with those who have made and advanced, and those who have practised, the surgery of the first half of the nineteenth century, since many of the great surgeons of international repute have lived on into the fourth and fifth decades with which this volume deals. The notes are biographical; in the introduction, Power states that the cardinal principles of short memorials are the verification of references, accuracy and the presentation of facts, and that "from Canon Ainger, once Master of the Temple, he had learned that in this type of writing the warning often inserted in obituary notices should be strictly followed: No flowers by request". This good advice has also been scrupulously followed by the present learned and courteous librarian of the Royal College of Surgeons.

Some of the notices, especially the earlier ones, may not seem to emphasize sufficiently the transcendental operative gifts of certain surgeons; but D'Arcy Power's chief interests were never so markedly centred on the art and craftsmanship of surgery although, in fact, at the Bolingbroke Hospital he was one of the very earliest operators to resect successfully a gangrenous intussusception in an infant, while the comparative appraisal of the operative skill of various surgeons was obviously beyond the orbit of Le Fanu. I am profoundly impressed with the vast amount of information collected by the authors about those names that figure in the text, nor is it only concerning surgeons who practised in Britain that the accuracy of the information can be vouched for from personal knowledge: the memoirs dealing with surgeons who practised in the Commonwealth countries furnish a wondrously accurate account and recall to me happy memories of lost friends.

Memory has been said to be an inspiration and incentive to those who labour in similar causes to-day: the perusal of the biographical notes in this volume cannot fail to be of profound interest and perchance inspiration to present-day surgeons and to others outside the surgical profession who find distraction in the stories of those who loyally and devotedly pursue "*Quae prosunt omnibus artes*".

GORDON GORDON-TAYLOR

DETERMINATION OF ADRENOCORTICAL STEROIDS

Memoirs of the Society for Endocrinology

No. 2: The Determination of Adrenocortical Steroids and their Metabolites. (Proceedings of a conference held by the Society for Endocrinology, at the Medical Society of London, on 21 May, 1953.) Edited by P. Eckstein and S. Zuckerman. Pp. vii+92. (London: Dennis Dobson, Ltd., 1953.) 12*s*. 6*d*. net.

THE second memoir of the Society for Endocrinology deals with factors influencing the estimation of adrenocortical steroids by means of their formaldehydogenic properties, with applications of paper chromatographic methods to adrenocortical steroid assays, with the use of sodium bismuthate to convert certain 17-hydroxycorticosteroids into 17-ketosteroids and with improved methods for the extraction of steroid conjugates from urine. In addition, the detection of a previously unidentified adrenal hormone is reported, and a study of the dehydroepiandrosterone output in adrenal virilism presented.

In the first two communications the formaldehyde-retaining properties of urinary extracts are described, a method for overcoming this obstacle to analysis introduced, and a study of the excretion of acid-labile and acid-stable formaldehydogenic steroids, as measured by this improved technique, reported.

Three of the communications are primarily devoted to methods of paper chromatographic analysis. In these the importance of tetrahydrocortisone as a metabolic product the excretion of which reflects the intensity of adrenocortical steroid metabolism is emphasized, and semi-quantitative developments of the paper chromatographic methods described. A useful account of some recent developments of technique in this field is included.

The use of sodium bismuthate in the estimation of 17-ketogenic steroids is described. This technique should prove of great value in that it avoids the large and variable losses inherent in those methods of estimation of the 17-hydroxycorticosteroids which require preliminary acid hydrolysis followed by extraction and estimation of formaldehydogenic or reducing properties. Improved methods are given for the quantitative extraction of steroid glucuronides and sulphates.

The isolation of weighable amounts of a new adrenal hormone 'electrocortin' is described in a communication which undoubtedly constitutes an important advance in the biochemistry of the adrenal cortex. This steroid has an activity some ninety times that of deoxycorticosterone. Indications of its chemical structure have already been obtained.

A method is given for the difficult estimation of 17-hydroxycorticosteroids in plasma, based upon separation on a magnesium trisilicate column and colour development with a phenylhydrazine – sulphuric acid mixture. Measurements of the output of dehydroepiandrosterone and related substances in the urine of patients suffering from adrenal virilism are reported. Such cases appear to be separable into two distinct groups upon the basis of the levels of urinary excretion of 17-ketosteroids and of substances which are chromogenic with the phenylhydrazine – sulphuric acid technique.

The discussions which follow the communications and conclude the sessions materially add to the interest of this volume, which will be valuable alike to the research worker interested in the adrenocortical steroids and to those who follow the rapid developments in this field with the view of their application to clinical problems.

N. R. LAWRIE

THEORY OF SYNTHETIC POLYMERS

Fundamental Principles of Polymerization

Rubbers, Plastics and Fibers. By Dr. G. F. D'Alelio. Pp. x+517. (New York: John Wiley and Sons, Inc.; London: Chapman and Hall, Ltd., 1952.) 80*s*. net.

THE number of volumes on the fundamentals of polymers and polymerization is increasing rapidly. Each is usually addressed to a defined reader, for the subject is not only of purely academic interest but is also important for those who have to deal in the industrial field with plastics, rubbers and synthetic fibres. The author is well known for his practical manuals on the preparation of synthetic polymers, and this volume, being theoretical, is complementary to the other books. It is addressed to those in industry who have to deal with the more fundamental aspects of polymers, and not so much to a physical chemist interested in the development of any particular branch of physical chemistry to polymer systems themselves. The arrangement of the book is somewhat unusual; but it is in conformity with the author's intentions in regard to his potential readers.

First of all there is a very general chapter, its object being to show the place that polymers occupy in relation to other kinds of matter, and the further sub-division of high polymers into plastics, rubbers and fibres. Then follows a chapter dealing in a descriptive way with polymerization reactions in general. Rather strangely the next chapter is devoted to a discussion of the evidence for the existence of macromolecules, a matter which was of interest but is now to a large extent of historical importance only. The properties of polymers in general are treated in one long comprehensive chapter in which the structure of the polymer molecule and the behaviour of the polymer substance are discussed in close relationship to each other. Having thus dealt with matters in general, the author then proceeds in the remaining two-thirds of the volume to examine in detail the processes of polymerization. Polycondensation and addition, reactions have chapters to themselves, and logically there is a chapter on the determination of molecular weights of polymers. Much is necessarily compressed into this chapter, and the intending experimentalist would need to refer to the original works for more detailed instructions on the use of the more complicated methods. Methods of following polymerization and a detailed discussion of the kinetics of free radical and to a lesser extent of carbonium ion reactions receive their proper place in the volume. The final chapter deals in considerable detail with the phenomenon of emulsion polymerization, which is, of course, of very considerable technical importance.

As will be seen from the above remarks, the order of presentation is in a way scientifically illogical; but for those who are interested in the more applied side of polymer chemistry the arrangement is more likely to be acceptable. Polymerization is an open field for nomenclature enthusiasts, and the author brings forward a number of definitions throughout the book. About the time of publication the High Polymer Commission of the International Union of Pure and Applied Chemistry published a recommended system as a result of prolonged discussion, and it is perhaps a little unfortunate that it was not possible for the author to see this document and adopt some of the suggestions. The book was completed in May 1952; but in some of the discussions, particularly on the mechanism of polymerization, the treatment is not quite so up to date as would be expected from the date on the preface. The volume is well printed and bound. Its price is on the high side for purchasers on the eastern side of the Atlantic.

H. W. Melville

BIRDS OF BURMA

The Birds of Burma

By Bertram E. Smythies. Second (revised) edition. Pp. xliii + 668 + 31 plates. (Edinburgh and London: Oliver and Boyd, Ltd., 1953.) 84*s*. net.

SEVENTY years ago, E. W. Oates published his "Birds of Burma", but the Burma of those days was restricted to that part of the country from Arakan and Pegu southwards. Shortly after the beginning of the present century the whole of Burma came under British rule, and the army officers, civilian officials and others took a great interest in birds. A new book has for a long time been needed, but it was not until a few years before the Second World War that Mr. H. C. Smith, a senior forest officer, planned the present work—or rather the original edition. Mr. J. K. Stanford undertook to prepare the letterpress, and the services of Commander A. M. Hughes, who was at that time stationed in Rangoon, were secured to draw the plates. Then the War came; Hughes and Stanford were recalled home, and though the plates were completed the manuscript was not ready. The present author, Mr. B. E. Smythies, came to the rescue, and by the year 1941 the book was published.

Owing to the War, few copies found their way out of the country, and before the end of the year the book was out of print. Shortly before orders were issued to evacuate Rangoon, Smythies rescued twenty-one of the thirty blocks for the plates and sent them to Calcutta. The original plates were saved by Mrs. Smith, but only through her sacrificing some of her personal belongings so as to keep within the 30-lb. allowance to evacuees flown out of Rangoon. When the Japanese arrived, they collected all the copies of the book they could find in Rangoon and elsewhere and sent them to Tokyo, only to be destroyed later when the building in which they were housed was struck by a bomb.

The new edition has been very considerably enlarged, re-written to a great extent, and brought up to date by Mr. Smythies when home on leave from Borneo, where he is now stationed. The climate and topography of Burma vary a great deal, and in the coastal region the annual rainfall is as much as 250 in., while in the dry zone—which covers much of the centre of the country—it may not be higher than 50 in. The author divides Burma into ten distribution areas, which are more-or-less the same as the civil divisions as shown on a map. As regards vertical zones of distribution, he defines the plains as from sea-level to 3,000 ft., the higher hills from the last elevation to 6,000 ft. and finally the mountains which in some cases go well above 7,000 ft., the highest peak being Loe Long (8,771 ft.) in the Shan States. The vegetation naturally varies according to the rainfall and elevation, and all this is clearly and concisely described in the introduction.

Owing to the geographical position of the country, the birds are of exceptional interest. In the north-west there are species from the Indian region, in the east there is a Sino-Himalayan element above 5,000 ft., and farther south there is a meeting with Indo-Chinese avifauna, while in the Tenasserim peninsula many Malaysian species are found. But taking the country as a whole, the fauna is made up of Assamese birds plus indigenous species; although many species from the adjoining regions penetrate far into the interior, on the whole the avifauna seems so far to have been little affected with the development of the country. It is true that the Burmese, or green, peafowl and some of the silver pheasants have decreased, from shooting and trapping, in the more populous parts of the country. The draining and clearing of a large dismal swamp area in southern Burma to grow rice have banished the spotted-billed pelicans and adjutants which used to breed there in great numbers, and now it is not known whether they nest anywhere in Burma. Writing of the adjutant in the early eighties, Oates described how each October they visited Pegu in great armies, and on first arrival could be seen all over the flat country in groups of fifty close together. In February and March they departed. But these great numbers are a thing of the past, as Mr. Smythies tells us, and though the bird appears to be widespread it is not common in most districts.

There is a short description given of each bird which, together with the plates, should be sufficient to name most of them. There are paragraphs on habits, food, nest and eggs, status and distribution. At the end of the book there is a systematic list with parallel columns showing the distribution of each species in the ten different areas. The thirty coloured plates, with a number of species on each, are a great asset to the book, and Commander Hughes is to be congratulated.

At the present time Burma is closed to ornithologists—which is unfortunate, since so much remains to be done. However, what we do know about Burmese birds has been ably brought together by Mr. Smythies, and the present edition is a great improvement on the first.

Bertrand Russell's Theories of Causation

By Erik Götlind. Pp. 164. (Uppsala: Almqvist and Wiksells Boktryckeri AB, 1952.) 16 Swedish kronor.

THIS clearly written manual is a good example of a type of composition the primary purpose of which seems to have been the clarification of the author's own mind on the complex subject of Bertrand Russell's treatment of causation. In fact, students of this theme will be grateful to Dr. Erik Götlind for committing his thoughts to print.

Dr. Gotlind begins by remarking that Russell's concepts have changed periodically in consequence of the fundamental upheavals which have occurred in physics during this century. It is this 'functional' relation between the more theoretical aspects of natural science and philosophy which these pages are designed to emphasize. Thus, the plan of the book is to take Russell's major works *seriatim*, and to elucidate his view of causation as events unfold. For example, in 1912, he is still, in the main, anchored to classical mechanics, but seems to be contemplating an abstract form of action at a distance, in which acceleration is dependent upon configuration, at a given instant. By 1914, however, causal connexions can bring events into relation with one another, implying finite temporal extension, a property previously excluded. Again, it is interesting to recall Russell's reluctance to admit (in 1936) Heisenberg's principle; by 1948, much of it had been accepted.

In numerous ways such as these, we gain a valuable insight into the progress over the years of the notion of causal laws. F. I. G. Rawlins

Selected Values of Physical and Thermodynamic Properties of Hydrocarbons and Related Compounds

Comprising the Tables of the American Petroleum Institute Project 44, Extant as of December 31, 1952. By Prof. Frederick D. Rossini, Prof. Kenneth S. Pitzer, Raymond L. Arnett, Rita M. Braun and Prof. George C. Pimentel. Pp. ix+1050. (Pittsburgh: Carnegie Press, 1953.) 7 dollars.

THIS massive progeny of "A.P.I. Research Project 44", a central agency of the American Petroleum Institute concerned with "collecting, calculating, and compiling data of interest to the petroleum industry, covering physical, thermodynamic, and infra-red, ultraviolet, Raman, and mass spectral properties of hydrocarbons and all related compounds", is, as its title reveals, a bench and office reference work—"tables of data . . . of greatest usefulness to engineers as well as chemists and physicists". It may be added that appeal is both to academic and industrial spheres concerned with petroleum and allied hydrocarbons. Components of this volume were obtainable on loose-leaf data sheets as distributed, once or more each year, when ready (the bound work is issued at five-yearly intervals), and this copy embraces all material on physical and thermodynamic properties up to December 1952.

The scope comprises an introduction containing constants, conversion factors and molecular weights of hydrocarbons. This is followed by tables of physical and thermodynamic properties; specific references for tables of properties; general references; index of properties; index of compounds; and finally publications of the A.P.I. Research Project 44. This is indeed scientific reference on the big scale, and it reflects unbounded credit on the team responsible for its achievement. Even if the reader in Britain is unaccustomed to, or troubled by, the small, neat but reduced type in which the contents are displayed, he may be consoled by the fact that, had normal type been employed, this thousand-page volume would have been doubled or even trebled in size, with corresponding increase in cost. H. B. Milner

Annual Report on the Progress of Rubber Technology

Institution of the Rubber Industry. Vol. 17. Pp. xii+174. (Cambridge: Heffer and Sons, Ltd., 1954.) 21*s*.

THE annual reports on the progress of rubber technology, issued by the Institution of the Rubber Industry, have established a reputation as a comprehensive source of information on current developments in every branch of the industry. The 1953 volume follows familiar lines. There are twenty-four sections, which include, in addition to the more obvious classes of manufactured goods, the problems of the plantation industry, the physics and chemistry of rubber, synthetic rubbers, textile fibres and fabrics used in conjunction with rubber, and the use of rubber in roads. Each of the sections is written by an expert in his field and contains a large amount of information in a highly condensed form.

Those sections which deal with the more scientific aspects of the subject are perhaps the least satisfying. The separate treatment, by different authors, of the chemistry and physics of raw rubber and the chemistry and physics of vulcanized rubber reflects an archaic outlook, and might with advantage give place to sections dealing with the chemistry of rubber and with the physics of rubber. This, however, is a minor criticism of a work which on the whole is well balanced, and which provides an excellent survey of present trends of technical development in the industry. L. R. G. Treloar

Wild Flowers of the Ceylon Hills

Some Familiar Plants of the Up-country Districts. By Thomas E. T. Bond. (London: Oxford University Press, 1953.) 17*s*. 6*d*. net.

THE purpose of this little book is to enable the non-botanist to identify, with the least possible trouble, the attractive flowering plants of the hill districts of Ceylon. To this end it contains an elementary key to a hundred and twenty species, mainly based on flower colour, supplemented by sketches of the plants themselves. The sketches are extremely important, since the preliminary subdivisions based on flower colour often involve the inspection of several—in one instance, no less than eleven—sketches in order to determine the identity of the plant.

On the line drawings, therefore, will depend the success of the book. These seem to be adequate for the purpose for which they were intended. The scale of the sketch is indicated by "the average size of the flowers (generally their diameter) in inches"; but there is no indication on the drawing whether the length or the diameter is meant, and it would have been better to have shown the reduction by a simple multiplying factor. The coloured frontispiece is poor: the colours are not correct, and there is no indication of size.

The letterpress is excellent, and a great deal of information about the plant illustrated, and often of other species, is given. The book can be recommended with confidence; it will very greatly add to the pleasure of visitors to the Ceylon hills. N. L. Bor

X-RAY STUDIES OF BIOLOGICAL MOLECULES*

By Sir LAWRENCE BRAGG, O.B.E., F.R.S.

THE diffraction of X-rays by protein molecules has been studied in the Cavendish Laboratory, Cambridge, for the past fifteen years. The first promising diffraction pictures of hæmoglobin crystals were obtained by J. D. Bernal, I. Fankuchen and M. Perutz in 1938. Previous attempts had met with little success, and the positive results of these three workers were due to the inspiration of keeping these fragile and collapsible crystals in their mother-liquor while taking the photographs, thus avoiding their turning into an amorphous state. Except for interruptions due to the Second World War, Perutz and his colleagues have continued to follow this line of investigation, and I have collaborated in the work owing to my interest in the X-ray diffraction problems it presents. The investigation has, during recent years, been financed by the Medical Research Council, and the generous support of the project by Sir Edward Mellanby and Sir Harold Himsworth has made it possible to build up a research team of chemists, physicists, biochemists and physiologists. One main interest has continued to be the hæmoglobin molecule. It is not uncommon for a student to spend a year or more in attempting to solve the structure of a crystal which contains some atomic arrangement of particular interest, but I can recall no other instance of an attack on one type of molecule which has been continued for so long as it has in this case; and indeed, it is clear that it must be continued for many years to come if all the secrets of its structure are to be revealed. I propose to describe here the difficulties of the problem, and to indicate the exciting possibilities of a deeper insight into the structure of living matter which ultimate success would seem to promise us, possibilities which have lured research workers in the Cavendish and in other laboratories to spend so much time and thought on the X-ray diffraction by protein molecules.

Protein crystals irradiated by X-rays give very perfect diffraction photographs, with an immense wealth of character shown by the positions and intensities of the various diffracted beams. A typical photograph is shown in Fig. 1. We have for many years looked at these pictures much as archæologists must have looked at the Egyptian hieroglyphics, longing for the clue which would enable them to be read. During the past two years Perutz and I have seen some pieces of the puzzle falling into place, and fitting together into fragments of an ordered scheme. During the past six months a line of attack developed by Perutz and his collaborators has shown the relation of these fragments to each other, and has enabled the pattern to be interpreted. It has been like the discovery of the Rosetta stone with its parallel inscriptions in hieroglyphics and known languages, which provided a starting-point for interpreting the hieroglyphics. It must be emphasized at once how very partial and restricted this success is. We only have the picture of the hæmoglobin molecule as seen from one direction, and to a low power of resolution still far from showing up individual atoms. The molecules are not completely separated from each other, since they overlap somewhat in a continuous row. There is still a very long way to go before a model of the molecule can be made with all the atoms in their right places, such as can be done when advanced X-ray analysis has been successfully applied to such molecules as sugar, strychnine or penicillin.

The difficulties which X-ray analysis encounters in studying complex bodies, and the rewards which are gained in the way of a deeper understanding when it is successful must now be briefly mentioned. In the early days of crystal analysis, the structures were solved by a process of trial and error. If we postulate an arrangement of the atoms in a crystal, it is always possible to calculate how this arrangement would scatter the X-rays and to compare these calculations with what is actually observed. If the structure has been guessed correctly, the intensities of the diffracted spots can be explained. In the earliest crystals to be analysed, like sodium chloride, the positions of the atoms were fixed by symmetry. One had only to choose between one possible scheme or another quite different one, and it was in this way that the simple chess-board-like pattern of sodium chloride was found to be the only alternative compatible with the observations. But a greater complexity arose in the case of another of the early crystals to be analysed, iron pyrites. Here the sulphur atoms were in pairs, and the symmetry alone did not tell us the distance between them. This distance was a variable which could have any value and still be consistent with the symmetry. In a recent review of the progress of X-ray analysis, Prof. P. P. Ewald quoted a letter which I sent him in 1914, in which I said that I had got the structure of iron pyrites but that it was "terribly complicated". Solving it meant that one had to try all positions for the sulphur atoms and see which fitted best. It is not really hard to do this for one variable or even two or three; but the difficulties increase very rapidly when there are several variables. It is like one of those combination locks on which there are a number of rings, each with

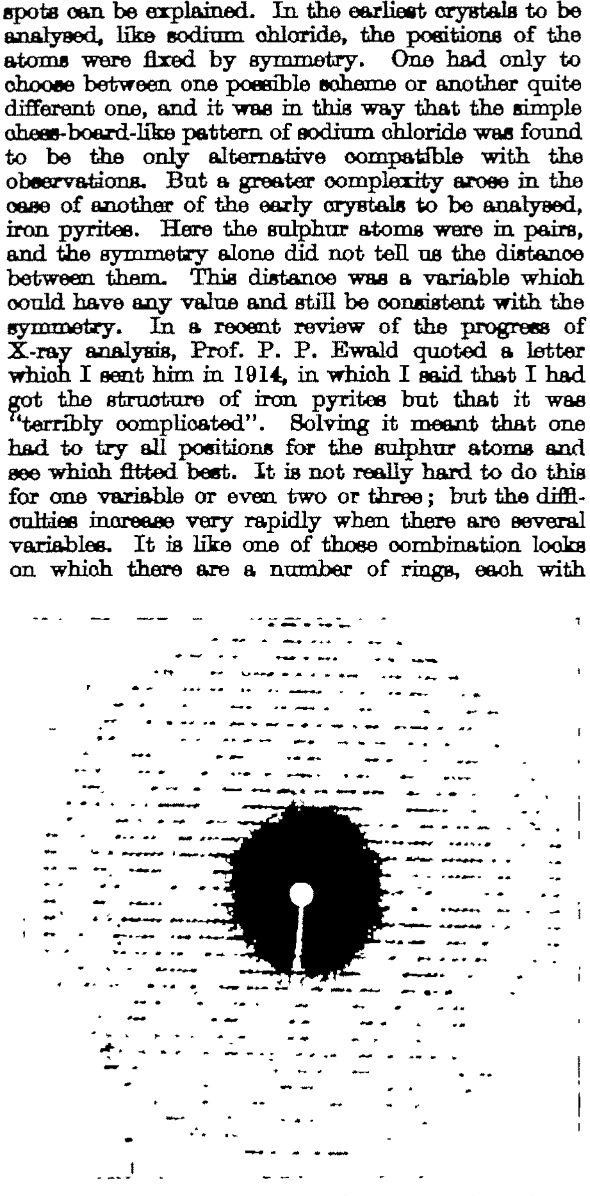

Fig. 1. X-ray diffraction photograph of a form of myoglobin (J. C. Kendrew)

several letters or numbers; every ring must be set at the right point before the lock will open. It would be easy to pick the lock if there were only one ring to try, or even two; but when there are half a dozen the possibilities are so numerous that the lock is proof against anyone who does not know the combination. After the First World War my research school at Manchester set itself the task of solving more complex crystals, and, when we claimed to have found the answer in cases with half a dozen variables, I still remember the scepticism with which our results were received. Our German colleagues, in particular, were very certain that one could not trust the answer when there were so many variables.

---

* Friday evening discourse delivered at the Royal Institution on January 29.

Since those days, there has been a very great advance in the art of X-ray analysis. Complicated molecules such as those of the sugars, the alkaloids, the sterols or penicillin have been analysed, although they depend on a hundred or more variables. Success in analysis is possible because guessing has become more clever, as the knowledge of the way atoms build together has increased. However, the process remains essentially one of trial and error. We try various positions for the atoms, like a burglar attempting to open a combination lock, and we know when we have picked it successfully because, generally quite suddenly, everything falls into place, and the hundreds of diffracted spots are completely explained.

What is the reward? It comes because X-ray analysis adds something of vital importance to what the chemists have already discovered about molecules. They have found what atoms enter into the composition of these molecules and in many cases which atoms are attached to which. X-ray analysis goes further in providing a working drawing or blueprint of the molecule, showing the precise position of the atoms in it, the distance between them and the angles between their bonds. It is this element of precision which is so important and gives a far deeper understanding of the physical properties of the bodies which these molecules build up, and the way the molecules can react with each other. Perhaps the most striking example of this was the analysis of the minerals which compose by far the greatest part of the earth's crust—the silicates such as asbestos, mica or felspar and, of course, quartz itself. The mineralogists who studied these substances had divided them into families with unknown relationships between their forms and a bewildering range of compositions. X-ray analysis showed a common pattern running through them all, the element of which was a tetrahedral arrangement of four oxygen atoms around a silicon atom. It is possible for the oxygen of one tetrahedron to be also a part of a neighbouring one so that the silicates can be thought of as made of tetrahedra which can be joined at their corners. Given this clue, the whole mineral world fell into place. One could see that the great families of minerals were the only ones geometrically possible and explain their precise form. The general scheme of the main substances which compose the earth's solid crust could be sketched on the back of an envelope—one of those glorious generalizations which provide such a scientific thrill.

What are the corresponding difficulties and the hoped-for rewards in the case of the biological molecules? The major difficulty is, of course, their complexity. It has been a remarkable X-ray triumph to solve the structure of organic molecules containing some fifty atoms; the molecule of hæmoglobin contains ten thousand. Nature would seem to need molecules of this vast complexity to do the very specialized tasks of living matter. Further, in the case of a sugar or a sterol, one can make a good guess from the start as to what it should look like, basing it on the findings of the chemists and on previous experience with similar molecules. In the case of a protein molecule we are still very largely in the dark. The chemists have told us something about its structure, but its organization is a complete mystery. To attack by X-ray analysis structures which have this complexity of quite a different order is therefore a venture into a new field. Trial and error methods are hopeless, as any burglar would agree, faced with a combination lock with ten thousand rings on it. New techniques must be found. The reward to be hoped for if the search for the structure is successful is, of course, a greater understanding of the properties and behaviour of these molecules. By analogy with the far simpler silicates, we may be able to see why the geometrical demands of the kinds of arrangements permitted to the atoms make the method which Nature has employed the only one which could have effected her purpose in a living body.

The chemists have told us something about these strange bodies which build up living matter. I have called them strange because the way they are built seems at first sight to be so arbitrary, and it is hard to see why Nature should have been forced to use this particular way to achieve her object. The most important constituents are protein and nucleic acid in their various forms.

There are two ways in which one might picture a mechanic building a complex part of a machine which had to perform some very special function. He might take his raw material and fashion it on the lathe and milling machine to some very precise design, to interact in exactly the right way with other components; most mechanisms are of this kind. There is, however, another example of the designer's art which has become of immense importance recently, namely, the arrangement of condensers, inductances and resistances to be found in any radio or other electronic circuit. Here the components are all simple standard pieces, and the art lies in 'composing' them or putting them in the right relation to each other. The complexity in this case lies not in the precise fashioning of a single unit, but in the complex relationship of a number of simple units. It is this second way which Nature has chosen in building living matter.

Proteins are built by joining together in long strings quite simple chemical units, the amino-acids. One half of each amino-acid has always the same plan. This end has, as it were, a chemical hook and eye (that is, acid and basic group), so that the hook can be joined to the eye of its neighbour on its right and the eye to the hook of its neighbour on its left. The other half determines its character, being a small tag of a few atoms of a kind peculiar to that particular amino-acid. There are somewhat more than twenty different kinds of tag. One may compare them to the letters of the alphabet used by the printer, each being a small piece of metal of identical shape at one end, so that it fits into his forme, and with the letter stamped on the other end. In making a protein, Nature works like the printer, joining these letters in a special order to form words and sentences. Just as books of every kind are written with the same letters, so protein of all kinds is composed of these same twenty amino-acids; their special function, it would seem, is due not to some very special kind of complex molecule, but to the order in which these molecules are arranged along the 'polypeptide chain'.

Nucleic acids are also long chains of relatively simple units, the nucleotides. The unit appears to be a very strange one to have been chosen for the particular functions of nucleic acids in the body, which seems to be the determination of the character of the living matter and its handing on from one generation to the next. If the proteins are the machines which do the body's work, nucleic acids appear to be the machine tools used in fashioning them. The common part of each unit is a sugar with a phosphate group attached to it. The character-giving tag is either a six-fold ring or a six-fold ring joined to a five-fold ring, termed a pyrimidine or purine. Broadly speaking, there are only four kinds of these, and it would seem that they always join up in two specific kinds of pair. So, in fact, there are only two kinds of tag in contrast to the twenty-odd amino-acids. We might say that the message of the protein is like one conveyed in writing, whereas the message of the nucleic acid is written in the dot and dash of a Morse code.

I will now indicate in very general terms the way in which it has been found possible to interpret the diffraction pictures given by hæmoglobin. The hæmoglobin crystals have the type of symmetry which is termed monoclinic. They have a two-fold axis of symmetry, so that looking along this axis every element of structure on one side has its counterpart in an equal and opposite direction on the other. We have so far only considered the projection on a plane perpendicular to this axis, that is to say, what we would see if we were looking at the molecule in the direction of the axis. The symmetry is of great assistance in solving the problem.

When X-rays fall on the crystal and a photographic plate receives the diffracted beams, they appear as a complex pattern of spots of different intensities. In dealing with a projection as in this case, the problem is formally analogous to the action of a cross-grating, a regular pattern in two dimensions, which is diffracting monochromatic light. The units of the pattern scatter the incident rays, and the scattered waves build up into wave trains which form the spots. Having recorded these wave trains on the photographic plate, we must somehow try to interpret them and see what kind of pattern produces them. To understand how this is done in a very general way, imagine that we have made an animated cartoon of the process, a rapid succession of drawings of the waves falling on the pattern and being scattered. We should see the incident rays coming along, circular ripples being scattered by each atom, and these ripples combining together to form trains of waves going off in the directions of the different spots. Now imagine that, as we are projecting this animated cartoon, we throw over the lever of the instrument which makes the film run backwards. The trains of waves would start back from the spots, run towards the pattern and there, in a magical way, we would see them combine to turn into little spherical waves, collapsing on the places where the atoms are. So by starting the waves backwards we should see the projected pattern of the crystal by noting the points at which these waves collapse. This must be so because it is always possible to picture a reversal of the light beams in a diffraction problem.

Though, of course, we do not make animated cartoons, this corresponds to what is done in X-ray analysis. We measure the diffraction waves and then calculate mathematically how they would combine if produced backwards into the crystal where they originated.

There is, however, one major difficulty inherent in this process. To make the waves run backwards and reveal the crystal structure, we must know both their amplitudes and phases. The amplitude can be measured because the intensity of each spot is proportional to its square. But we must also start the waves backwards so that their crests and troughs arrive at the atoms at the right relative times, so that they interlace together to reveal the structure. This is expressed scientifically by saying that we must know the phases of the waves, and these phases cannot be measured experimentally. The problem is greatly simplified in the present case because for 'phases' we can simply say 'plus or minus'. This is so because of the symmetry which I have mentioned above. Since the structure is symmetrical about the two-fold axis, the waves which reveal it must be symmetrical; they must make standing waves with either their crests or their troughs at the places of the two-fold axis. So when we look at all the diffracted spots of hæmoglobin, we could solve the structure if we could label each of them with a plus or minus sign. It might at first sight seem easy to try different combinations of plus and minus signs for the spots. There are, however, some hundreds of them, and the number of combinations represented by 2^{100} (about 10^{30}) is very large indeed.

Two technical advances have made it feasible to determine these signs without uncertainty. One is possible owing to a very remarkable property of the hæmoglobin crystal. It can be made to swell and shrink like a concertina, while still remaining a perfect crystal, by altering the constitution of the liquid by which it is surrounded. When it swells, all the diffracted spots appear at smaller angles, and vice versa. Any given diffracted spot may be a 'plus' spot for one crystalline form, and then, as the concertina opens, it may dwindle away to zero and change into a 'minus' spot, because it represents a scattering by the molecule in a series of different directions. So by mapping out the strength of the spots for different stages of expansion and contraction, we can map out regions of alternative sign in the map which represents the way in which the hæmoglobin molecule scatters in different directions. We do not know whether any given one of them is plus or minus, but we can see whether they change from one sign to the other.

The last step has quite recently been made by Perutz. He has found it possible to attach two mercury atoms to the hæmoglobin molecule without altering the crystal structure. Now the way these two mercury atoms scatter is a very simple affair; they produce the well-known diffraction fringes, and it can be told at once whether they are giving a plus or minus contribution in any given direction. If in a place where the mercury gives a plus contribution, it is found that its addition increases the scattering, the hæmoglobin scattering must be plus too. If it decreases, then the hæmoglobin must have been minus. So by noting the differences made by the mercury, Perutz has been able to attach the right signs all over the diffraction picture, reducing the number of possibilities, 2^{100}, to one.

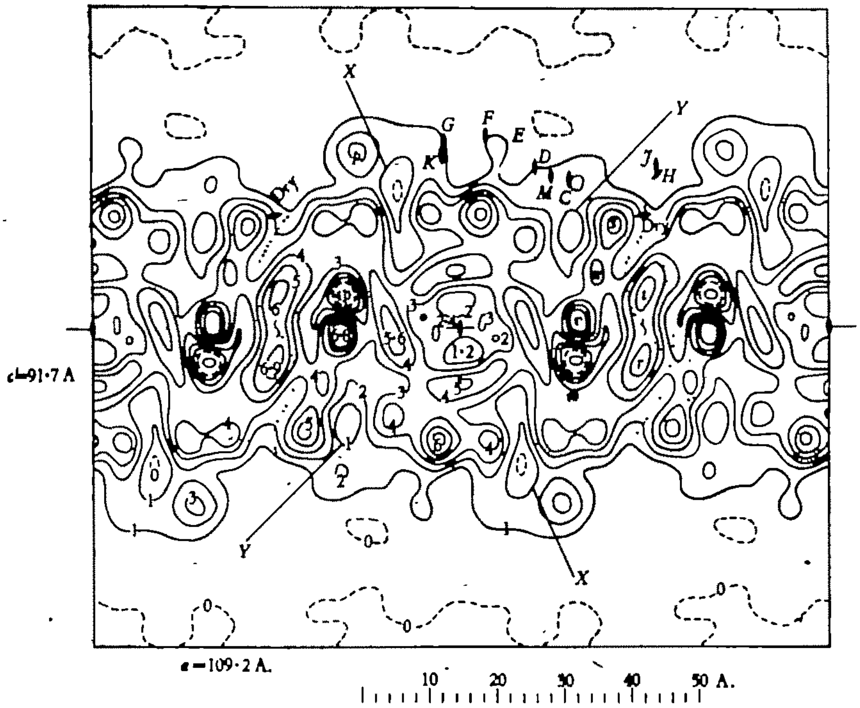

Fig. 2. Projection of a hæmoglobin molecule with two overlapping molecules to right and left. The density is represented by contours. Points where neighbouring molecules in the crystals touch are marked *G*, *F*, *H*, etc.

The rest of the solution follows at once. Knowing these signs, one puts together the waves with the right phase relation, and a picture of the hæmoglobin structure is the result. A picture of this kind is shown in Fig. 2. The masses of scattering matter in the molecules are shown in the way hills and valleys are shown on a map, by drawing contour lines through points of equal density. It will be seen how very incomplete and hard to interpret the results are as yet in this first picture of a protein molecule. In the first place, the resolution, in the sense that this term is used to describe the degree of detail of an image seen in the microscope, is still very low. The inner spots of the diffraction pattern are due to the broader grouping of masses in the molecule, whereas the outer spots arise from the finer details. In the present case only the inner spots have been used, and so the molecule is seen as a kind of diffuse picture with the atoms smoothed out so that they cannot be separated from each other. Now that the secret of analysis has been found, there would appear to be no difficulty in the way of using all the spots in the picture and getting much more detail. In the second place, though the wide variation of the *c* spacing makes it possible to sort the atoms apart in that direction, the crystal does not expand or contract along the *a* direction, which is horizontal in Fig. 2. The molecules overlap to a certain extent along the chain, and so it is impossible to see exactly where one stops and the next starts. Only one crystal has so far been found where the *a* direction shrinks slightly, making it possible to get a hint about the dividing line between the molecules where they overlap. I have not attempted to give here a picture of the separated molecules, because the drawing of the dividing line is still so conjectural.

The structure of nucleic acid should be mentioned in passing, because it illustrates so well one of the main points I have referred to above. Nucleic acid is not crystalline, but by suitable manipulation the long chains can be coaxed into a semi-crystalline form in which they are approximately parallel. Very fine photographs of a form of nucleic acid (deoxyribonucleic acid), prepared by Dr. M. F. Wilkins, have been obtained in Prof. J. T. Randall's laboratory at King's College, London. Quite recently, an X-ray interpretation of this nucleic acid chain was put forward by J. D. Watson and F. H. C. Crick, the correctness of which is strongly supported by the available evidence. The chains are double, the structure being like a spiral ladder with the sides formed by alternate sugar and phosphate groups and the rungs each composed of a purine hydrogen-bonded to a pyrimidine. The special point made by Watson and Crick, to which I should like to refer here, is the peculiar relation of the two kinds of pair, or tag, already mentioned. The two bonds where a rung is linked to a sugar at either end come out at exactly the same positions for either pair turned either way round. It is as if this pair which makes the rung of the ladder were a small bit of 'Meccano' which always just fitted in whichever way round it went. Now it appears highly probable that Nature writes the story of the gene, the hereditary element in the nucleus, by arranging these two pairs in some kind of order along the chain, like a Morse message in dot and dash. For this it is essential that either a dot or a dash may be a rung of the ladder. Is there not perhaps a hint here that Nature had to use phosphate groups, sugar, purines and pyrimidines, because nothing else would do to satisfy such rigid geometrical requirements ?

The main point I wish to make, therefore, is that success in analysing biological molecules by X-rays may explain to us why they have the structure they have. To make a comparison once more with the mineral world, we see that silicon and oxygen together build very stable structures which are light and have a high melting point, and that is why most of the earth's crust is made of silicon and oxygen. Their tetrahedral frameworks conveniently accommodate certain other metal elements, and correspondingly it is found that these rank next to silicon and oxygen in order of frequency of occurrence in the rocks. On the other hand, carbon, nitrogen and oxygen, together with hydrogen, build structures which are relatively unstable, but which are capable of an infinite complexity. This is so because the atoms are fastened together by bonds which have definite positions. Hence Nature has used these elements to make the complex structures of living matter. Now, as in the case of the silicates, we shall perhaps be able to see further into the reason for the arrangements of these elements which Nature actually uses. If in due course we make a voyage to Mars by a rocket-ship, we can confidently predict that mineralogy will be very much the same on Mars as it is on this globe of ours. If we find life there, however, the plants and animals would undoubtedly be of quite a different kind; there is no reason to think they will have developed in a parallel way to ours. But it is quite likely that these strange creatures will be built of protein and nucleic acid, with just the same amino-acids, purines and pyrimidines as Nature has found essential for her purposes here. At any rate, H. G. Wells thought so, for his "The War of the Worlds" gives a ghastly description of the invading Martians capturing and feeding upon the inhabitants of this planet, and how humanity was saved because the Martians succumbed to the bacteria from the attacks of which we had become immune. The Martian could not have assimilated his prey nor fallen a victim to the bacteria unless he were built up of the same proteins as all living matter on this globe. With a prophetic insight Wells appears to have realized that the strange and wonderful way in which we are made is not a matter of chance but is a result of the nature of matter itself.

INTERNATIONAL COMMITTEE FOR BIRD PRESERVATION

THE ninth international conference of the International Committee for Bird Preservation was held at Scanfs, Ober-Engadin, Switzerland, during May 23–26, and was attended by representatives of the following national sections: Australia, Austria, Belgium, Canada, Denmark, France, Germany, Great Britain, Iceland, India, Italy, Japan, the Netherlands, Norway, Sweden, Switzerland, the Union of South Africa, the United States of America and Venezuela, together with representatives of the Conseil International de la Chasse and the International Union for the Protection of Nature, and observers from the Irish Republic and Luxembourg.

One of the most important subjects dealt with was the prevention of the pollution of the sea by waste oil, in which the International Committee for Bird Preservation has taken a leading part for many years. The results of the international conference convened by the British Government during April 26–May 12, with the details of the international convention agreed at that conference, were reported, and the fact that (up to May 18) eleven countries had signed the convention, subject to acceptance, was noted with satisfaction. Proposals for immediate action in order to secure the implementation of the recommendations of the London conference and to secure further information for the future conference envisaged were discussed. It was agreed that the support of all other interested organizations and individuals (such as fisheries, pleasure resorts and hotels, yachting clubs as well as animal and nature organizations) should be secured, and that governments be urged to sign and ratify the convention. to carry out so far as possible the resolutions attached to the convention, and to secure the effective enforcement of the requirements by adequate penalties and supervision. In addition, it was agreed that the keeping of a careful record of the extent of oil pollution on the coasts should be organized, especially with regard to the effectiveness or ineffectiveness of zones, and to promote scientific research on the effect of oil pollution on all marine life, more particularly in respect of fish and plankton, not only in the vicinity of the coasts but also in the ocean, and research on the persistence of the different oils. It was also agreed: to carry out active propaganda to keep the subject of oil pollution before the general public and governments; to give strong support to the recommendation that a further conference be held to review the working of the new arrangements within three years, and that efforts should be made to ensure the inclusion of at least one biologist in each delegation; and to propose to countries concerned with whaling fleets that investigation should be promoted with regard to antarctic conditions, and the possibilities of avoiding discharge of oil by these fleets should be explored.

The representatives of the European national sections present reported on the situation with regard to the ratification by their respective governments of the International Convention for the Protection of Birds, Paris, 1950. Austria, the German Federal Republic, Iceland, the Netherlands and Switzerland stated that their governments were preparing to ratify the convention either in the near future or in the coming year, and at the end of the conference a telegram was received notifying that the Netherlands Ambassador in Paris had ratified the convention on behalf of that country. The representatives of the British Section were in the unhappy position of having to report that there was little chance of their country ratifying the convention, despite the high hopes that had been entertained when the joint proposals for new legislation left the hands of the Wild Birds Advisory Committees to the Home Office and Home Department for Scotland, the main difficulty being the refusal to follow the general trend of modern bird preservation in according the same protection to eggs as to the birds themselves.

Birds which are a menace to other species is an important question, and an international sub-committee to consider the situation with regard to the herring gull (*Larus argentatus*) in the countries bordering the North Sea was set up at the last world conference of the Committee held in Sweden in 1950. The reports of members of this sub-committee were submitted, in which detailed records of breeding colonies of these birds over a number of years were included. Opinions regarding the effect of this bird on other species were widely divergent, representatives from Germany and Holland strongly maintaining that in many places herring gulls were far too numerous and caused great destruction to other species, whereas the Danish ornithologists took the opposite view. Various methods which had been used in controlling the numbers of these birds were discussed, and finally the following resolution was agreed: "The Herring Gull (*Larus argentatus*) has increased, with the aid of disturbances in the balance of nature due to human interference, and in some countries, has, in certain areas, caused a diminution in the breeding populations of other sea-birds. This is only one of a number of biological factors involved, but it seems desirable to obtain the most accurate possible information about the status of the Herring Gull through an annual investigation of breeding pairs and of young reared in the North Sea south of the Skagerrak and the Firth of Forth and in the western Baltic Area. National Sections are invited to arrange such censuses, so far as practicable, according to circumstances in particular countries and to transmit the results of their censuses annually to the I.C.B.P.".

The preservation of wildfowl was dealt with from various aspects, beginning with a report of the work of the International Wildfowl Research Institute (in future to be known as the International Wildfowl Research Bureau), and detailed reports from the organizers of the national counts of wildfowl in Germany, Great Britain, the Netherlands, Sweden and Switzerland. Methods of wildfowl investigations and conservation in the United States were explained, and an account of the work being carried out in Australia was given, followed by more specialized papers such as that on the waterfowl of the Venetian lagoon by Dr. L. Leporati and a review of the situation of the brent goose (*Branta bernicla*) by Dr. Finn Salomonsen, of Denmark. Dr. Salomonsen spoke of the serious decrease in numbers of brent geese and the urgent need for measures to protect this bird, as the species is in danger of extinction. His remarks were supported by speakers from other countries, and finally a resolution was adopted urging the governments concerned to recognize that the brent goose at present be regarded as in danger of extinction, and recommending governments controlling its wintering and breeding areas as well as its migration routes to give it complete year-round protection as an emergency measure, to remain in force unless and until it becomes clear beyond possibility of doubt that the future existence of the brent goose is assured. It was further agreed that the International Committee for Bird Preservation should initiate a detailed international investigation into the status of the European brent goose.

The effect of international trade in plumage, cage birds and carcasses of game birds on the populations of the species involved was dealt with at length. The Venezuelan representative spoke of the difficulties being experienced by his country in preventing the export of feathers of egrets, which though prohibited is continuing illegally, to meet the demand of dealers in Europe. The delegates from India referred to the serious depredations in recent years on the grey jungle fowl (*Gallus sonnerati*) on account of the demand for its hackle feathers; though the bird is protected in India its feathers are being obtained by other countries. In order to assist in preventing the illegal export of birds' feathers from countries where they are protected, and Venezuela and India in particular, it was agreed that the European Organization for Economic Co-operation (O.E.E.C.) in Paris should be urged to remove from the list of merchandise the importation of which member countries have not the right to prohibit, feathers of birds protected in their country of origin, in particular birds of paradise and egrets (the feathers of domesticated birds not included). It was further agreed to recommend that all governments, especially that of the United States of America (where the greatest importation takes place) be urged to prohibit the import of feathers of the grey jungle fowl (*Gallus sonnerati*) from all ports in the Indian sub-continent, since the habitat of this species is peninsular India only, and the species has suffered serious depredation in recent years.

The Australian National Section put forward a resolution regarding the prohibition of the exploitation of live birds in view of the great increase in the exports of wild-caught birds from Australia, which is at present computed to be more than five times that in the years immediately preceding the Second World War, and in 1951–52 was estimated at 48,000 birds. A slightly amended resolution was adopted which recommended that governments of all countries be requested to restrict the export and import trade in wild-caught birds, and only to permit the export of rare and protected species in small numbers to zoos and *bona fide* aviculturists for scientific study and breeding.

The establishment of a series of reserves on migratory routes of birds, initiated at the meeting in Sweden in 1950, was reported upon and maps indicating the position of the reserves were supplied by various national sections.

On the proposal of the German National Section, a resolution was adopted calling for full protection of the white stork in those countries through which these birds migrate in autumn and spring, and on the request of the Danish representatives the black stork was included in this proposal. The need for the better protection of birds of prey was discussed, and the undue destruction of these birds was reported in particular by representatives from France and the Union of South Africa. The importance of birds of prey and the widespread misunderstanding of their value was generally agreed and a resolution adopted as follows: "The Conference learns with regret of the continuing indiscriminate destruction of birds of prey in many parts of the world. This is in conflict with modern biological knowledge regarding the essential part taken by birds of prey in maintaining natural balance of populations. The destruction of birds of prey in general is shortsighted and should be brought to an end, but it is realized that in some exceptional cases properly supervised control measures are sometimes necessary. The Conference recognizes the value of much of the legislation that has recently been enacted and commends the efforts of various governments to enforce such measures. The Conference urges that such measures should be further developed and fully enforced and that educational campaigns be initiated to inform the public of the biological importance of birds of prey". National sections were requested to make suitable representations to their governments to ensure that action is taken in each country in accordance with particular requirements.

Other subjects dealt with were species in danger of extinction. Representatives of various national sections spoke of their concern regarding their native species, among others mentioned being the great Indian bustard and the Australian bustard. The mass destruction of the red-billed weaver (*Quelea quelea*) in French West Africa and the Quaker parrakeet (*Myiopsitta monacha*) in the Argentine by means of fire was discussed; while appreciating that these birds have become pests in these countries, a resolution was passed advocating other less drastic methods of controlling them, and recommending that further investigations be made into the amount of harm caused by their depredations of crops. A report on the International Conference for the Protection of the Fauna and Flora of Africa held in Bukavu in October 1953 was given by Dr. Boje Benzon (Denmark), who had attended the meeting as an observer for the International Committee for Bird Preservation, and representatives of national sections presented reports on the bird preservation situation in their respective countries and on any new legislation that had been introduced.

THE PILTDOWN BONES AND 'IMPLEMENTS'

At a meeting of the Geological Society on June 30, there was again a series of exhibits concerning the bones, teeth and artefacts obtained from Piltdown. This was the third occasion of its kind within nine months. It may be presumed that it will be the last; for the Piltdown objects have lately been reinvestigated in such detail, by so many specialists using so many techniques, that there can scarcely be factual profit from further work upon them.

It is agreed that the skull fragments are human and not of great antiquity; that the jawbone is ape; that they have no important evolutionary significance. More than five hundred articles and memoirs are said to have been written about Piltdown man. His rise and fall are a salutary example of human motives, mischief and mistake.

The first exhibit at the meeting on June 30 was by Mr. A. T. Marston, who has long maintained that the Piltdown mandible and canine tooth are ape, and unrelated to the skull fragments; but who opposes the claim that the jaw and tooth have been deliberately faked. Mr. Marston showed a modern chimpanzee mandible which he had stained with potassium dichromate. It was yellow, in contrast with the chocolate-brown of the Piltdown jaw. He said that he had tried without success to reproduce the Piltdown colour by treating many modern bones with iron salts and chromate. He also contended, illustrating his remarks by specimens, that all the essential characters of wear on the Piltdown teeth are reproduced when articulated casts of orang jaws and teeth, mounted in an appliance to give ape jaw-movements, are 'ground-in' with carborundum paste; that the facet on the upper canine becomes concave from above downwards and spreads to the anterior border; that flatness comparable with that of the Piltdown molars is produced in the molars of the cast; and that the angles of wear on the molars of the cast and the original are identical.

Sir Gavin de Beer, director of the British Museum (Natural History), then introduced a series of exhibits and speakers on work which indicates, in sum, that the Piltdown finds represent a most elaborate and deliberate hoax, and that not one of them came genuinely from Piltdown. He summarized the methods which had been used, and pointed out that they would not only make a successful repetition of a similar style of forgery virtually impossible, but also would be of future value in palæontological research. Sir Gavin emphasized that the author of the Piltdown hoax remains unknown.

Prof. W. E. Le Gros Clark said that the molars in the Piltdown jaw differed from those of a modern large ape in only two significant features—the flat wear of the occlusal surfaces, and the shortness of the roots as seen in X-ray photographs published in 1913. New X-ray photographs had shown that the roots are in fact much longer, and quite similar to those of modern apes. The artificial character of the abrasion of the molars was demonstrated, *inter alia*, by the facts that the dentine on the antero-internal cusp is flat and flush with the enamel; that more dentine has been exposed on the antero-internal than on the antero-external cusps, the reverse of natural wear; that there is no bevel on the margins of the occlusal surfaces and the central talonid basin; that there is lack of conformity between the surface contours of the two molars; and that there are fine criss-cross scratches on them, apparently produced by an abrasive. The canine is evidently a young tooth, yet the whole thickness of the enamel has been removed from the inner surface crown. An X-ray photograph showed that its pulp-cavity had been opened near the apex and plugged with some plastic substance. Lastly, a re-study of the fragments of the so-called 'turbinal bone' showed that they are in fact fragments of a small limb-bone of some animal.

Dr. J. S. Weiner showed that by grinding and polishing the first and second molars of an orang, occlusal surfaces extremely like those of the Piltdown molars, with similar dentine pattern, can be produced; and that the height of the crowns is then almost identical. The chin region of an orang jaw, broken as in the Piltdown mandible, compares closely with the latter in all characters including the simian shelf. After abrading an orang upper canine to the state of the Piltdown canine, it had been easy to insert sand-grains from Piltdown into the pulp-cavity. Dr. Weiner remarked that the Piltdown canine contains very little of the fine sand or silt which one would expect natural infiltration of sediment to introduce.

An exhibit by Mr. S. H. U. Bowie and Dr. C. F. Davidson dealt with the implication of radiometric assays. Dr. Davidson said that during an investigation of the radioactivity of phosphate rock a few years ago, it was found that fossil bones and teeth often have a noteworthy radioactivity, apparently acquired from percolating ground-waters, and with a quantitative relation, taking account of variants of environment, to geological age. He exhibited a tabular statement of the ranges of radioactivity of a large number of bones from sands and gravels of various ages, and another showing the radioactivity of the Piltdown and Swanscombe primate bones. The Swanscombe measurement, 27(eU_3O_8 in p.p.m.), falls within the Middle Pleistocene range. The Piltdown primate fragments all have extremely low radioactivity: 3(eU_3O_8 in p.p.m.) for the left parieto-frontal I; 2, for the occipital I; 1, for the temporal fragment; and all others less than 1. It is possible that the feeble radioactivity of the chromium-bearing left parieto-frontal, and perhaps of other fragments, is due to the presence of the potassium isotope ^{40}K. From these assays, Dr. Davidson said, it appears that the '*Eoanthropus*' remains are Holocene rather than Pleistocene. Dr. Davidson showed that measurements on the other Piltdown vertebrate remains give a remarkably wide range of radioactivity. The three molars of *Elephas* cf. *planifrons* are all far more radioactive than any other British mammalian bones of Tertiary or later age which have been studied; and in an examination of similar *E.* cf. *planifrons* teeth from foreign localities, the same high order of radioactivity is found only once, in a specimen from Ichkeul, Tunisia. On the other hand, the two 'Piltdown' hippopotamus teeth, and some of the beaver bones, are less radioactive than any other Tertiary or Pleistocene fossils which have been examined from any British or foreign source. It seems certain that the bones of the Piltdown 'assemblage' had very different geological and geochemical histories.

Dr. G. F. Claringbull and Dr. M. H. Hey reported on mineralogical and chemical tests. Drillings from the Piltdown cranium were found, on examination by X-ray diffraction, to be mixtures of apatite and gypsum. Gypsum was later found in many other Piltdown specimens. Gravel and loam from the site, and ground-water nearby, were analysed by Dr. R. C. Hoather and Dr. C. Bloomfield and found notably low in sulphate content. But gypsum had also been found in a skull from Barcombe Mill in the C. Dawson Collection in the British Museum (Natural History); and in matrix adhering to this skull there were calcium and ammonium sulphates—though these were not present in freshly collected samples of matrix from Barcombe Mill. It had been thought possible that the gypsum arose from reaction during soaking of the bones in an iron salt to produce staining, and experiments were therefore made on white bone from a neolithic skull. A solution of iron alum even as weak as 2½ per cent produced a fairly full-brown colour accompanied by conversion of the apatite of the skull to gypsum. With ferrous sulphate solution the reaction was less, but there was some replacement of apatite by gypsum. No natural conditions (except perhaps close proximity of a sulphide ore-body undergoing active weathering) could be postulated to produce the same effect. It therefore seemed that the gypsum in the Piltdown specimens was in fact an incidental effect due to artificial treatment by iron solutions in order to produce brown staining.

Dr. K. P. Oakley was the last speaker. He said that other tests had confirmed that the Piltdown mandible is entirely recent. In addition to the nitrogen test, its organic content had been found to be the same as that of fresh bone; and by means of the electron microscope, Prof. J. T. Randall and Dr. A. V. W. Martin had shown that intact collagen fibres occur in decalcified samples of the mandible, whereas none could be detected in the calvaria. Dr. A. E. Werner and Miss R. J. Plesters, of the National Gallery, had reported that the black coating on the canine tooth is a paint of bituminous earth pigment, probably vandyke brown. Dr. Oakley said that the work of Drs. Claringbull and Hey indicates that both the Piltdown skulls I and II are fraudulent; and their composition shows that, unlike the mandible, they are sub-fossil though post-Pleistocene. There is a further complication: the right frontal of Piltdown II could anatomically, from its unusual thickness and histology, have originally been part of Piltdown I. Since analyses have shown that their fluorine/phosphate ratios are in agreement, it could be inferred that these right frontal fragments did belong to Piltdown I, and not to the thinner occipital fragments said to have been found with them. All the Piltdown flints figured as palæoliths, he said, show evidence of artificial iron-staining. Dr. A. E. Moss has estimated that the stain on the flint *E* 606 contains c. 0·1 mgm. chromium per sq. cm. A chip from the cortex of this flint showed that the staining is superficial, with pure white cortex beneath. Dr. Oakley said that the worked elephant bone is certainly fossil, but experiments have demonstrated that it could not have been whittled to its shape while it was a fresh bone, and he showed a fossil bone from the Swanscombe gravel carved with a steel knife to reproduce all the features of the Piltdown implement. From the chemical and other evidence it was judged that the Piltdown bones and teeth had been assembled from a wide variety of sources and that some of them were foreign. The low nitrogen and low fluorine content of the hippopotamus molar can be matched only by material from cave deposits, for example, in Malta [see also p. 65].

OBITUARIES

Prof. J. B. Buxton

Prof. James Basil Buxton, principal and dean of the Royal Veterinary College, died suddenly in his office at the Field Station, Streatley, Berks, on May 25. His death is a severe loss to the veterinary profession in Great Britain, of which he had been a leading figure for many years.

Born in 1888, the son of a veterinary surgeon, he graduated at the Royal Veterinary College in 1919 and, after studying in the University of Liverpool, was for a short time lecturer in hygiene at the Royal (Dick) Veterinary College, Edinburgh.

In 1912 he became the first veterinary superintendent of the Wellcome Physiological Research Laboratories under the directorship of Dr. H. H. (now Sir Henry) Dale, an appointment which afforded him ample scope for development and a congenial atmosphere for work. He there laid the foundations of a department which is noted for its achievements in the field of veterinary research and the control of animal diseases.

In 1922 Buxton joined the scientific staff of the Medical Research Council and was in charge of the Farm Laboratories at Mill Hill, where he organized the investigation into dog distemper which the Council undertook with the aid of *The Field* Distemper Fund. He designed the buildings in which to breed a supply of fully susceptible dogs for experimental use, and drew up the programme of work which was largely followed by Laidlaw and Dunkin in their classical studies on the disease. It was the successful outcome of this project which paved the way to the subsequent work on human influenza.

In 1923 Buxton was appointed to the newly created chair of animal pathology at Cambridge and became responsible for planning and staffing the Institute of that name then about to be established. Within a few years he built up an organization known throughout the world as a centre of research and a training ground for research workers from home and overseas. Among the studies on which he himself was engaged during this period special mention may be made of those on the double intradermal tuberculin test, the standardization of tuberculin and the value of B.C.G. vaccine as an immunizing agent against tuberculosis in cattle.

In 1936 he was elected to succeed Sir Frederick Hobday as principal of the Royal Veterinary College, and under him the College has made great progress as the result of improved staffing and organization. He deserves much credit for the skilful way in which he organized its work in most difficult circumstances when it was evacuated from London during the Second World War, and for the part he afterwards played in its being accepted as a School of the University of London.

Prof. Buxton had a long record of distinguished service to the National Veterinary Medical (now British Veterinary) Association and the Royal College of Veterinary Surgeons and was a past-president of both bodies. For some time he was chairman of the Examinations Committee of the Royal College, and it was largely through his initiative that the course of study leading to the M.R.C.V.S. diploma was extended in 1932 from four to five years.

His name will always be associated with the organization and development of veterinary research and education in Great Britain, in which he has played an outstanding part and thereby made a lasting contribution to the well-being of agriculture.

T. J. Bosworth

Commander J. Hennessy, M.B.E.

The sudden death, in his sixty-ninth year, on May 22 of Commander J. Hennessy, deputy marine superintendent of the Meteorological Office, is announced with regret. Commander Hennessy had been deputy marine superintendent of the Meteorological Office since 1919; but during the Second World War he was in sole charge of the Marine Branch of that Office, in the absence of the Marine Superintendent on active service.

Hennessy played an important part in the reorganization of the fleet of voluntary observing ships after the First World War. This was afterwards developed, in 1930, into the 'Selected Ship' system, whereby weather reports are received by radio from merchant ships all over the world at selected meteorological centres. This forms a modern development of the scheme introduced by Maury in 1855 for the collection of weather information from merchant ships.

Commander Hennessy played a considerable part in organizing the statistical treatment of marine meteorological data. In 1921 the Hollerith punched card system was adopted in the Marine Branch in order to facilitate analysis of the enormous amount of data in ships' meteorological logs which had accumulated and which had previously been laboriously extracted by hand. There is little doubt that without the aid of such a system the compilation of world-wide climatological statistics for all oceans and the resultant preparation of comprehensive marine meteorological atlases which was carried out during the War under Hennessy's direction—in consultation with the Admiralty—would have been an almost impossible task. Since the data used for these atlases covered as long a period as 1855–1939, account had to be taken of the frequent, but unavoidable, changes in international meteorological procedure and codes. The resulting atlases are probably the most accurate and comprehensive of their type in existence.

Among the other work with which Commander Hennessy was closely associated, the preparation of atlases showing the surface currents of the oceans, compiled also from ships' observations, and of atlases giving the distribution of sea ice may be mentioned. He also took a large share of the responsibility for fitting up the British and Norwegian ocean weather ships and the subsequent administration of the former.

Hennessy was a member of the Commission for Maritime Meteorology of the World Meteorological Organization. He was made M.B.E. in the New Year Honours for 1953.

Commander Hennessy not only possessed a square-rigged master's certificate but also had sailed as first mate in a sailing ship—the barque *Minivon*. He later served in steamships and was in command of the Northwest Transport Company's *Uranium*. During the First World War, as a lieutenant R.N.R., he served aboard the armed merchant cruiser *Carmania* and was present during her famous battle with the German *Cap Trafalgar*. He also took part in the Dardanelles landings, aboard H.M.S. *Hussar*, and was later in command of that ship.

Commander Hennessy will be much missed by his many friends in the meteorological world and in shipping circles. He had a very likeable personality; his outstanding characteristics were loyalty and devotion to duty and a fine sense of humour. He is survived by a widow and two sons.

C. Frankcom

Prof. F. London

Fritz London, who died on March 30 at the age of fifty-four years, belonged to those theoretical physicists who in the years between 1920 and 1930 began their first investigations under the guidance of Sommerfeld, and soon were able to make contributions of very great importance. In these years only a very few posts were available for theoretical physicists, and like several others, he aimed at first at a different profession. He took his Ph.D. in Munich in 1921 with a paper on philosophy and started to prepare himself for a teaching career. However, the attraction of theoretical physics overwhelmed his sober plans. His first paper appeared in 1925 (jointly with H. Hönl) and deals with the rules for the intensities of band spectra. Investigations of this type preceded the development of modern quantum mechanics which essentially was completed in 1927. In this year London met W. Heitler in Zurich, where they wrote their classic paper on the homopolar chemical bond. It led to the interpretation of chemical valence in terms of electronic spin and has remained the basic paper on which a vast amount of work by both physicists and chemists has been built. Further developments led to the theory of activation energy in chemical reactions; another important step was the recognition that the tetravalency of carbon is not due to its ground state but to an excited state. Investigation to a higher degree of accuracy of the forces between atoms led in 1930 (in a joint paper with Eisenschitz) to a quantitative understanding of the long-range forces known as van der Waals attraction.

London had spent the years 1928–33 in Berlin where he was *Privatdozent* at the University. In 1933 he went to the Clarendon Laboratory in Oxford and became interested in the old problem of superconductivity. His brother Heinz had just advanced interesting new ideas on this subject, and jointly they found a phenomenological description of the electromagnetic properties of superconductors known now as the London equations. It is on this subject that London has published several monographs which greatly stimulated both theoretical and experimental research.

In 1936 London went to the University of Paris as Maître (later as Directeur) de Recherche, and in 1939 at the beginning of the war to the United States as professor of theoretical (later of physical) chemistry at Duke University. In these years he again extended the subject of his previous interest. Superconductivity had attracted his attention to the high diamagnetism of certain molecules, on one side, and to the superfluidity of liquid helium on the other. In both subjects he found novel points of view linking up with his previous investigations on the structure of matter.

In 1948 he learned that he was suffering of a dangerous heart disease. Thanks to the devotion of his wife, this did not lead to a flagging of his activity and he continued with all his previous fervour in his investigations. The course of London's life was inevitably influenced by the political upheavals of the last few decades; but he moved through all these changes himself unchanged.

H. Fröhlich

NEWS and VIEWS

Chemistry at University College, London :

Prof. H. Terrey

Prof. H. Terrey retires from a University chair of chemistry tenable at University College, London, at the end of September. He will remain associated with University College and the Department of Chemistry there for a further period under the College title of special lecturer, thus continuing a connexion which began so long ago as 1912 (see *Nature*, May 10, 1952, p. 778).

Prof. R. S. Nyholm

Prof. R. S. Nyholm, of the Technical University of New South Wales, Sydney, has been appointed to succeed Prof. Terrey. He is expected to arrive to take up his new duties in the spring of 1955. Prof. Nyholm is a graduate of the University of Sydney. He was appointed an I.C.I. Research Fellow, and afterwards a lecturer, in the Chemistry Department of University College, London, in which he will now serve in his new, senior, capacity. He is distinguished mainly for his extensive and important work on both the structural and physical aspects of co-ordination chemistry.

Division of Animal Health and Production, C.S.I.R.O., Australia :

D. L. B. Bull, C.B.E.

Dr. L. B. Bull, the most senior chief of division of the Commonwealth Scientific and Industrial Research Organization, Australia, has retired from his post as chief of the Division of Animal Health and Production, after twenty years service with the Organization. He has been succeeded by Mr. D. A. Gill, formerly an assistant chief of the Division and officer-in-charge of the McMaster Animal Health Laboratory, Sydney (see *Nature*, June 12, p. 1123). Dr. Bull, who is sixty-five, was born in Auburn, Victoria, and graduated B.V.Sc. at the University of Melbourne in 1911, gaining his D.V.Sc. eight years later. He was appointed deputy chief of the then C.S.I.R. Division of Animal Health, and became chief in the following year. Under his guidance, the Division has become the most extensive of the Organization's establishments, with a total staff of 320 distributed among five main laboratories and eight field stations in different parts of Australia. His advice has been widely sought on the application of scientific method to investigations of problems of national importance, and he was appointed a member of the Australian National Research Council in 1932. He was elected an honorary member of the Section of Comparative Medicine of the Royal Society of Medicine in 1945, and was awarded the diploma of honorary fellowship of the Royal College of Veterinary Surgeons in 1951. He was made a C.B.E. in 1952.

In spite of the heavy administrative burden entailed in Divisional duties, Dr. Bull has continued his personal research work and in recent years has played a leading part in the study of such problems as mastitis in cattle, and copper metabolism in sheep and liver pathology in domestic animals generally. The spectacular success achieved in Australia since 1951 in the control of the rabbit through the agency of the virus disease myxomatosis is in no small measure due to his pioneering research on this problem during 1934–42. He was able to demonstrate not only the difficulties which stood in the way of the spread of the disease by transmission from rabbit to rabbit, but also the possibilities of transmission by means of insect vectors such as various species of Australian mosquitoes and the stick-fast flea. Dr. Bull will not be severing his connexion with the Organization, for he has accepted a senior research fellowship and will be continuing his researches in the field of animal pathology with particular reference to the liver.

United Kingdom Atomic Energy Authority

The following have been appointed members of the United Kingdom Atomic Energy Authority, which takes over the control of atomic energy developments in Great Britain on August 1 : Sir Edwin Plowden (chairman), formerly chief planning officer and chairman of the Economic Planning Board ; Sir John Cockcroft, director of the Atomic Energy Research Establishment, Harwell ; Sir Christopher Hinton, deputy controller of atomic energy (production), Ministry of Supply ; Sir William Penney, director of the Atomic Weapons Research Establishment, Aldermaston ; Sir Donald Perrott, chairman of the Interdepartmental Committee on Woolwich Arsenal ; Lord Cherwell, professor of experimental philosophy in the University of Oxford ; Sir Luke Fawcett, general secretary of the Amalgamated Union of Building Trade Workers ; and Mr. I. A. R. Stedeford, chairman and managing director of Tube Investments, Ltd. One other member remains to be appointed.

George Eastman (1854–1932)

George Eastman, one of the great pioneers of modern photography, was born in the village of Waterville, New York, on July 12, 1854, and in honour of the hundredth anniversary of his birth a postage stamp bearing his portrait is being issued by the United States Postmaster-General as one of the "Famous American" series. In addition, the Royal Photographic Society will be holding a commemoration exhibition at 16 Princes Gate, London, S.W.7, during August. At the age of fourteen, poverty forced Eastman to leave school and get a job as a messenger boy at 3 dollars a week. He first became interested in photography at the age of twenty-three and, after mastering the clumsy wet-plate process then in general use, turned his attention to the newly invented gelatine dry plate. In 1879 he received a patent for a plate-coating machine, and in the following year began to manufacture dry plates for sale. Within a very few years he substituted for glass his perfected system of roll film photography, and in 1888 brought out a greatly simplified camera which he called the 'Kodak'. With Eastman's box camera the amateur photographer merely pressed a button ; the finishing of the pictures was done in the factory. In 1889 Eastman produced flexible transparent film, and this was utilized by Thomas Edison to make cinematographic pictures. Eastman created a great photographic industry, which to-day as the world-wide Kodak organization has factories and experimental centres in Britain, the United States, Australia, Canada, France and Germany ; photographic products of all sorts and descriptions are manufactured. Eastman was also a pioneer in the field of industrial relations and a great philanthropist. In the early years of his firm, when he had earned a substantial amount of money, he made a personal gift to his employees, and later he instituted a wage dividend plan by which each employee shared in the firm's earnings. In 1919 he gave one-third of his own holdings of company stock, then worth ten million dollars, to his employees, and later he established the retirement annuity, life assurance and disability benefit plan for his workers. He gave dental clinics to London, Paris, Rome, Brussels and Stockholm, and large sums of money to educational institutions, so that in all he gave away more than one hundred million dollars.

The Piltdown Bones and 'Implements'

In view of the recent meeting of the Geological Society (p. 61 of this issue), a communication by Prof. M. F. Ashley Montagu, of the Department of Anthropology, Rutgers University (*Science*, 119, 884; June 18, 1954), in which he poses some pertinent questions, is of interest. He examined the original Piltdown bones in 1951, and now questions the presence of portions of a turbinate, since he cannot recall any instance in the annals of palæoanthropology of this extremely fragile bone ever having been recovered in a fossil hominid. He continues: "If it does naturally belong with the Piltdown bones, then it may be regarded as casting considerable doubt upon the antiquity of the Piltdown skull. . . ." After questioning other points, hitherto accepted as authentic, Prof. Ashley Montagu refers to the 'bone implement', saying: "It is highly probable that when this alleged 'bone implement' is carefully studied it will be found that the terminal facets were produced by a sharp metal blade probably of the Sheffield steel variety; in short, that this 'bone implement' is quite as much a fake as the mandible".

Registration of Chemists and Engineers in the United States

The United States National Science Foundation is to compile a National Register of Scientific and Technical Personnel, and recently it has received two grants for the registration of chemists and engineers, with which it is possible to make a start on the work. The registration of chemists will be undertaken by the American Chemical Society, Washington, D.C., and the Society is sending out questionnaires to an initial list of fifty thousand American chemists. In all, it is expected that information will be obtained from approximately sixty-five thousand chemists, and the details will be kept up to date by the Society. The registration information on each individual will include name, address, education, chemical specialty and current employment. Duplicate copies will be sent to the Foundation for statistical studies and to assist in the mobilization of scientists in time of war. The information will not be used normally for finding posts for, or placing scientists. The registration of engineers will be conducted by the Engineers Joint Council, New York. At present, no attempt will be made to obtain registration information on all the estimated half a million engineers in the United States, but this section of the Register will be limited to about twenty thousand leaders in all engineering fields. The selection will be based on "Who's Who in Engineering" and other sources. The list will be maintained up to date by the Engineers Joint Council.

At the present time ten professional societies or associations are collecting registration information for the Register, the estimated numbers of scientific workers who will be listed being as shown: American Institute of Biological Sciences, 40,000; Federation of American Societies for Experimental Biology, 10,000; American Veterinary Medical Association, 14,000; American Geological Institute, 18,000; American Psychological Association, 11,000; American Institute of Physics, 15,000; American Meteorological Society, 10,000; American Mathematical Society, 12,000; American Chemical Society, 65,000; and Engineers Joint Council, 20,000. The National Science Foundation expects the initial registration of all these classes of scientific workers to be completed by June 1955. Inevitably, some workers are classified in more than one field; but, although there is a danger of duplication of names owing to the decentralized manner in which the registration is being carried out, this is being avoided by liaison between the various bodies, and in the preliminary consolidation of the individual lists it is hoped to be able to eliminate most of the duplications.

The Botanical Survey of India

A scheme for the reorganization of the Botanical Survey of India has recently been approved by the Government of India. The main features of the scheme are: (1) The division of India into a number of regional groups based on phyto-geographic affinities, each under a regional botanist, who will be responsible for the survey of that region. The regional groups will be designated as north, south, east and west, with their headquarters at Dehra Dun or Lucknow, Madras, Calcutta and Poona, respectively. (2) Establishment of a central directorate under an officer who will be designated as the chief botanist, for co-ordinating the activities of the various regional groups and for implementing the policy laid down by Government. (3) The creation of a central botanical laboratory under a director at a suitable place in India, where the living plant will be studied in relation to its biology and its utility to the nation. (4) The maintenance of a Central National Herbarium which will house the 'type specimens' and a fully representative collection of the plants comprising the flora of India. (5) Maintenance of a botanical museum on modern lines in Calcutta.

All existing facilities in the country will be utilized to the fullest in the reorganized Botanical Survey. Collaboration with the universities and research institutions will be encouraged by making grants to staff and research students to conduct research on problems dealing with the flora of India, and for collecting material for the long overdue revision of Hooker's "Flora of India". Inclusion of university students in Botanical Survey explorations and the imparting of practical instructions in collecting and preserving of specimens is also envisaged. The Botanical Survey will search for new economic plants in the unexplored regions of India. The introduction of plants from outside India will also be the function of the reorganized Survey. The director of the Central Botanical Laboratory has been already appointed. She is Dr. E. K. Janaki Amal, who has graduated in the United States, worked at the John Innes Horticultural Institute, London, during the War, and spent several years in the Wisley Gardens of the Royal Horticultural Society.

Two Meteorites Found in Australia

The curator of the Western Australian Museum (Beaufort Street, Perth), L. Glauert, reports that two unusually large meteorites have been acquired by the Museum. Mr. E. C. Johnson, whose farm is about twenty miles south-east of Quairading, has presented what is as yet the largest known fragment of the

Youndegin meteorite (see Simpson, E. S., *Min. Mag.*, 25, 166; 1938), weighing 5,789 lb.; the other meteorite, which weighs 1,057 lb., has been given to the Museum by H. E. and A. G. Carlisle, and was found twenty miles from Rawlinna, on the Trans-Australian Railway crossing the Nullarbor Plain. Although their exact classification has not yet been determined, both are iron–nickel meteorites (siderites).

The Abbey House Museum, Leeds

In 1925 the Corporation of Leeds purchased the Abbey House, and under the direction of the Committee of the City Museums it has been transformed into an interesting museum. A guide, price 6*d*., to the collections has been issued. The guide is well illustrated and clearly indicates how the objects as now arranged are illustrative of the life and work of the people of the region from the Stone Ages in general and from the twelfth century in particular. The costume display is peculiarly effective in that it is supplemented by the Eleanor Williams series of costume dolls, which on account of the accuracy of their dress portrays vividly the fashions and foibles of our ancestors.

Museum of South Australia: Annual Report for 1952–53

The annual report for 1952–53 of the Board of the Museum of South Australia, Adelaide (pp. 12. Adelaide: Government Printer, 1954), directs attention to the fact that there has never been adequate funds to carry out field-work. This is all the more important on account of the great increase of agricultural and other activities and the consequent rapid decrease of the native fauna and flora. For example, during recent years the widespread laying from aeroplanes of baits for wild dogs has had a profound effect on the small marsupials. Notwithstanding the lack of finance, it is interesting to note that a grant of £A.300 enabled a reconnaissance trip to be made to Lake Callabonna to collect specimens of *Diprotodon*. As a result, this important genus is now represented by additional material, including a complete adult, a juvenile skeleton less pelvis and tip of tail, and two large skulls. A detailed report on this material is awaited with interest.

Training in Taxidermy

It is announced in the April number of the ***Museums Journal*** that arrangements have been made by the British Museum (Natural History) and the Royal Scottish Museum for training to be given in taxidermy to members of museum staffs as a preliminary to the examination for the Museum Association's Technical Certificate. Candidates, who must be on the staff of a museum, will be selected by the Education Committee and given training for a period of three months in one of the two institutions. In exceptional circumstances financial assistance may be considered. Applications should be sent to the Secretary of the Museums Association, Meteorological Buildings, Exhibition Road, London, S.W.7.

Floristic Studies

Systematic studies of the flora of tropical America by the Chicago Natural History Museum have been taken a stage further by the publication of another section of "Contributions to the Flora of Venezuela" (***Fieldiana***: Botany, 28, No. 3, 449–678, with line drawings, 1953; 4.25 dollars). This is the work of J. A. Steyermark and collaborators and deals with the orders "Ericaceae through Compositae". A floristic study of a somewhat different kind is that by H. Santapau on "The Flora of Khandala on the Western Ghats of India" (*Rec. Bot. Surv. India*, 16, No. 1, 1953; price Rs. 32 or 49*s*., from Manager of Publications, Delhi). This aims at being a complete Flora (flowering plants only), based on an intensive study of a small but interesting region situated on the western edge of the Deccan Plateau, some 116 km. from Bombay. In an introductory essay the general features of the region are described and matters of special ecological interest discussed. "The Vegetation of Jamaica", by G. F. Asprey and R. G. Robbins (reprinted from *Ecol. Monogr.*, 23, 359; 1953), is a study of plant geography and ecology of an island of special botanical interest. The general features of the island are briefly outlined, and the floristic features are then analysed and discussed under the headings of phytogeography and the varied formations and communities comprised in the flora. This monograph is illustrated by some good photographs, maps and vegetation profile diagrams. The authors conclude that the present vegetation of Jamaica enables a reasonably accurate reconstruction of the original vegetation to be made. They consider that the early descriptions of the island as being covered in dense jungles, with extensive lowland tropical rain forest, are not borne out by this survey.

Discovery

The June 1954 issue of *Discovery* retains the high standard which has been set by its editor, W. Dick, during the past ten years. Dr. W. E. Swinton contributes an imaginative but well-authenticated article on the possible flight mechanisms of pterodactyls which is admirably illustrated by some original line drawings. S. Rogerson links up the prehistory of Brandon in Suffolk with the 'knapping' or chipping of flint stones which is still carried on to-day, complete with a vocabulary which reveals its ancient origins. Britain's false-scorpions are the subject of an article by T. H. Savory, who describes not only their structure, habitat and behaviour but also ways of keeping and feeding them. Horticulturists should appreciate Dr. Kenneth Smith's account of the virus diseases which cause colour breaks in flowers as well as Dr. G. Haskell's description of the history and genetics of the raspberry. Another article deals with the early scientific work on platinum which was done in Spain some time before W. H. Wollaston produced malleable platinum around about 1805. The air correspondent to the journal discusses the atom bomb's effect on airplane design, while short leading articles deal with such varied topics as the future of British sociology, 'hibernation' in operating theatres, coal pumping and myxomatosis.

Earthquakes during March

During March there were some thirty-four strong earthquakes in the world, ten of which had magnitude 6 or greater, and three of these latter had magnitude 7¼. On March 1, at 3.40 a.m. local time, an earthquake was felt over an area in Australia of some seventy thousand square miles from Kangaroo Island to Melrose, near Adelaide; there was some property damage, but no casualties. On March 11 tremors of unknown origin were felt in Bridlington and adjacent places on the east coast of Yorkshire, which caused cracks in plaster, doubtful disturbances being observed on seismograms at the University of

Durham Observatory at 11h. 37m. 59s. and 11h. 38m. 38s., G.M.T. On March 29 one of the earthquakes of magnitude 7¼ occurred in the Sierra Nevada in the south of Spain. Extensive minor property damage occurred over a very wide area, but the maximum felt intensity was only about 4 on the Modified Mercalli scale. The shock was recorded at Edinburgh at 06h. 21m. 04s., G.M.T., and over a very wide area. More than a hundred observatories sent seismogram readings to Strasbourg, where the initial time of the earthquake was evaluated as at 16h. 17m. 09s., G.M.T., and the epicentre at lat. 37° N., long. 3¼° W. From the facts already mentioned, from arrival times at the various observatories, and from the observations that surface waves, if present, had extremely small amplitudes, it is considered that this earthquake had a very great depth of focus (600–650 km.). This is most unusual, since earthquakes with such great depths of focus have only previously been known from foci near the Pacific Ocean; none has previously been found in Europe since adequate instrumental recording began (say fifty years ago). The other shocks with magnitude 7¼ occurred on March 3 with an epicentre in Central New Guinea and on March 31 with an epicentre in the Arabian Sea; the only other shock with deep focus (550 km.) occurred in the Fiji Island region on March 6. Apart from the above, five of the thirty-four earthquakes were experienced in Europe.

Peaceful Uses of Atomic Energy

More than seven hundred scientists, working on the peaceful uses of atomic energy in thirty different countries, are to meet at Oxford during July 19–22 to discuss advances made in the past three years. They are to attend a conference organized by the Atomic Energy Research Establishment, Harwell, on isotope techniques. Developments in medical research and treatment, in industrial processes and in agricultural research will be discussed. Britain has become the leading exporter of isotopes to Europe, the Commonwealth and other countries outside the United States. Most of the materials come from Harwell; but at the Radiochemical Centre, Amersham, the work of a team of chemists specializing in the production of chemical compounds incorporating isotopes has been arousing world-wide interest. Orders at these two centres are now being dealt with at the rate of 15,000 a year, of which more than 5,000 are to other countries. In the past six years radioactive isotopes have been sent to forty-two different countries from the United Kingdom. The conference will be opened by Sir John Cockcroft, director of the Atomic Energy Research Establishment, Harwell. The sessions will be private, but further information can be obtained from the Secretary, Atomic Energy Research Establishment, Harwell, Nr. Didcot.

Royal Meteorological Society: Officers for 1954–55

The following have been elected officers of the Royal Meteorological Society for the year 1954–55: *President*, Dr. O. G. Sutton; *Vice-Presidents*, Prof. P. R. Crowe, Sir Charles Normand, C. D. Ovey and Prof. P. A. Sheppard; *Vice-President for Canada*, F. W. Benum; *Vice-President for Scotland*, Dr. A. E. M. Geddes; *Treasurer*, Dr. J. S. Farquharson; *Secretaries*, Dr. H. L. Penman, Dr. G. D. Robinson (librarian), R. G. Veryard and Dr. T. W. Wormell (editor).

Announcements

The following elections have been made in the Paris Academy of Sciences: M. André Couder, director of the Paris Section of the Service des Mouvements Progrès Stellaires, to be a member of the Astronomy Section, in succession to the late Prof. E. Esclangon; Prof. J. Kampé de Feriet, professor of fluid mechanics in the University of Lille, to be a *correspondant* for the Mechanics Section in succession to Prof. L. Escande, recently elected a non-resident member of the Section.

Mr. R. D. Edge, of the Cavendish Laboratory, Cambridge, has been appointed a Research Fellow in the School of Physical Sciences of the Australian National University, Canberra. He will work with Prof. E. W. Titterton on the 30-MeV. electron synchrotron which will shortly be erected in the Department of Nuclear Physics. This machine, which was in use at the Atomic Energy Research Establishment, Harwell, until recently, was given by the U.K. Government to the Australian Government for installation in Canberra.

Dr. Charles Kemball, demonstrator in physical chemistry in the University of Cambridge, has been appointed to the chair of physical and inorganic chemistry in The Queen's University of Belfast. The following have been made lecturers in the University: V. C. R. Ford (geography), J. Drewery (psychology), Dr. W. Schwarzacher (geology).

The thirty-third annual general meeting of Fellows of the National Institute of Agricultural Botany will be held at Cambridge on July 16; Sir John Russell is to address the meeting.

The Universities Federation for Animal Welfare will be holding a summer school, open to both members and non-members of the Association, at Knuston Hall, Northamptonshire, during September 18–25. The programme will include expeditions to the Animal Health Trust Research Station at Huntingdon and to an artificial insemination centre and to Cambridge, as well as lectures, discussions and social activities. A fee of 5 guineas, which will include full board and all the expeditions, will be charged (3 guineas for students). Application and all other communications should be sent to the local branch secretary of the Association or to Miss M. Williams, UFAW, 7a Lamb's Conduit Passage, London, W.C.1.

The Electrical Engineering Department of the Imperial College of Science and Technology, London, will hold a five-day vacation school on aircraft electrical systems during September 20–24. The course is designed for a maximum of sixty engineers who already have some experience in the design and application of aircraft electrical power equipment, the object being to bring out, partly by lectures and partly by mutual discussion, the scientific principles underlying the design and application of all types of equipment. The fee for the course (including lunches, refreshments, transport, etc.) will be eight guineas. Hostel accommodation is available. Further information can be obtained from B. Adkins, Department of Electrical Engineering, Imperial College of Science and Technology, London, S.W.10.

RADIO TELESCOPE AT JODRELL BANK EXPERIMENTAL STATION, UNIVERSITY OF MANCHESTER

ON June 10, representatives of the Press and others assembled at the Jodrell Bank Experimental Station of the University of Manchester to inspect the progress on the erection of the radio telescope. The reasons for building the telescope, which is sponsored jointly by the Department of Scientific and Industrial Research and the Nuffield Foundation, were explained by Prof. A. C. B. Lovell, and the engineering consultant, Mr. H. C. Husband of Sheffield, described some of the engineering problems. The essential feature of the telescope is a 250-ft. diameter steel bowl, paraboloidal in shape, 62·5 ft. deep at the focus. This is to be covered with a reflecting screen of 1 inch square mesh. This main bowl, weighing 600 tons, will be carried on two towers so as to pivot on a horizontal axis 180 ft. above ground. The drive for the elevation movement will be by 100-h.p. metadyne motors through 27-ft. tracks which were originally in the battleship *Royal Sovereign*. The two towers are each mounted on six bogies which move on a circular railway track. The bases of the towers are connected by a cross girder to the central pivot. The azimuth motion is obtained by an electrical drive from four of the bogies.

The foundations were completed by the end of 1953. They consist of a concrete ring supported on reinforced piles sunk to the keuper marl (in places up to 90 ft. below ground-level), which carries the 17-ft. gauge double railway track of diameter 350 ft. This railway track, which has to carry a superstructure weighing 1,500 tons, is level to $\frac{1}{4}$ inch, and in order to provide the necessary stability nearly 5,000 tons of steel and concrete have been used in the foundations. The central pivot, which is already in position, is carried on similar deep foundations. A sample of the twelve bogies on which the main steel framework is to be carried was also available for inspection. At the time of the visit, a 120-ft. crane mounted on 60-ft. gabbards was erecting the first of the main 15-ton 120-ft. jib cranes on 120-ft. gabbards, two of which are required to erect the telescope itself. The erection of the steelwork is expected to begin this month and to be largely complete by the end of the year. It is anticipated that the radio telescope will be finished in 1955.

The radio telescope was also discussed by Prof. Lovell in a Friday evening discourse at the Royal Institution on May 21. The need for such a large instrument arose from the desire to obtain high power gain and directivity in the investigation of the radio waves from space. In this the requirements are analogous to those of conventional telescopes. The significant advances in the study of the universe have been made through the medium of large telescopes. Successive increases in aperture, culminating in the great 200-in. on Mt. Palomar, have given more resolving power and more light-gathering power, thereby enabling more distant regions of the universe to be explored. The analogy in radio astronomy is very close; but since the wave-lengths are a million times longer than light, the radio telescopes have to be of far greater size than their optical counterparts. Prof. Lovell described how the new radio telescope would be used for investigating the extra-terrestrial sources of radio noise, or radio stars, so few of which have so far been identified with visible objects. Demonstrations were also given of the use of the radio telescope in the study of meteors, the moon, and of the complex relationships between events on the sun and the disturbances in the earth's ionosphere.

METHODS OF LAND-CLEARANCE FOR AGRICULTURE

ON April 20 a meeting arranged by the Agriculture Group of the Society of Chemical Industry was held at the Royal College of Science, London, to discuss the large-scale clearing of forests. Unfortunately, three out of the five speakers named on the programme were unavoidably absent; the subject-matter of two papers, however (those of R. H. Gunn and A. McBride), was incorporated by Dr. A. H. Bunting, of Tozi Research Farm, Singa, Sudan, into a joint paper entitled "A Review of Methods of Land Clearing".

Dr. Bunting began by pointing out that in many regions of the world land-clearing has always been a fundamental component of agricultural systems and is an integral part of the system of shifting cultivation still widely employed by primitive communities who grow their crops on patches where the bush or forest has first been cut down or burnt. In many tropical areas the nutrient status of the soil is so low that, under the existing conditions of management, only one or two crops can be taken from the cleared area, which is then abandoned and soon becomes covered by vegetation consisting in the main of regrowth from the roots and stumps of the cut woody plants. It is accepted that burning of the cut vegetation before cultivation gives rise to increased yields. The nutrient value of the ash is probably only one of several factors involved. Dr. Bunting stressed the need for further analysis of the function of bush fallow in restoring productivity. Recent work in the Sudan suggests that a type of erosion described as 'surface wash' of the exposed soil may be one reason for the rapid decline in productivity of tropical soils after the bush canopy has been removed. Under these conditions, the top few inches of the soil which may contain the bulk of the accumulated fertility can be washed away.

Modern methods of farming often demand a different type of clearing, involving the complete and large-scale removal of stumps and roots of the existing trees and bushes. Such large-scale clearance schemes are likely to include the following phases: survey of the area by aerial photography and ground observations, followed by the preparation of detailed soil and vegetation maps; production of a land utilization and conservation policy and construction of access roads and labour camps; cutting of the vegetation; disposal of debris; removal and disposal of stumps; and installation of soil conservation works.

An informative analysis was given of the different methods of bush-clearing employed in the Groundnut Scheme in Tanganyika, together with the costs of each operation. Much of the heavy equipment, particularly that used for the removal of roots, caused severe damage to the soil, and the current view is that lighter implements should be used wherever possible. Dr. Bunting concluded by saying that it is not generally appreciated how much detailed information on the bush-clearing techniques had been obtained in Tanganyika and that this information would be of great value in the planning and execution of clearing projects.

The second paper, entitled "The Present Role of Arboricides in Bush and Forest Clearance", was given by Mr. J. D. Fryer, of the Agricultural Research Council Unit of Experimental Agronomy, University of Oxford. The paper was in two parts. The first section reviewed the development of chemicals for killing individual trees or scrub either by individual treatment or by overall spray application. The second part summarized some work on arboricides carried out in Tanganyika and Kenya by members of the Unit of Experimental Agronomy working in conjunction with various organizations in East Africa.

Of the many chemicals that have been tested, arsenical compounds have proved to be by far the most successful, and they are at the present time widely employed in forestry and plantation work for the local treatment—in frill girdles, bark notches or auger holes—of unwanted trees. There is, however, a definite need for non-poisonous substitutes, and much work has been done during the past ten years in an attempt to find materials that are both efficient and safe. The most promising is undoubtedly ammonium sulphamate; but the synthetic growth regulators 2,4-dichlorophenoxyacetic acid (2,4-D) and 2,4,5-trichlorophenoxyacetic acid (2,4,5-T) have also given good results when applied in the same way as arsenical compounds, particularly with smaller trees. These phenoxyacetic acids also show promise when applied in an oil carrier to the bark of the trunk as a basal band of one or two feet. This treatment in effect 'girdles' the stem by killing the bast and cambium and may also destroy dormant buds, thus preventing or reducing regeneration.

During the past few years considerable advances have taken place in the destruction of bush or scrub by arboricides. Extensive areas of scrub along roadsides, under power and telegraph lines and in grassland are being sprayed each year in the United States and Canada with good results; this practice is being developed in other countries, particularly New Zealand. The chemical most commonly used for this work is 2,4,5-trichlorophenoxyacetic acid, generally as a long-chain ester, applied either alone or mixed with 2 : 4-dichlorophenoxyacetic acid. For overall applications from the ground, oil/water emulsions are often applied in a relatively high volume per unit area; but when application is made by aircraft more concentrated oil solutions or emulsions are employed. Ammonium sulphamate in an aqueous solution is also being widely used as an overall application from the ground.

The investigations in East Africa have been mainly of two types: the development of arboricides for the control of regenerating bush of the types found in tsetse-fly barrier clearings in Tanganyika, or for the destruction of *Isoberlinia-Brachystegia* bush in Nyasaland, which is characteristic of large areas where shifting cultivation is practised by the natives; and secondly, the testing and assessment of the value of chemicals as defoliants of woodland as an aid to tsetse-fly control. The results to date of spraying regenerating bush indicate that a complete kill is unlikely to be obtained with the existing arboricides because they are not transported in toxic quantities to the roots and because the species which are adapted to frequent cutting and firing sucker freely from the roots. The overall spraying by aircraft of the butyl ester of 2,4,5-trichlorophenoxyacetic acid on to an area of forest in Kenya resulted in defoliation and death of a great many woody species, including large *Ficus* trees and two succulent species of *Euphorbia*. The role of a defoliant in increasing the light intensity and thereby allowing the rapid growth of the grasses during the rainy season was of particular interest, since a normally unburnable vegetation was destroyed by fire during the following dry season. Further work on arboricides in East Africa is now being carried out in conjunction with the Unit of Experimental Agronomy at Oxford.

After a short discussion, the meeting was closed by Sir Harold Tempany, who said that there is no doubt that, if world food production is to keep pace with the increasing population, extensive clearing of land will have to be undertaken prior to agricultural development and that the techniques and principles of bush and forest clearing discussed during the meeting are likely to have a very real value.

SOUTH-EASTERN UNION OF SCIENTIFIC SOCIETIES

ANNUAL CONGRESS

At the invitation of the Maidstone Scientific and Antiquarian Society and the Mayor and Corporation of Maidstone, the South-Eastern Union of Scientific Societies held its fifty-ninth annual congress at Maidstone during June 10–13 under the presidency of Dr. Glyn Daniel. The local committee for the Congress was under the chairmanship of Sir Garrard Tyrwhitt-Drake, with L. R. A. Grove as local secretary. At the young naturalists' evening Maxwell Knight lectured on "The Hand Rearing of a Cuckoo", illustrating his remarks with lantern slides.

The presidential address to the Archæological Section, on "The Present State of Monastic Archæology in Kent", was given by F. C. Elliston Erwood, who dealt with the development of monastic buildings, using Kentish examples to illustrate his points. In mentioning the difference between usual monastic buildings and those of orders of military origin, he emphasized the scope for the examination of the latter within the county. G. E. Newell gave the presidential address to the Zoological Section, his subject being "Animal Zones of the North Kent Coast". He said that the physical environment, the exposure of animals for long periods by tidal action twice daily and large thermal differences demand a toughness in the faunal population. The direction of the beach drift is from east to west, opposite to that often suggested as existing in the Thames Estuary.

Dr. Glyn Daniel's presidential address to the Union was on "The Art of the Megalith Builders". He commenced by saying that although Stonehenge had been examined and studied for a great number of years, it had only recently been noticed that some of the stones had engravings, or decorations, upon them. He then spoke of the engravings on Megalithic stones in Anglesea (circles, lozenges and wavy designs), suggesting they may have been derived from Irish sources, and he compared them with similar patterns on examples in Brittany, Spain, Portugal and along the northern Mediterranean shore to its eastern limit, where engravings of an anthropomorphic character are well advanced. His address was illustrated by excellent lantern slides of subjects very difficult to photograph.

J. E. Lousley, as president of the Botanical Section, spoke on "The Amateur Botanist in 1954", saying that although botanical work now is so highly specialized that, besides expert knowledge, a modern laboratory is necessary, there still remains a great deal of work which can be successfully undertaken by the amateur. Mass observations on species and habitats are needed, and examples where amateurs can assist in collaboration with professional botanists are: a rose survey (charts would be provided and specialized knowledge is unnecessary); records of plant distribution within the vice-counties (plotting species upon maps using the 10-km. grid scale and marking with dots within the grid squares); noting the variation in numbers of a species in a known colony over a number of years; and the study of life-histories and of the method of conveyance of plants to new habitats, especially by the germination of seeds from bird droppings collected after careful observation. H. E. P. Spencer chose, for his presidential address to the Geological Section, the theme of "The Pleistocene Period and Work for the Amateur Geologist", and dealt with his recent work in East Anglia. He said that much remains to be investigated regarding the correlation of the fauna of the interglacial periods, and he suggested that amateurs could render considerable help by recording and collecting from temporary exposures. Norman Cook addressed the members on "Early English Antiquaries".

At the general assembly of the Union schemes for the development of its work were discussed and subjects for investigation outlined. Despite bad weather conditions, the full programme of excursions was carried out. The archæologists visited the Roman villa in course of excavation at Lullingstone, the Keep at Eynsford Castle now being excavated by the Ministry of Works, and Bodiam Castle. The botanists and zoologists went to Funton Creek, Queendown Warren, Bedgebury Pinetum and the Maidstone Zoo at Cobtree Manor. The geologists had an excursion to the Peninsula of Hoo to study the Tertiaries, the Chalk outcrop and the history and development of the North Kent marshes.

The sixtieth annual congress of the Union will be held next year in Folkestone during April.

BASIC SCIENTIFIC RESEARCH AND PUBLIC POLICY IN THE UNITED STATES

DESPITE the concern still being expressed in the United States regarding the adequacy of support for fundamental research, of which Dr. W. D. Coolidge's plea for more fundamental research effort (see *Science*, 119, 110; 1954) is a recent example, there is not the same sharp note of anxiety on this score in the third annual report of the National Science Foundation*. Removal by Congress of the 15 million dollar ceiling upon annual appropriations to the Foundation has permitted the Foundation to assume greater responsibility for the support of basic research; and the Board of the National Science Foundation has been encouraged by the sympathetic understanding of its problems by many members of Congress, although misunderstanding of science and its methods is still widespread. Wider public understanding of science, scientists and the implications of scientific development is of vital concern, in the view of the Board, not only to the Foundation itself, but also to the Federal and State Governments, academic institutions and industrial concerns.

The limits of expenditure on fundamental research are now set, the Board believes, not by financial resources but by the numbers of men and women with the capacity, interest and willingness to pursue science. They constitute a restricted section of the population, and science is not the only profession calling for high intelligence and disciplined ability. Accordingly, solutions to many current problems reside in the long-term functions of the National Science Foundation, and in his foreword to its annual report, Mr. Chester I. Barnard, chairman of the Board, makes it clear that the Foundation is increasingly concerning itself with these long-term functions.

Fundamental research has three relatively immediate consequences: the production of scientific workers; the production of new knowledge, much of which may prove useful in ways unforeseeable to-day; and the application of the results of research to the solution of practical problems. These consequences could encourage a tendency to utilize the Foundation for secondary purposes and administrative convenience, or else government interposition in science to an extent which, by attempting to dominate, might destroy it. Mr. Barnard insists that the Board is alive to these dangers and determined to operate so as to minimize them; and this contention is fully supported by the most important section of the director's report, namely, that dealing with science and public policy.

The detailed work of the Foundation during the year is described by Dr. A. T. Waterman. Studies carried out by the Foundation of the Federal Research and Development Budget on which he here comments have already been noted in *Nature* (172, 575; 1953). Dr. Waterman states specifically that it will be desirable to review periodically the relative support furnished to fundamental and applied science; but he points out that centralization of support of fundamental research in the Foundation will not be in the best interests of science unless, together with other research agencies, the Foundation can provide sufficient support for fundamental research to bring it in balance with the support given to applied research and development. Moreover, if operating agencies are to carry on fundamental research programmes directly related to their operating functions, they must be assured of a continuous direct flow of fundamental knowledge relating to their practical problems, and their staff should be in effective touch with other scientific workers.

Dr. Waterman's report indicates certain steps already taken by the Foundation towards the co-ordination of Federal research, and he refers to the appointment by the Foundation, in accordance with the recommendation of the President's Materials Policy Commission, of a committee to assist in formulating a broad programme of research and training directed towards strengthening the exploration and discovery of mineral resources; the development of measures to finance and execute such a programme; and the identification and study of background data and questions of policy which affect the conduct of research and training in this field. Of even wider interest, however, is the section of this report which deals with travel restrictions on foreign scientists, and this puts the question of contacts between scientific workers in its widest perspective.

---

* The Third Annual Report of the National Science Foundation. Year ending June 30, 1953. Pp. vii+110. (Washington, D.C.: Gov. Printing Office, 1953.) 40 cents.

Dr. Waterman then turns to the question of admission of foreign scientists to the United States. Since the restrictions were enlarged between 1948 and 1950, and afterwards embodied in the codified law which became effective in December 1952, it has been the practically unanimous opinion of scientific workers that relations between American scientists and their opposite numbers in countries friendly to the United States, particularly in the United Kingdom and other countries in Western Europe, have deteriorated. At least half of all foreign scientists who apply to enter the United States meet difficulties or serious delays. Refusals of permission to enter are much less frequent, and the chief damage to international relations arises from a few instances of refusals to outstanding persons, and from the tediousness and uncertainty of the procedure even for those who are admitted.

In testifying in October 1952, before the President's Commission on Immigration and Naturalization, concerning the impact of existing immigration laws on science, Dr. Waterman pointed out that creative scientific ability is not circumscribed by national boundaries. He referred to America's dependence on findings and accomplishments in pure science abroad in achieving her own advanced technology and standards of living. Excluding students, about three thousand foreign scientists are estimated as having visited the United States in 1951, and Dr. Waterman said that their importance to the scientific strength of the United States was out of all proportion to their number, as, generally speaking, they represented the best scientific minds of the free world outside the United States.

In closing his comment, Dr. Waterman made four specific recommendations which would, he believed, achieve a better balance between security by isolation and security by technological achievement. First, he suggested a distinction between procedures and criteria for temporary admission, particularly a visit of a few weeks or months, and those for permanent residence. For the former, he suggested that the criterion for exclusion might rationally be based on present sympathetic association with a foreign subversive organization, rather than, as now, affiliation in an extremely broad sense of the word at any time in the past with such an organization. Third, he suggested that provision should be made for selective audit from time to time of applications for temporary admission by a competent, reliable and disinterested group with appropriate experience both inside and outside government. This suggestion is prompted by the wealth of experience accumulated with security programmes in which a balance must be struck between isolation and technological achievement.

Lastly, if these suggestions prove impracticable, Dr. Waterman recommends the establishment of a separate section of the immigration law, creating a simplified and expeditious system for admitting students, trainees, teachers, guest research workers, professors and leaders in fields of specialized knowledge and skill who have applied for admission for a purpose directly related to the activities of a government agency, an accredited institution of higher learning or a scheduled meeting of an accredited international professional organization.

It is not known what reception these proposals met; but if in due course even the fourth only is adopted, some of the friction at present experienced should be removed and a real contribution made to the exchange of thought, of experience and of knowledge upon which the advance of science and technology alike depend. As Dr. H. W. Dodds, president of Princeton University, remarked in a recent comment in the *Universities Quarterly* on the Seventh Congress of the Universities of the Commonwealth last July, one welcome result of the presence of its American guests was to remove some misunderstandings outside the United States as to the extent to which current Congressional practices have endangered freedom of scholarship and of communication. None the less, it would be ungenerous not to welcome the firmness of Dr. Waterman's evidence in favour of scientific and technological mobility and communication or to fail to note that the leadership of the National Science Foundation is in the hands of those who understand so clearly the fundamental conditions of the advancement of science and technology and who are not afraid to add their testimony to that of other leaders in science, scholarship, teaching or industry, whether in the United States or elsewhere in the free world.

PLANT GENERA

THE Chronica Botanica Co. has once again placed botanists in its debt by bringing together the papers of a symposium (Cornell, 1952) of the American Society of Plant Taxonomists and the Botanical Society of America under the title of "Plant Genera, Their Nature and Definition" (*Chronica Botanica*, **14**, 3, 89–160; 1953; 2 dollars; Chronica Botanica Co., Waltham, Mass.; Wm. Dawson and Sons, London, W.C.1). The book contains a foreword by Dr. Frans Verdoorn, an introductory essay by Dr. Th. Just on "Generic Synopses and Modern Taxonomy" and the following symposium contributions: "Plant Genera, their Nature and Definition: the Need for an Expanded Outlook", by Dr. G. H. M. Lawrence; "The Anatomical Approach to the Study of Genera", by Dr. I. W. Bailey; "Floral Anatomy as an Aid in Generic Limitation", by Dr. A. J. Eames; "Cytogenetical Approaches to the Study of Genera", by Dr. R. C. Collins; "Cytology and Embryology in the Delimitation of Genera", by Dr. M. S. Cave; and "Plant Geography in the Delimitation of Genera: the Role of Plant Geography in Taxonomy", by Dr. H. L. Mason. Interleaved with these essays are facsimiles from early generic Floras.

As the above titles indicate, the nature of the botanical genus in its many aspects and relationships is very fully reviewed and discussed; and while the delimitation of genera in all classes of plants by hard-and-fast rules has not yet been found possible, there is general agreement that the genus is probably the most natural, comprehensive, useful, important and effective taxonomic unit applicable to all groups. It is probably also the unit—the genus being most simply defined as a group of related species—of greatest use to the non-taxonomic botanist.

In his discussion of the difficulties of generic delimitation, Dr. Lawrence considers that taxonomists must function as synthesizers, and bring to bear on each problem all relevant data from related fields of botanical study. He also suggests a number of practical steps which may be taken to achieve this desirable end. Dr. Bailey considers that it is essential to determine what contributions anatomy can actually make to taxonomy, since some characters that appear to be relatively stable in some groups may be highly plastic in others; that is, internal characters are inherently no more reliable than external ones. One of his conclusions is that, because the anatomical approach is so time-consuming, it should in the main be reserved for those specially difficult problems where the significance of the results is likely to justify the effort expended. The anatomical approach to taxonomy has been especially rewarding in certain groups, in particular in certain ancient and primitive woody dicotyledons. Dr. Eames points out that, in taxonomic and phylogenetic studies, the internal structures of the flower are just as valuable as, and, in some instances, for example, where parts are vestigial, may be even more valuable than, the external form. But the evaluation of internal floral structures, as evidence of natural relationships, requires a wide knowledge of this field of observation and an awareness of the prevalence of evolutionary parallelisms and convergences. At the generic level, groups of floral anatomical characters, and even some rather specific ones, may be surprisingly well defined. Dr. Eames gives many interesting examples of the application of floral anatomy to problems of taxonomy; in the Ranunculaceae, for example, which has long been regarded as a "very natural family", the anatomical evidence yields a quite contrary view, and indicates that some of the included genera should be raised to family status. This illustrates the critical importance of the combined taxonomic and anatomical approach.

In a critical discussion of the cytogenetical contribution to the delimitation of genera, Dr. R. C. Rollins makes the point that, in determining the nature and limits of a particular genus, it is not a question that the investigation must be done at the generic level or not at all: rather, the interest should centre on the relatedness of the species involved; and it is here especially that cytogenetics can make an important and, in some instances, essential contribution. Examples are cited where the genetical evidence has pointed the way to the correct generic placing of previously intractable species; but because of the time involved, genetical studies can only be directed towards especially favourable groups.

The value of a knowledge of chromosome numbers in taxonomy is critically considered and the use and limitations of the data assessed. Chromosome number affords valuable evidence for taxonomic purposes in some instances but not in others. Where the chromosome number is constant within a genus, a useful test is available for the inclusion or exclusion of a species where doubt as to its affinity exists; on the other hand, if both aneuploidy and polyploidy occur within a genus, the cytological evidence may not be of much assistance in delimiting the genus, although it may be useful as an indication of relationships between the species. It is held that chromosome morphology, critically ascertained, may perhaps offer greater possibilities in generic definitions than chromosome numbers; but where the chromosomes are of very small size, or present in large numbers, this approach tends to be beset with difficulties. The general conclusions reached are that chromosome study provides, for taxonomic purposes, essentially the same kind of evidence as that derived from other parts of the plant, and that cytogenetics may aid substantially in the construction of the kind of generic classification that most adequately reflects the evolutionary relationships of the component species and of the families to which they belong. The respective contributions of embryological and plant geographical studies to an understanding of genera are also adequately discussed. The general effect of this collection of papers is to bring before the reader a fund of valuable and interesting information on many aspects of botany as they relate to a central and traditional theme.

STUDIES IN SOCIAL ANTHROPOLOGY

SIR JAMES FRAZER, a classical scholar and a type of prehistorian more than he was a historian, was interested in what he termed "the general laws which have regulated human history in the past, and which if nature is uniform may be expected to regulate it in the future". The lecture by Prof. Max Gluckman on "Rituals of Rebellion in South-East Africa"* is the Frazer Lecture for 1952, and that by Prof. M. Fortes†, which is his inaugural lecture as William Wyse professor of social anthropology in the University of Cambridge, is in agreement with Frazer, Haddon, Malinowski and Radcliffe-Brown that there are regularities independent of period and place in social organization and culture, defined as morals, law, custom and socially acquired capabilities and habits. Therefore, it is appropriate to consider here Frazer on the topic of uniformities about man's natural status.

Frazer was distinctly uncritical in his acceptance of what missionaries wrote about primitive culture and personality. For example, of the Kai Papuans of the 1899–1902 and earlier period, Charles Keysser remarked that they were fearful of the military power of an enemy, and parsimonious about making payments to allies whom they needed to mount successful offensives, preferably with superior force, against some neighbouring small group of Kai they termed sorcerers. On account of these traits of character, the leaders of the small territorial groups into which the natives were divided before their conquest sometimes delayed launching attacks against sorcerers for some interval of time after their fellows' deaths which they regarded as provocations. They attributed droughts, inroads of garden pests, bad luck in hunting and epidemics of colds in the head, which sometimes supervened in time of delay and of unreadiness for mounting attacks against sorcerers, to the wrath of the spirits of their kindred, which they worshipped in a manes cult, but whose deaths—to discuss dead men as if they were spirits—had not provoked prompt retaliatory (that is, offensive) attacks against sorcerers.

---

* Rituals of Rebellion in South-East Africa. (The Frazer Lecture, 1952.) By Prof. Max Gluckman. Pp. ii+36. (Manchester University Press, 1954.) 3s. 6d.

† Social Anthropology at Cambridge since 1900: an Inaugural Lecture. By Prof. M. Fortes. Pp. 47. (Cambridge University Press, 1953.) 2s. 6d.

The Kai thought that the greatest love and the deepest sympathy which they could display to their dead was to retaliate for their dead against sorcerers, and so help their spirits to attain rest and peace in the other world, which in their belief was an underworld to which the spirits went about the time the flesh decayed on the skeleton. If the Kai had not feared the ghosts of their fellows more than they feared the military power of an enemy, and more than they valued their savings of shell ornaments, boars' tusks and pork, which they expended to procure allies, they would not have launched their offensives against sorcerers, but would have remained peaceful. The Kai of the 1902–11 period under German administration up to the date of Keysser's publication in "Deutsch Neu Guinea" (edited by R. Neuhauss) were peace-loving by nature, and in this respect considered to be comparable to Germans.

Keysser's views on the topic of Papuan tribal culture and personality require critical analysis. Sir James Frazer, however, searching for general laws of prehistories, uniformities of human nature and expected regularities of histories, accepted Keysser without question, attributed homicides in connexion with sorcery once held justifiable by Australian aboriginals, some Melanesians and some Papuans to ghost fear, and compared primitive warring about pretexts proper to a general belief in magic with European wars over religious differences. In his work "The Belief in Immortality" (Vol. 1) he summed up this view of uniformity in human nature, and of general laws which have prevailed in human history, with the remark: "The state of war, which normally exists between many, if not most, neighbouring tribes, springs in large measure directly from their belief in immortality; since one of the commonest motives for hostility is a desire to appease the angry ghosts of friends, who are supposed to have perished by the baleful arts of sorcerers in another tribe, and who, if vengeance is not inflicted on their real or imaginary murderers, will wreak their fury on their undutiful fellow tribesmen. Thus the belief in immortality has not merely coloured the outlook of the individual upon the world; it has also deeply affected the social and political relations of humanity in all ages; for the religious wars and persecutions, which distracted and devastated Europe for centuries, were only the civilized equivalents of the battles and murders which the fear of ghosts has instigated amongst almost all races of savages of whom we possess a record".

The remark is an instance of error in an attempted explanation of miscellaneous facts in a formula about motives and character. Another instance of the kind is the thesis of "The Golden Bough", which discusses in odd places the homicides of divine kings by their successors, with no good reduction of miscellaneous facts to a formula including the affair of Cromwell and Charles I, or the homicide of a Hapsburg in Serbia in 1914. Ruth Benedict and Margaret Mead have also written anthropological works in the culture and personality field; but, as Bernard Notcutt notes in his recent work entitled "The Psychology of Personality", what the subject needs at the moment is some kind of discipline. Papuan culture, although it varied somewhat in different areas of New Guinea, probably did not vary in an entirely disorderly manner; and partly with an intention of testing Margaret Mead's theories about Papuan character, we studied a bow-and-arrow fighting over sorcery among the Kamano Papuans in 1935. The Kamano said upon question in 1951–52 about motive that they had not thought that the spirits of their dead needed their former actions against sorcerers of them; they had not maintained a doctrine that ghosts required the deaths of sorcerers; and they had not feared ghostly commination for delay in launching offensives, although they had not delayed. The provoking natural deaths which had preceded the fighting incidents we had seen in 1935 had taken place one, five days before an incident broke out, and one nine days before another. We investigated antecedents and sequences in detail; but there is no space to discuss them here.

Nature, when known, is a critic of such gross imputations of responsibility for the purpose of punishment or of dispute of land tenure as may be implied by the belief in sorcery as the cause of death, and one may be interested in the truth or error of statements claiming to state uniformities about man's natural status without expectation that men will return to prehistoric conditions. Prof. Fortes's inaugural lecture takes issue with a view expounded by Evans-Pritchard in his "Social Anthropology" that 'social systems' are not 'natural systems' and that therefore social anthropology and sociology need not have as their aim statements of uniformities about man's natural status. Prof. Gluckman discusses first-fruit rituals of the agricultural year among the Zulu and the Swazi. The thesis is that ritual expresses the tensions of the social organization. A similar thesis is maintained by Evans-Pritchard in his Frazer Lecture for 1948, "The Divine Kingship of the Shilluk" of the Nilotic Sudan, with a note that there was no knowledge that actual regicide had occurred often in their unwritten past.

R. F. Fortune

THE HANFSTAENGL COLOUR COLLOTYPE REPRODUCTIONS

THE colour reproductions of old and modern masters, printed and published by the firm of Hanfstaengl of Munich, which since the beginning of the War were unobtainable in many countries, are happily once more available. The firm of Hanfstaengl is well known for the high quality and fidelity of its reproductions; moreover, it has covered a very wide range of original paintings and schools—from the classics to the impressionists and expressionists.

The Pallas Gallery, Ltd., 28B, Albemarle Street, London, W.1, are sole agents in Great Britain and the British Commonwealth for Messrs. Hanfstaengl, and has recently issued a well-illustrated catalogue of the 150-odd prints now available. The prices are 42*s*., 52*s*. 6*d*., 63*s*., and 73*s*. 6*d*.; and some four-colour prints (20 in. by 16 in.) may be obtained at 21*s*. each.

Among the various artists represented are (with examples given in brackets): Italian School (Titian, Botticelli); German School (Dürer, Holbein); Flemish and Dutch Schools (van Dyck, Rubens); French Impressionists (Renoir, Monet); Post-Impressionists (Cézanne, Gauguin, van Gogh); School of Paris (Matisse, Picasso); Kokoschka; German Expressionists (Marc); German Romantics (von Hess); and a collection of decorative pictures including landscapes (Heffner, Mercker), animal paintings (Olszewski, Roloff) and flower pieces and genre pictures (Berndt).

The sample reproduction submitted for review is "Horses in a Storm" by A. Roloff (24 in. by 29½ in., 52*s.* 6*d.*). This print admirably conveys the feeling and tonal qualities of the original, for the impasto, though evident, is not intrusive. From the purely technical point of view, closer register in the printing would have added to the excellence of this reproduction; but this does not detract from the fact that it is a splendid piece of printing. Moreover, the reproduction itself conveys the gripping vitality of the original; yet withal it is unusual among horse paintings in that the artist strikes the reviewer as having, with consummate cunning, transferred action and virility from the animals to the elements around them. So excellent is this reproduction of a superb painting that anyone would surely be proud to possess it.

Men of science, whether academically interested in art or practically concerned with *décor*, would do well to examine this catalogue (a piece of good printer's art in itself). Geographers and natural historians might show more specific interest and appreciation; but all will be grateful to the Pallas Gallery, Ltd., for making these prints again available, and at such comparatively modest prices.

L. J. F. Brimble

AMERICAN PHILOSOPHICAL SOCIETY

YEAR BOOK FOR 1953

The "Year Book 1953" of the American Philosophical Society* covers the year ended December 31, 1953, and includes the customary brief history of the Society, and a copy of its charter and laws, together with lists of officers and committees and members, biographical memoirs and the reports of standing committees. The report of the Committee on the Library refers to satisfactory progress in implementing the Darwin programme and says that the search for secondary material pertaining to the evolution theory is meeting with much success; nearly five hundred volumes have been added, and more letters to and from Darwin and his associates have been acquired. The collection promises to become one of the foremost on the subject in the world.

More than a third of the volume is occupied by the report of the Committee on Research, which details 151 grants, totalling 135,661 dollars, from the Penrose Fund, eight, totalling 15,750 dollars, from the Johnson Fund, and eight, totalling 15,255 dollars, from the Daland Fund for Research in Clinical Medicine. Five grants, totalling 15,700 dollars, were also made during the year from the Michaux Fund. This part of the report consists mainly of brief reports from recipients of grants, arranged alphabetically by sciences. Among the more detailed of these summaries may be mentioned those of the following: O. Struve, on measurements of the spectrum of Capella, which point to 0·9 for the mass ratio of the cool component to the hot component; H. L. van Dyke, on the formation of alkylbenzenes through the Friedel–Crafts, Fittig and Grignard reactions; H. S. Colton, on Lower Pliocene mammalian fauna from near Walnut Grove, Yavapai County, Arizona; R. Chambers, on studies of the permeability of the egg of *Fundulus* (sea minnow) to water and electrolytes, which suggest that the constant plateau level of the pressure observed when the eggs, activated by puncture, were freshly shed into sea water, is due largely, if not entirely, to the ability of the perivitelline colloid to hold water, and possibly electrolytes, irrespective of the tonicity of the surrounding media; S. S. Roback, on the tendipedid larvæ of the Philadelphia area; R. I. Sailer, on the significance of hybridization among stink bugs of the genus *Euschistus*; and T. A. Stephenson on plant and animal ecology of the sea-shore between tide-marks in the Bermuda islands in which a flourishing colony of the unusual barnacle *Catophragmus imbricatus* was discovered, and evidence obtained that the progressive smoothing-off of the æolian limestone around Bermuda between the high-water and low-water level is due to a considerable extent to the browsing activities of beaked fishes and of various invertebrates. F. W. Crane, studying the diagnostic characters of fern spores, particularly of *Dryopteris*, reports that the species of *Dryopteris* observed can be separated on the basis of spore characters, that the hybrids are easily recognized as such by their peculiar spore production and that hybrid spores are not in themselves completely diagnostic; the morphology of the specimen must be considered. J. Merkle reports on an ecological analysis of the meadows on the Kaibab Plateau, Arizona; F. D. Reed on progress with a monograph on the Calamites; D. J. Rogers on variations in *Manihot utilissima* and related species in Jamaica and Costa Rica; and W. A. Weber on variation in *Balsamorhiza* (Compositae).

R. A. Waterman describes an ethnological and ethnomusicological field investigation of the aboriginals of Yirkala, North-Eastern Arnhem Land, Australia; N. C. Li reports on his investigations on the stability of zinc complexes with glutathione and oxidized glutathione and of copper II complexes with oxidized glutathione; D. W. Wilson on investigations of the biochemistry of nucleic acids with the Beckman ultra-violet spectrophotometer and the International refrigerated centrifuge; and L. W. Bluemle on the application of extra-corporeal hæmodialysis to remove œdema fluid, re-evaluate the toxic factors in uræmia and in studying the effect of dialysis upon the production of urea, in which the value and versatility of the artificial kidney in treating and investigating problems of fluid and electrolyte metabolism have been demonstrated.

Among reports on research work grouped under the humanities which are of scientific interest may be noted those of E. G. Allen on John Abbot, the ornithologist of Georgia, which should facilitate the writing of his biography as well as an account of his pioneer work in natural history in America; G. E. Fay on the archæological cultures of the southern half of Sonora, Mexico; A. J. B. Wace on excavations at Mycenæ, Greece; S. S. Weinberg on the comparative archæology of the Ægean and the Near East in the Neolithic period; W. D. Wallis on the ethnography of the Maliseet (Malicete) and of the Micmac Indians of New Brunswick, Canada; and G. M. A. Hanfmann on the development of geometric and orientalizing art in Ionia with special reference to vase-painting and minor arts.

MEASUREMENT OF EYE MOVEMENTS ACCOMPANYING VOLUNTARY HEAD MOVEMENTS

By F. HODGSON and DR MARY P. LORD

Department of Physics, Chelsea Polytechnic, Manresa Road, London, S.W.3

AMONG the many methods of eye-movement measurement which have been described, that using the corneal–retinal potential difference is notable for causing minimum interference with the subject. The method has been fully described elsewhere[1]; but a brief résumé will be given here.

A steady potential difference exists between the back and front of the eye, the latter being more positive; the magnitude of the potential difference is of the order of 1–2 mV. As a consequence of this, when the eye moves to left or right, a change occurs in the potential difference between points on the skin on either side of the eye; a similar change occurs between points above and below the eye when the eye moves up or down. These potential changes can be detected by pairs of electrodes attached to appropriate points on the skin. When amplified and recorded, the changes may be used to deduce the horizontal and vertical deflexions of the eye, since they may be shown to be directly proportional to the angular displacement of the eye. For the measurement of horizontal eye movements, the electrodes may be placed, either one on each temple, giving the movements of both eyes, or one on the temple and the other on the nasal bone on the same side, giving the movements of one eye only.

The corneal–retinal potential method has the further advantage that, if flexible leads are used for connecting the electrodes to the amplifier, the head is quite free to move, and therefore eye movements occurring during head movements may be investigated.

In the present experiments, movements of the eyes and head about vertical axes have been recorded simultaneously. The electrodes used were concave copper disks 1 cm. in diameter, placed one on each temple and held in position by adhesive tape. A third electrode of 2 cm. diameter was fastened behind one ear and connected to earth. Light screened leads connected the electrodes to a high-gain symmetrical d.c. amplifier, the output of which operated a push–pull cathode-follower output-stage*, driving one pen of a multichannel recorder unit. The sensitivity of the method was limited by the noise-level of the 50-c./s. pick-up from the subject, which was usually equivalent to ½–1° of eye movement. To keep the 50-c./s. hum at this low level, it was necessary to lower the skin resistance of the subject to not more than 2,500 ohms. This was effected by using saline jelly, contained in the hollow of the electrode for the actual skin contact, and by thoroughly cleaning the skin with electrode jelly and cotton wool. To eliminate noise caused by the leads pulling the electrodes when the head moved, each lead was attached to the skin with adhesive tape, about 1½ in. from its electrode.

Preliminary photographic work had shown that the head can, when free, rotate about a single near vertical axis; the inclination of this axis to the vertical depended on the sitting posture of the subject. Head movements about this axis were recorded simultaneously with the eye movements by another pen of the multichannel recorder. Each subject wore a plaster cap (Fig. 1) in the top of which was embedded a 5/16-in. spindle, placed so as to coincide with the axis of rotation of the head. To ensure that the spindle rotations followed those of the head completely, a dental wax impression was made for each subject, and rigidly connected to the plaster cap by a brass rod and strips, as shown. The spindle was connected by a flexible bellows-type coupling to the spindle of a linear potentiometer. The potentiometer was held in a cradle above the head of the subject, who was seated in a specially constructed chair; provision was made for the potentiometer axis of rotation to be tilted slightly from the vertical, if necessary. A potential difference of 360 V. was applied to the terminals of the potentiometer, and the output from the slider was applied to the grid of an output valve, which operated a second pen of the recorder.

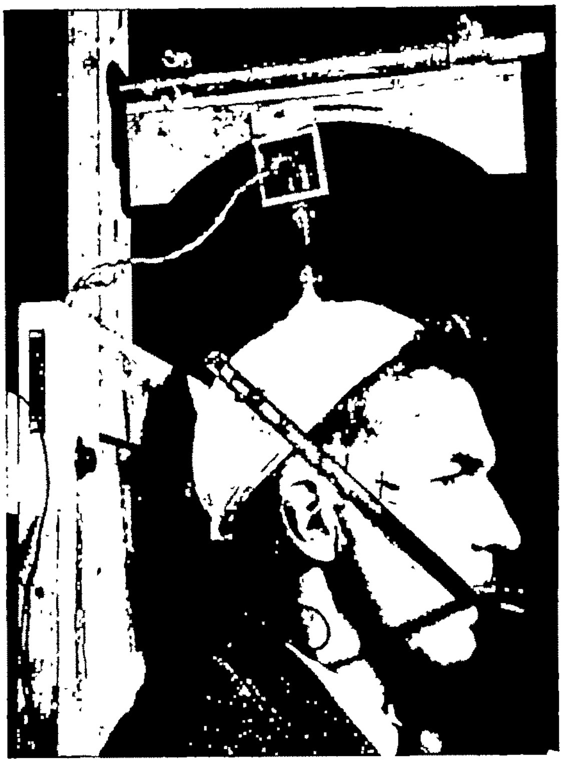

Fig. 1. Head-movement apparatus and electrode positions

A third pen of the recorder produced time markings at the rate of 10 per second, being connected to a multivibrator, synchronized by the 50 c./s. mains.

The apparatus has been used for investigating eye movements associated with two types of side-to-side head movements: those performed in the subject's own time without significant pause at the extreme positions; and those performed at the operator's request with pauses of a second or so at the extreme positions. In both cases, three speeds of movement were attempted—fast, medium and slow. Movements of the eyes with no attention paid to the eyes have been recorded for both types of head movement. For the first type only, eye-movement records have been obtained when the subject tries to maintain his eyes in the central position relative to the head. In all cases, records have been obtained for eyes both open and closed.

A detailed account of the results obtained will be published elsewhere. It would appear that the eye-movement pattern is largely determined by impulses arising from the head-movement stimulus rather than by the subject's will, since almost all eye-movement records show a similar saccadic pattern; the magnitude and frequency of the saccades depended on the speed of head movement. However, the saccade-rate was greater when the subject attempted to keep his eyes in the central position in the head than when no attention was paid to the eyes; moreover, further investigation showed that the subject can maintain fixation on a stationary object while moving the head. The records also show that the head movements from a position of prolonged rest were retarded relative to the eye movements; this may be due to the greater inertia of the head compared with that of the eye—from an instantaneous position of rest, the head moved before the eye. The effect of closing the eyes seems to be merely one of damping.

We wish to thank the subjects, Messrs. I. M. Gibson, B. Mofflitt and E. J. Spain, with all of whom we have had stimulating discussions, and Mr. G. Mallet for assistance with the construction of the apparatus. The continued financial support of the Medical Research Council is gratefully acknowledged.

ELECTRON DIFFRACTION DIAGRAMS OF CELLULOSE MICROFIBRILS IN *VALONIA*

By PROF. R. D. PRESTON, F.R.S., and G. W. RIPLEY

Biophysics Subdepartment, Botany Department,
University of Leeds

ELECTRONMICROGRAPHS of native cellulose (cellulose I) invariably reveal the presence of long narrow threads, termed microfibrils, whatever the source of the cellulose may be. In view of the known structure of cellulose, derived in the main from X-ray diffraction studies of comparatively very much larger specimens, it is equally invariably implied that these microfibrils are composed of molecular chains of cellulose lying more or less parallel to each other. It has indeed been claimed, using arguments based on the breakdown of cellulose in sulphuric acid, that the microfibrils are built from sub-units resembling 'micelles' and should therefore be referred to as 'micelle strings'[1]. Direct evidence has so far, however, been lacking.

In the course of a reinvestigation of the structure of the walls of *Valonia*, we have found it possible so to modify our Philips electron microscope as easily to record electron diffraction patterns. These to a large extent provide the direct evidence as to the structure of microfibrils. Since, in addition, they have a distinct bearing upon the statements which have recently been made concerning the wall structure of *Valonia*[2], they are presented at this time as being relevant both to the general problem of cellulose structure and to the special one of *Valonia* cellulose.

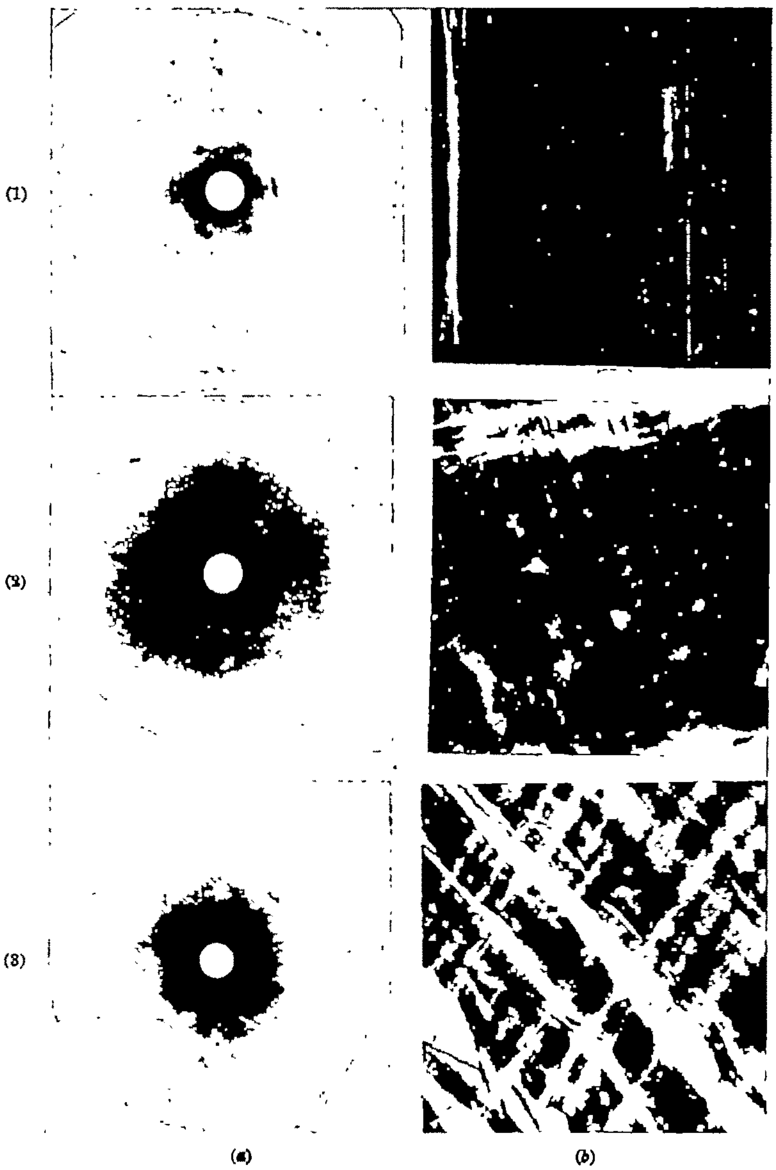
Material has been examined of *V. macrophysa* collected at Naples and of *V. ventricosa*, the specimens being prepared, as elsewhere described[3], as free from distortion as possible. The electrical circuits of the microscope have been so modified as to enable a considerable reduction in beam intensity and a reduction in the accelerating voltage across the electron gun to 25 kV. Under these conditions, electron diffraction diagrams which otherwise flash up and disappear in less than a second remain visible and essentially unchanged for many minutes. Three representative diagrams are presented in Figs. 1*a*–3*a* and the corresponding electronmicrographs in Figs. 1*b*–3*b*. The specimens were mounted without a supporting film and were, of course, unshadowed. Contrast is therefore lacking in the electronmicrographs, but the general run of the microfibril directions can nevertheless be seen.

In Fig. 1, the prominent equatorial arcs, beginning at the outside of the diagram, can be unequivocally referred to planes of spacing 3·9 A., 5·4 A. and a very weak arc at 6·1 A., which will be discussed later. Comparison with Fig. 1, *b* shows that the microfibril direction lies at right angles to this equatorial row of arcs, as would be expected if the molecular chains of cellulose lay along the length of the microfibrils. Equally, in Figs. 2 and 3, the two sets of microfibrils each lie at right angles to the corresponding row of arcs. This constitutes, therefore, direct evidence concerning the orientation of the cellulose chains within the microfibrils. The radial broadening of the arcs is, however, just as impossible of unique explanation as it is in X-ray diagrams from bulkier specimens.

Turning now to the special problem of the organization of the cellulose in *Valonia*, one or two relevant and important points may be made. The arc corresponding to planes of 6·1 A. spacing is recorded only when the specimen has torn and one edge has rolled up. In specimens which appear to be completely flat (for example, Fig. 2) this arc is missing. In this thoroughly desiccated material, therefore, the planes of spacing 6·1 A. tend to lie parallel to wall surface, just as they were shown to do in air-dried material by the X-ray method[4]. It should further be recalled that a similar uniplanar orientation has been demonstrated in wet, living specimens of *Rhizoclonium*[5], a filamentous alga the wall structure of which resembles that of *Valonia* very closely. This orientation is therefore maintained over the whole range of water content. In quoting the opinion of Preston and Astbury, stated some sixteen years ago[4], that this orientation then observed in air-dried material might have been induced by dehydration, Steward and Muhlethaler[2b] have evidently failed to appreciate the more recent observations on fresh specimens[5].

The microfibrils do not therefore roll over markedly even under the intense desiccation in the electron microscope. It is consequently impossible to conceive that desiccation could effect a mass reorientation of the microfibrils such as Steward and Muhlethaler[2] seem to consider in comparing their three-layer repeat structure with the original two-layer repeat proposed by Preston and Astbury[4]. Whatever may be the cause of the discrepancy between the findings of Preston and Astbury[4] and Steward and Muhlethaler[2], it is quite incredible, on this as well as other grounds, that a change in orientation induced by desiccation can have any part to play.

The diagrams presented here are significant in still another way. The original findings of Preston and



Figs. 1–3. (a) Electron diffraction diagrams; (b) electronmicrographs of identically the same specimen, using lamellæ stripped from *Valonia macrophysa*. (a) and (b) are arranged in mutually correct orientation

Fig. 1. A single lamella. Note the single set of prominent equatorial arcs. Fig. 1, b, magnification 5,600. Note that the edge of the specimen to the left has rolled up. This has caused a weak 6·1-A. arc to develop in Fig. 1, a

Fig. 2. Two lamellæ, inter-microfibrillar angle about 60°. Fig. 2, b, magnification 6,000. Note the absence of an arc at 6·1 A. in Fig. 2, a

Fig. 3. Two lamellæ inter-microfibrillar angle about 80°

Astbury[4], based on some 15,000 X-ray diagrams from many adult vesicles, were that the wall consists of two sets of lamellæ, the cellulose chains crossing at an angle which was variable from place to place in one vesicle, and from vesicle to vesicle, between about 60° and about 90°. Steward and Muhlethaler[6], from what must be far fewer observations and certainly based on a very much smaller bulk of material, claim that the wall is three-layered with an angle of 60° between the three sets of cellulose microfibrils. We have taken up to the present at least two dozen electron diffraction diagrams and these lend full support to the findings of Preston and Astbury[4]. None of them reveals the presence of more than two sets of arcs even when three sets of microfibrils are visible in the electronmicrograph of identically the same specimen. We do not propose at the moment to lay any stress on the absence of diffraction from one set of microfibrils since it is difficult to be sure that all three sets are present in equal amounts; but rather to emphasize that the commonest type of observation is that recorded in Fig. 3. If, in such cases, there could be lamellæ with a third orientation stripped away during specimen preparation, then the mutual angle between the microfibrils could not be anywhere near 60°. On the whole, the evidence at present available in mature vesicles leads firmly to a basic structure of two sets of microfibrils at an angle less than 90° to each other, with an occasional third set interspersed. Only in the special circumstance that the angle between the two basic sets is 60° can there then be, even sporadically, three sets at 60°.

It is not proposed to comment further on the special case of *Valonia* until further work in progress is completed. Two general facts may, however, be quoted which have not hitherto been mentioned in the discussions on *Valonia*. First, it is now quite clear that some, perhaps many, algal walls reveal the presence of microfibrils in the electron microscope but yield only very diffuse X-ray diagrams. Not all microfibrils visible, therefore, are crystalline or, indeed, cellulosic[7]. Secondly, some algæ other than *Valonia*, notably the Cladophorales (except the *Spongomorpha* group), show the same type of wall structure as *Valonia*[8]; and here only two sets of microfibrils have been reported, and both the interchain angles (derived from X-ray diagrams) and the intermicrofibrillar angle (observed in the electron microscope) are commonly about 90°. The condition in *Valonia* should therefore not be dealt with solely as a special case but should be interpreted in terms of this very wide background we now have of algal wall structure generally.

Synthesis of Branched Polymers

Little is known about the behaviour of branched-chain polymer molecules either in solution or in the solid state. One of the difficulties hindering the acquisition of this knowledge is the lack of synthetic methods for building molecules to a predetermined pattern. This communication is concerned with one approach to a solution of this problem in the case of vinyl polymers. Polystyrene may be taken to illustrate the application of the method.

Polystyrene in solution in carbon tetrachloride is brominated photochemically at room temperature until the bromine content rises to about 5–10 per cent. The brominated polymer is dissolved in styrene monomer and the solution irradiated with ultraviolet light of such a wave-length that the bromine atoms are removed, leaving polymer radicals and free bromine atoms both of which initiate polymerization, branches growing from the polymer radicals. Unless the bromine content of the initiating polymer is very low the product is precipitated as a gel, showing that cross-linking has occurred by the radical branches combining[1]. However, cross-linking may be prevented by the addition of carbon tetrachloride, which then acts as a transfer agent and gives rise to shorter branches. By a judicious choice of conditions it is possible to obtain a mixture of branched-chain polystyrene and linear polystyrene so different in molecular weight that the two components may be separated by fractional precipitation. From the fractionation results, it is possible to estimate the weight fraction of high polymer molecules present as branches. The use of styrene monomer labelled with carbon-14 for the branch-growth polymerization makes possible an alternative determination of this quantity.

The determination of the number of branches per molecule is more difficult. From the observed rate of polymerization it is possible, with a knowledge of the velocity constants of propagation and termination and of the transfer velocity constant of the styrene radical for carbon tetrachloride, to calculate the average length of the branches.

Unfortunately, transfer constants are not known with a very high degree of precision. Determination of the average length of the branches and the weight fraction of the branches enables a simple calculation of the frequency of the branches. A second method is available for determining the frequency of the branches. The branched polystyrene will have a smaller bromine content than the starting material partly because of the dilution effect of the added branches and partly because each branch replaces a bromine atom. The bromine contents of a brominated polymer before and after branching were determined by the neutron activation technique and provided data for the calculation of the number of monomer units in the backbone of the polymer per branch. The results of a number of branching experiments are summarized in the accompanying table.

Expt. No.	% branching	Chain-length of branches (P_n)	No. of monomer units of backbone/branch	M_w of backbone	Branches per molecule
$A1$	37	130	220	300,000	14
$E3$	39	310	480	900,000	19
$E4$	25	95	290	900,000	31
$F1$	34	230	450	200,000	4·6
$F2$	37	210	390	200,000	5

The branching figures given in the table have been calculated from the fractionation data. The molecular weights of the backbones of the polymers have been estimated from viscosity measurements on the brominated linear polystyrene.

In the case of experiment $F1$, radioactive monomer was used. This tracer technique indicated that the product was 35 per cent branched, or one branch per 430 monomer units of backbone. Bromine analyses on the branched polymer $F1$ indicated one branch per 350 monomer units of backbone or 40 per cent branched.

Experiments with radioactive monomer and the determination of bromine by neutron irradiation were carried out in collaboration with Dr. J. C. Bevington, whose advice and assistance are gratefully acknowledged. The work is being extended to other vinyl polymers.

Chemical Action of Ionizing Radiations: Excitation of Optical Levels by Particles of Relatively Low Energy

It is well known that the energy lost by the fast particles of ionizing radiations is ultimately used for the excitation of discrete states, for ionization and for giving to the secondary electrons kinetic energies less than the first excitation-level of the atoms or molecules present in the system[1].

When the kinetic energy of the charged particles is large compared with the ionization and excitation potentials of the atoms or molecules present, excitation (and ionization) will be distributed among all the atoms and molecules in the system according to their relative proportions. However, as the particles are slowed down, they are no longer able to excite those species the excitation potentials of which are greater than the kinetic energy of the exciting particles. Therefore, from a certain point, excitation (and ionization) will be confined to atoms and molecules with a sufficiently low excitation (and ionization) potential; these processes will go on as long as the kinetic energy of the charged particles is greater than the lowest electronic excitation potential.

A case which is of particular interest is represented by dilute aqueous solutions of many organic and inorganic compounds. It is well known[2] that water itself does not absorb light of wave-lengths greater than about 1800 A., as its first continuous absorption band stretches from 1430 to 1860 A. with a maximum at 1665 A. (~ 7·5 eV.). Therefore, in dilute aqueous solutions, at electron energies greater than about 7·5 eV., chemical effects will be due mainly to the action on the water ('indirect effect'), as most of the radiation energy will be absorbed by the solvent (water). In this region, there will only be a relatively small 'direct effect' on the solute, proportional to its concentration. However, the situation will be different when the exciting particles have energies less than about 7·5 eV., as in this region excitation of optical levels of substances with absorption bands in the nearer ultra-violet and in the visible region may become important.

Although it is difficult to give a detailed theoretical treatment of this effect, the action of charged particles should, according to Fermi's theory[4], lead to the excitation of atoms and molecules, and could produce an effect similar to the photo-excitation by a light quantum of corresponding energy. From Fermi's theory[4] the cross-section, q, for such an excitation process is given, to a first approximation, by:

$$q \propto [\int \alpha(\nu) d\nu]/v^2,$$

where $\alpha(\nu)$ represents the optical absorption coefficient for the frequency ν and v is the velocity of the particle; thus, this excitation cross-section is proportional to the optical transition probability and inversely proportional to the square of the velocity of the exciting particle.

It is obvious that the yield of this excitation effect is proportional to the concentration of the solute component under consideration. Therefore, this effect will, in general, lead to a dependence on the concentration of the solute, which is different from that arising through the interaction of the solute with the radicals formed by the 'indirect effect', that is, by the action of the radiation on the solvent.

Some estimate of the order of magnitude of the increase in the chemical yield due to this 'direct' effect can be made as follows: if one assumes that the energy (W) necessary to create an ion pair in liquid water is of the same order as in the gaseous state ($\sim$ 33 eV.), about three electrons will be produced per 100 eV. Under optimum conditions, that is, when each of these electrons would be capable of exciting one molecule, one may get an additional yield of three excited molecules per 100 eV., due to the low-energy electrons.

For example, with methylene blue (Mb) as solute, the three excited methylene blue molecules, (Mb*), could lead eventually, by reaction with a suitable acceptor (Acc), to three molecules of the corresponding semiquinone (MbH) similarly to the photochemical reaction[5], namely:

$$\text{Mb}^* + \text{Acc} \rightarrow \text{Mb}^- + \text{Acc}^+ ; \ \text{Mb}^- + \text{H}^+ \rightleftarrows \text{MbH}.$$

On the other hand, electronic excitation of a molecule such as hydrogen peroxide should lead to a dissociation resulting in an additional yield of ($3 \times 2 =$) 6 hydroxyl radicals, in conformity with the photochemical primary process in the ultra-violet, namely[6]: $H_2O_2 + h\nu \rightarrow 2OH$.

It is clear that these effects are not confined to aqueous systems and may be of considerable importance whenever one is dealing with any two- or multi-component system, containing a relatively high proportion of solute molecules or other components with absorption bands extending farther towards the longer wave-length region of the spectrum than those of the solvent or of some of the other components.

It also follows that, in the study of the chemical action of ionizing radiations in solution, extrapolation, for example, from more or less concentrated aqueous solutions to the behaviour of water itself, is not permissible without due consideration of such 'direct' effects on the solute.

I wish to thank Prof. R. E. Peierls for many valuable discussions.

Heats of Formation of Gaseous Fluoro- and Fluorochloro-Carbons

THE heat of formation of carbon tetrafluoride was determined by von Wartenberg[1] by measurement of the heat of combustion of potassium in the gas to form potassium fluoride and carbon. We have repeated his work and made similar measurements for several other fully halogenated fluoro-compounds, for which previous experimental determinations were lacking. The general technique used was the same as that of von Wartenberg—in particular, the reaction chamber was of the same size and design as his, and the reaction was likewise initiated by striking a d.c. arc between a graphite rod and a quantity of potassium, filtered from oxide, contained in a nickel crucible. The ignition energy was, however, measured more reliably by recording the arc current and voltage simultaneously on a moving film by means of a double-beam oscillograph. The calorimeter was of the isothermally jacketed type, with kerosene as the calorimetric fluid, the heat capacity being determined electrically.

To minimize errors due to pyrolysis, an excess of potassium was used with each gas. The amount which had reacted was determined by volumetric analysis of the aqueous extract of the solid residue for chloride and/or for fluoride. Although the potassium was manipulated in argon so far as possible, it was also necessary to determine the amount of carbonate in the residue, in order to apply a small correction for heat evolved in the reduction of potassium dioxide by carbon.

In deriving the heats of formation (ΔH_f) from the observed heats of reaction, the values taken for the heats of formation of potassium fluoride and chloride were respectively − 134·5 and − 104·2 kcal./mole[2]. Also, since the carbon produced in the reaction was found by X-ray diffraction to be highly amorphous (contrary to von Wartenberg's statement), an assumed enthalpy decrease of 2·5 kcal./gm. atom was allowed for the transition to graphite[3].

Table 1 gives a list of the average values for ΔH_f for each gas at 25° C., referred to the elements in their standard states. For comparison, the U.S. Bureau of Standards values[2] for the related hydrocarbons and chloro-compounds are included in the table, together with some values derived from recently published heats of combustion of the chloro-compounds[4] (all referring to the gaseous state at 25° C.).

Apart from the case of fluorotrichloromethane, the reproducibility of the results was satisfactory;

Table 1

Fluoro-compound	ΔH_f, kcal./mole	Related compounds	ΔH_f, kcal./mole Ref. 2	Ref. 4
CF_4	− 218 ± 2*	CH_4	− 17·89	—
CF_3Cl	− 171 ± 1	CH_3Cl	− 19·58	—
CF_2Cl_2	− 112 ± 2	CH_2Cl_2	− 21	− 22·8
$CFCl_3$	− 70 ± 4	$CHCl_3$	− 24	− 25·0
		CCl_4	− 25 5	− 22·2
C_2F_6	− 303 ± 2	C_2H_6	− 20·24	—
$(CF_2Cl)_2$	− 213 ± 3	$(CH_2Cl)_2$	− 32	− 30·3
		C_2Cl_6	− 34	− 35·4
C_2F_4	− 162 ± 1	C_2H_4	+ 12·5	—
$CF_2 : CFCl$	− 126 ± 2	$CH_2 : CHCl$	+ 7·5	—
		C_2Cl_4	+ 6	− 3 6

* Cf. von Wartenberg's value, − 231 ± 3 kcal./mole ≡ − 229 kcal./mole when corrected to graphite.

but it is known that they are affected by several errors small in amount though difficult to evaluate; for example, the solid residues after combustion liberated small amounts of acetylene and olefin on treatment with aqueous alcohol, and in several cases the reaction vessel after the combustion was found by mass-spectrographic analysis to contain traces of gaseous fluoro-compounds other than the one under test. An indication that our results are accurate at least within 10 kcal./mole is that, according to the table, the heat evolved in the reaction $C_2F_4 + Cl_2 \rightarrow (CF_2Cl)_2$ should be 51 kcal./mole, whereas Lacher *et al.*[5] by direct measurement found 57·3 kcal./mole (accuracy 1–2 per cent). It may be noted also that the increments in ΔH_f for the replacement of a fluorine atom by a hydrogen atom are within the range (41–52 kcal./mole) which can be inferred from Swarts's measurements of the heats of combustion of various partially fluorinated organic compounds[6].

According to the above results, the C—C and C═C bond-energies in the fluoroethanes and fluoroethylenes tested must be considerably less than in ethane and ethylene respectively, if the C—F linkages have the same average energy as in CF_4.

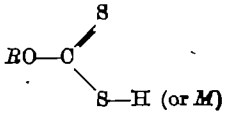
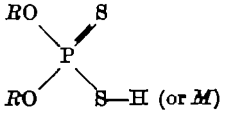
Adsorption of Alkyl Xanthate and Dithiophosphate on a Cleavage Face of Galena as revealed by Electron Diffraction

XANTHATES and dithiophosphate are the two principal collecting reagents in the flotation for sulphide minerals. They have structural formulæ



and



respectively, where *R* is an alkyl group and *M* an alkali metal or ammonium ion. It is generally accepted that the alkyl group may be standing upright on the mineral surface.

One of us has studied the interactions of alkyl xanthate solutions with both fresh and oxidized galena cleavage faces by electron diffraction[1] (galena : PbS, NaCl-type cubic[2] with $a = 5·92$ A.; cleavage face, {100}). With the latter faces the main interaction was the attachment to the surfaces attacked of the precipitated lead xanthate crystallites in fibre orientations[3]. With the former faces, including the slightly oxidized ones, the electron diffraction pattern shown in Fig. 1 was obtained with 100- or 500-mgm./l. solutions. It consisted of diffuse vertical streaks situated on vertically elongated galena spots at any azimuthal setting of the crystal to the electron beams. The pattern gradually changed into two haloes within a few days in air. The streak pattern was interpreted as due to monomolecular patches, presumably of xanthic acid, adsorbed on the sites of the lead atoms of the galena lattice[1]. With this mode of adsorption (Fig. 3*a*) the area occupied by an adsorbate on the galena face is $(5·92 \text{ A.})^2 \div 2 = 17·5 \text{ A.}^2$, a value very near the cross-section of an alkyl group in a solid paraffin[4], namely, $18·5 \text{ A.}^2$.

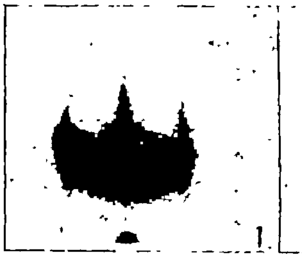


Fig. 1. A diffuse streak pattern obtained on a slightly oxidized galena cleavage face after reaction with aqueous *n*-butyl xanthate, 100 mgm./l.; beam parallel to cube edge

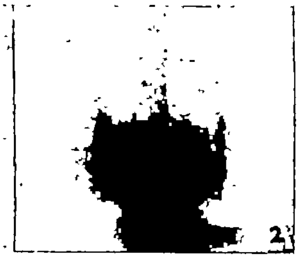

Fig. 2. A diffuse streak pattern obtained on fresh galena cleavage face after reaction with aqueous diethyl dithiophosphate, 10 mgm./l.; beam parallel to cube edge

With alkyl dithiophosphate, however, this mode of adsorption would not be expected, since the cross-section of its anion or its acid molecule may be approximately twice as large as the xanthate anion or xanthic acid molecule. In order to throw light on this problem, an electron diffraction investigation has been carried out on the interactions between a fresh galena cleavage face and diethyl dithiophosphate solutions in distilled water. The crystal specimen was 2 mm. × 2 mm. × 1 mm. in size, and 10 c.c. of the interacting solution was used in every case. The reaction time and temperature were 10 min. and 20° C., respectively.

With a 10-mgm./l. solution, a diffraction pattern (Fig. 2) was obtained three times out of six independent trials. Its characteristic feature was that, with the <100> incidence of electrons to the specimen surface, vertical streaks were observed just in between and just over the Kirchner–Raether lines of the galena cleavage face. With the <110> incidence they were observed just over the Kirchner–Raether lines alone. In the remaining three cases the streaks were weaker in intensity and the pattern as a whole resembled the cleavage pattern closely. With 20- or 5-mgm./l. solutions the streaks were still weaker. With solutions of concentration more than 20 mgm./l. or less than 5 mgm./l. they were not observed at all.

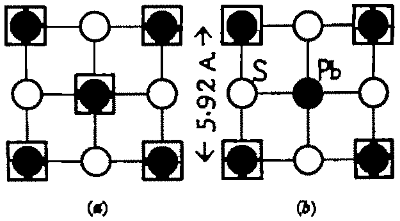

Fig. 3. Schematic representation of the mode of adsorption on galena face of xanthate (a), and dithiophosphate (b). Adsorbates are represented by squares

The interpretation of the present streak pattern may be that diethyl dithiophosphate, whether as acid molecule or as anion, has been adsorbed on the galena lattice with a mode drawn schematically in Fig. 3b. In this adsorption, lead atoms at the sites of the next nearest neighbours of any occupied lead atom on the galena face are occupied by the adsorbates. As compared with the case of xanthate (Fig. 3a) the area occupied by an adsorbate is twice as large in the present case. This may be attributable to the supposed difference in the areas of the cross-sections of dithiophosphate and xanthate, the former being twice as large as the latter.

That the present streaks were not due to surface anomalies of the cleavage face itself was shown by examining a number of randomly selected cleavage samples from the same crystal block from which specimens for the study of adsorption were obtained. In no instance was a diffraction pattern like that represented in Fig. 2 obtained from any portion of the cleavage faces. By the mere soaking of the cleavage face in distilled water containing no dithiophosphate but under otherwise the same experimental conditions, the present streak pattern was not obtained at all. Further details of this work, including interactions with oxidized surfaces, will be published elsewhere.

We are grateful to Mr. Sakano and Mr. Hosoi, of Mitsubishi Metal Mining and Metallurgical Laboratory, for the preparation of the reagents.

Occurrence of μ-CaCO$_3$ in Boiler Scale

DURING small-scale experiments at the Fuel Research Station on the effect of treatment of boiler feed-water on the structure of boiler scales, several deposits were examined by X-ray diffraction. Most of the deposits contained calcium carbonate as calcite and calcium sulphate as anhydrite. In the deposit from one of the experimental boilers, the bulk of the carbonate, however, occurred as the rather unusual hexagonal form, μ-CaCO$_3$, or vaterite. This overlay a thin band of calcite. It is believed that this is the first occasion on which μ-CaCO$_3$ has been reported in such deposits.

There were no notable differences between the conditions of operation of the boilers producing a deposit of a normal type and those producing the deposit containing μ-CaCO$_3$. Periodic analyses of the feed-waters to the boilers showed no appreciable differences in the quantities of calcium, magnesium, sulphate, silicate, total dissolved solids, total hardness, or hydrogen ion concentration. It has not been found possible to explain the presence of this unusual type of carbonate deposit as due to variations in the main characteristics of the feed water, or in the conditions of operation of the boilers.

The occurrence of μ-CaCO$_3$, which is reported to be more soluble than calcite, agrees, however, with the decrease that was recorded in the total weight of the deposit in the boiler, and the accompanying increase in the dissolved solids in the water removed from the boiler. It would follow that while the μ-CaCO$_3$ was being deposited, the boiler water must have been supersaturated with respect to calcite. It is possible that this was caused by the fortuitous appearance in the feed-water of a substance or substances that repress the crystallization of the less-soluble forms of the carbonate. Samples of the feed-water to the various boilers were not examined for their minor constituents; but a comparative spectrographic analysis of the carbonate deposits gave results that were of interest. The most notable differences were that the deposits containing μ-CaCO$_3$ held larger quantities of lead, and smaller quantities of strontium, magnesium and silicon, than those which contained mainly calcite. There was no apparent difference in the phosphorus content of the two types of deposit.

Influence of 'Surface Chilling' on the Detonative Behaviour of Cast Trinitrotoluene

IN an earlier communication[1], attention was directed to the influence of charge-cooling conditions on the detonation velocity of cast T.N.T. Since this effect is of considerable interest by virtue of its bearing on the various theories put forward to account for the initiation of the explosive decomposition at the shock wave front, and because of its importance in connexion with the study of marginal confinement effects in cast explosives, the following examples of its operation are presented.

Charge casings of lead, copper and steel were employed. The degree of 'surface chilling' was varied by heating the charge-casing prior to pouring in the molten T.N.T., and in one case further variation was obtained by slower cooling of the charge after casting. Special casting techniques were employed in order to avoid cavitation of the cast charges. The velocities of detonation obtained using the Dautriche method[2] are recorded in Table 1. The degree of confinement S expresses the number of grams of metal per sq. cm. of charge surface.

Table 1

Confining metal	Casing temp. (° C)	S (gm./sq. cm.)	Density (gm./c.c.)	Mean velocity of detonation (m./sec.)
Lead	20	6·6	1·60	6,820
	70	6·6	1·57	6,430
Steel	20	2·2	1·59	6,760
	83	2·2	1·57	6,480
Copper	20	3·3	1·58	6,795
	57	3·3	1·57	6,580
	90*	3·3	1·56	5,900

* Slower rate of cooling after casting

The velocity of detonation of cast T.N.T. under conditions of heavy confinement is therefore very dependent on the charge-casing temperature prior to filling and on the subsequent rate of cooling. In the usual method of casting into cold casings, the initial cooling at the periphery of the charge is very rapid by reason of the high heat capacity and thermal conductivity of the metal casing producing a finely crystalline peripheral layer.

Up to the present, the prevalent idea has been that conditions at the centre of the charge mainly determine the detonation velocity. While this may be the case in theoretical treatments involving the assumption of uniform charges, in practice, when dealing with cast charges where complete uniformity is difficult or impossible to obtain, it would appear to be the conditions existing at the surface of the charge which are the more important.

Thus, some workers, by a comparison of the detonation velocities of comparably confined charges using ordinary 'clear cast' and 'creamed T.N.T.' in which the crystal size was reduced by stirring while solidification was occurring, observed no significant difference and concluded that changes in grain size were without effect on the detonation velocity. This observation may be accounted for by the production of the finely crystalline peripheral layer as indicated above, so that further reduction in the crystal size of the interior of the charge has very little additional effect. Many other reported cases of 'anomalous' detonative behaviour in cast T.N.T. charges may be similarly explained in terms of different surface cooling-rates.

Similarly, in investigations on the influence of different types of metallic confinement on the detonation velocity of cast charges, the influence of the thermal properties of the casing also requires consideration, since they may introduce differences into the crystalline character of the charge periphery. If the appreciable differences in the thermal properties of the materials normally employed in this kind of work are considered, it would appear that this factor might often assume significant proportions. It has, however, so far received little attention.

The present experimental results serve to emphasize the importance of accurate crystallographic control in all work with cast explosives.

I wish to thank the Chief Scientist, Ministry of Supply, for permission to publish these results.

Cathodoluminescence of Air, Quartz and Metal Films

THE luminescence of air and fused quartz under α-particle irradiation has been observed previously using a photomultiplier[1]. The luminescence spectra of these and other materials excited by 100-keV. electrons have now been studied with a quartz spectrograph. The electron beam was obtained from a discharge tube, fitted with a metal Lenard window, the specimens being placed in external contact with the window. This method of exciting 'scintillation' spectra is advantageous since the specimens can be readily inserted, the luminescence is much more intense than that excited by the α-particle sources used by other observers[2,3] and the self-luminosity of such sources[1,4] is eliminated.

The cathodoluminescence spectrum of air consists of a series of lines in the visible and near ultra-violet, similar to that excited by polonium-210 α-particles[2-4]. The spectrum of fused quartz consists of a continuum in the same spectral region. The quartz exhibits phosphorescence which persists for several minutes after the irradiation and is similar to that observed from fused quartz envelopes of hydrogen and mercury discharge lamps[5,6]. The superimposed air and quartz spectra, recorded when the quartz plate was separated from the Lenard window by a thin air layer, are reproduced in Fig. 1*a*. Fig. 1*b* shows the calibration mercury discharge spectrum.

Other observers[3,7] have reported luminescence of thin metal films bombarded by α-particles. An attempt has therefore been made to observe the similar light emission to be expected under intense electron bombardment, using thin foils of gold, silver, aluminium and tin. No luminescence of the metal foils has been found. When the metal foil was mounted on a quartz plate, the spectrum observed was identical with that from the quartz alone, apart from the reduction in intensity due to the incident energy dissipated in the foil. When the metal foil was mounted in air, the spectrum observed was identical with that from the air alone. In each case no luminescence was found unless the electron beam penetrated into the medium (quartz or air) beyond the foil.

These results suggest strongly that the previous observers[3,7] have been in error in attributing luminescence effects to thin metal and other films, due to their neglect of the luminescence from the air or from the quartz plates on which the specimens were usually deposited. A careful examination of their reports is fully consistent with this hypothesis

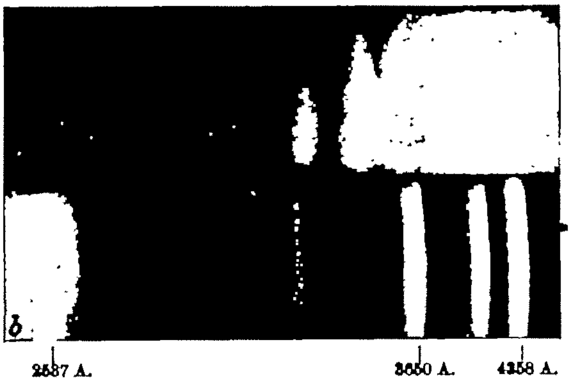

Fig. 1. *a*, Spectra of air and quartz; *b*, calibration mercury discharge spectrum

Richards and Cole[7] find that the thin-film 'luminescence' disappears when the α-particles are just unable to penetrate the film into the medium beyond (air). The 'luminescence spectra' of the aluminium, copper and gold films recorded by Norman *et al.*[3] appear identical with that of the quartz plate on which they were deposited. The latter can be seen clearly in the gap between two metal films on one of their photographs (spectrum *d*).

It is concluded that there is, as yet, no satisfactory evidence for light emission from thin films of metals and other 'non-luminescent' materials excited by ionizing radiation. A similar conclusion was drawn previously from the photomultiplier studies using α-particle irradiation[1].

Automatic Particle-sizing by Successive Counting

The development of automatic apparatus, generally employing optical scanning systems in conjunction with electronic counters, for determining the number and size of a population of small particles randomly dispersed in one plane has aroused considerable interest during recent years. Walton[1] has summarized some of the chief trends and methods used in the design and operation of such apparatus. Hawksley[2] has pointed out that, whereas counting can be carried out by relatively simple instruments, all proposals for methods of size determination have involved the measurement of pulse-heights or pulse-lengths from the records obtained from photoelectric scanning devices. He showed, however, that it is possible to derive a value for the mean diameter of the particles from a series of counts made with scanning spots of different sizes, so that sizing can be carried out with simple counting apparatus. He also implies that similar results could be obtained if the 'response-level' of the detecting device is altered during successive counts, but fails to follow up this suggestion.

In the course of designing an apparatus for the automatic counting of neps (small tufts of entangled fibres) in carded webs, we find that we have unconsciously elaborated Hawksley's suggestion, and as the technique involved is much simpler than that involving quantitative variation of the size of small scanning spots, it may prove to be of general interest.

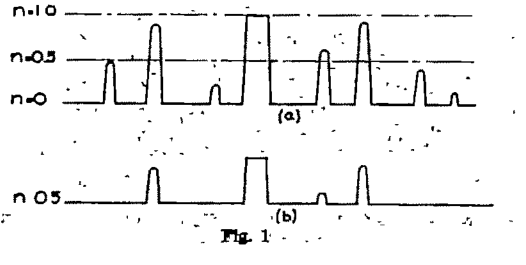

Fig. 1

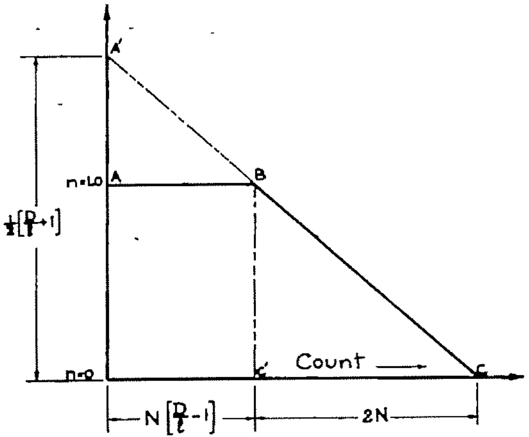

Fig. 2

The apparatus mentioned consists of two plate-glass disks 14 in. in diameter, between which the specimen to be examined is sandwiched. The disks rotate at fixed speed (30 rev./min.) and the area of the sample is scanned in spiral fashion by a photoelectric scanning head of the usual pattern moved by a lead-screw along a radius of the disks. The photocell output, after suitable linear amplification, is modified in the following manner before being fed to an electronic counter of conventional type.

In the ideal case, in which the sample scanned consists of a series of opaque circular spots on a uniformly transparent or translucent background, the amplified photocell output consists of a series of positive-going voltage pulses of varying heights, as shown in Fig. 1*a*. The smaller pulses are due to partial cut-off of the light by a particle, the highest ones to complete cut-off, and if the size of the scanning spot is small compared with the diameter of the largest particle, many of the particles will produce more than one pulse, so that the pulse number is in general greater than the total number of particles. This amplified signal is fed to a biased diode clipping circuit, which permits only pulses exceeding a certain amplitude to be passed on to the counter. The level at which clipping occurs is variable by adjustment of the diode bias, and is designated as n, varying from 0 to 1. At $n = 0$, no clipping occurs; at $n = 1$, the highest pulse is just clipped out, and no counts are registered. Fig. 1*b* shows, for example, the signal passed to the counter when $n = 0 \cdot 5$ in the case of the input signal shown at Fig. 1*a*.

It may easily be shown that

$$\frac{C}{N} = \frac{L + D - 2nL}{d + L},$$

where C is the total counts registered by the counter; N is the total number of particles present; D is the average diameter of the particles; n is the clipping level as defined above; L is the width of the scanned track (at right angles to the direction of scan); d is the width of the unscanned track left between adjacent scanned tracks.

This relation is subject to two assumptions, namely, (*a*) L is less than the diameter of the smallest particle present; (*b*) D is negligible compared with the total width of field scanned.

If the width of the scanning track and the pitch of the scan spiral are adjusted so that $d = 0$ (that is,

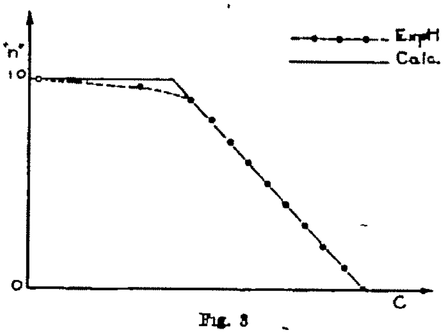

Fig. 3

the whole of the field is scanned, and not just part of it), then

$$C = N\left(1 + \frac{D}{L} - 2n\right).$$

Plotting the experimental count C against the clipping-level n results in a curve similar to the line ABC in Fig. 2. Here $AB = OC^1 = N\left[\frac{D}{L} - 1\right]$, $C^1C = 2N$, and if CB is produced to cut the n-axis at A^1, then $OA^1 = \frac{1}{2}\left[\frac{D}{L} + 1\right]$. Hence, by counting the specimen at successively increasing values of n and plotting the resulting relation, both the number of particles and their average diameter may, in theory, be determined.

Experimental tests carried out on 'ideal' specimens consisting of small punched cardboard disks of known diameter randomly distributed between the glass disks and scanned and counted in the manner described fully confirm the mathematical theorem. Fig. 3 shows a plot of a typical run, superimposed on the expected relation. The agreement is very good except for some rounding of the corner at B, but this does not interfere with the use of the curve in the manner described above.

The following table summarizes the results obtained with four different arrays of particles, of which two consisted of mixtures of particles of different sizes.

Actual array tested			Experimental values obtained			
Details of array examined	N (total)	$\bar{D}$ (in.)	N (total)	$\bar{D}$ (in.)	% error of N	% error of D
100 of diam. 0·1 in.	100	0·100	101·1	0·098 (7)	+1·1	−1·8
30 of diam. 0·1 in.	30	0·100	29·5	0·100 (2)	−1·6	+0·2
30 of diam. 0·1 in. 30 of diam. 0·1275 in.	60	0·113 (7)	61·2	0·110 (8)	+2·0	−2·5
10 of diam. 0·084 in. 10 of diam. 0·100 in. 10 of diam. 0·1275 in.	30	0·104	29·1	0·104 (8)	−3·0	+0·8

Width of scan track = 0·05 in.; scanned at 20 lines/in. (Each experimental value is the mean of five determinations).

Effect of Vapours of Halogen Compounds on the Emission of Positive Ions from Platinum

It was observed by C. W. Rice in 1944 that the emission of positive ions from a platinum anode heated in air is increased very markedly when vapours of compounds containing halogens such as carbon tetrachloride, chloroform, 'Freon', sulphur hexafluoride etc., strike the anode surface[1]. We have studied this phenomenon, the Rice effect, and obtained the following results.

(*a*) The positive ion current, once increased, falls off again to its original intensity even though vapour of the halogen compound is continually supplied; and as W. C. White[1] observed, the effect of the vapour reappears only after air alone has been admitted for some time. (As halogen compounds carbon tetrachloride, chloroform and methyl chloride were used and they all gave similar results.)

(*b*) The Rice effect can be observed as long as the inherent positive emission, usually the alkali ion, from the anode persists; and the anode that has been freed from the alkali ion emission by flashing and become unable to give rise to the Rice effect regains its ability if a slight amount of potassium or sodium chloride is applied to its surface.

(*c*) If a small amount of the vapour of a halogen compound is mixed for a few seconds at a time with the air current passing by the platinum wire anode, the Rice effect can be made to occur many times successively with ever-decreasing intensity until it is entirely suppressed by some sort of surface contamination. The total amount of positive ions thus produced may amount to about one and a half times the total amount of alkali ions emitted from a fresh piece of platinum wire of the same length heated in an air current until it ceases to emit. The latter amount has been found to be substantially the same for every piece of the wire tested and independent of the temperature of heating. (In the case of alkali ion emission from platinum at 1,300° K. in the presence of oxygen, the ratio of the number of positive ions to that of neutral atoms is, according to the Saha–Langmuir–Kingdon's equation, so large that the number of positive ions cannot be increased materially by any increase in the electronic work function as a result of the adsorption of halogen.)

(*d*) For the Rice effect to occur, the presence of air or oxygen is indispensable, because the positive ion emission from the platinum anode in vacuum, far from being increased, is actually decreased if the halogen compound vapour alone is admitted.

(*e*) In the absence of oxygen, carbon tetrachloride vapour produces a considerable negative emission which persists even after the complete removal of the vapour; details of this effect will be reported in due course.

(*f*) The platinum anode surface on which the Rice effect has just taken place shows a 'leopard-skin pattern, presumably of carbon deposited from the halogen compound, and becomes mossy in a few days at room temperature in vacuum or in air. If the Rice effect has not occurred, due to the absence of oxygen or alkalis or to some unknown causes the platinum surface looks clean at first but becomes mossy as in the previous cases.

(*g*) Platinum as incandescent anode material is not essential to the Rice effect. Other oxidation resisting materials such as nichrome can also be used.

W. C. White[5] considers that halogen 'speeds up' the formation of alkali positive ions from alkali neutral atoms, for it has the highest electron affinity among the elements. His assumption is, however, contrary to the effects in paragraphs *c* and *d*.

We are rather inclined to assume that the Rice effect may be due to the production of some new species of positive ions in some way by a surface reaction between oxygen and vapours of halogen compounds which seems to be related to the presence of alkali ions.

The Rice effect is a significant observation in the field of positive ion emission, and the present work is now being continued in an attempt to find a clue to the study of some aspects in heterogeneous catalysis in gaseous reactions.

Effect of Shoot Orientation on Leaf and Shoot Development

FACTORS influencing leaf shape are listed by Ashby[1] and include light intensity, length of day, mineral content of the soil and water supply. In the course of research on the behaviour of the rhizome of *Agropyron repens*, it was found that the form of the growing leaves and also the development of the rhizome was markedly affected when the orientation of the rhizome was changed, so that the gravitational force acted along the shoot in a basipetal direction instead of across it. Direction of gravity as a factor controlling leaf shape does not appear to have been reported previously.

One of the problems to be solved concerning the development of rhizomes is to elucidate the causes which eventually transform the tip of the subterranean rhizome into an orthotropic aerial shoot after a period of rhizome growth. In *A. repens* it was observed that aerial shoot formation is preceded by a change in the response of the rhizome to gravity, the tip becoming negatively geotropic and curving up into the vertical position. The change of shoot form which follows is marked by the replacement of the scale-leaves of the rhizome by a transitional series of leaves and ultimately by aerial foliage leaves.

It was found that the rhizome of *A. repens* could be induced to change prematurely into an aerial shoot, with the accompanying change of leaf form, by placing the rhizome tip so that it pointed vertically upwards. This was done with a number of young rhizomes, and it was found that the complete change generally took ten days. The first transitional leaf appeared after 4 or 5 days. As the rhizome terminal bud contains 4–5 developing leaves which emerge at 2–3 day intervals, it follows that the transitional leaves at least are formed by the modification of growing leaves which would normally have developed into scale-leaves.

This change could not be induced by placing the rhizome tip so that it was pointing vertically downwards. It is therefore clear that it is caused by gravity acting in a basipetal direction along the length of the rhizome, and is not a response to the multilateral stimulus of gravity. This was confirmed by the fact that detached rhizomes, which showed a similar behaviour to attached ones, did not change into aerial shoots when rotated on a klinostat in the horizontal plane about their long axes. The change from a rhizome to an aerial shoot in *A. repens* therefore seems to be the result of the fact that at the end of the summer the rhizome tip curves round so that it points upwards.

Further experiments revealed the fact that, while in the transitional state, young attached shoots could be made to revert to forming rhizome tissue again by returning the shoots to the horizontal position. When this was done, a series of leaves showing a transition in form back to the scale-leaf appeared. When first returned to the horizontal position, the shoots showed a strong negative geotropism, necessitating frequent adjustment to keep the shoot horizontal. This tendency disappeared as the rhizome form was resumed. Mature aerial shoots could not be made to revert to the rhizome form, suggesting that in the vertical position the course of development of the shoot apex eventually becomes permanently changed so that it can form only the organs of the aerial shoot.

These experiments have been repeated using the rhizome of *Sporobolus virginicus*, a common grass on the sandy beaches of the Caribbean. Similar results were obtained, though the response to change in position of the shoot was much slower than in *Agropyron repens*.

It is therefore apparent that in these two grasses the plagiotropic tendency shown by the rhizome serves not only to keep it below the soil surface, but also to preserve the form of the rhizome by preventing the development of aerial shoot organs.

Part of this work was carried out in the University of Sheffield, during the tenure of an award from the Department of Scientific and Industrial Research.

Influence of Leaf Activity on the Composition of the Wood Cell Wall

NEARLY twenty years ago, Clarke[1] discovered a relationship between fibre wall composition, as revealed by botanical lignin reagents, and the variation in strength of home-grown ash (*Fraxinus excelsior*) timber. His subsequent observations on some three hundred other hardwoods demonstrated the wide application of this relationship and at the same time brought to light a marked difference between temperate and tropical species[2]. The latter were found to be more resistant to compression along the grain but weaker in impact bending-strength than the temperate hardwoods on a weight-for-weight basis; they also showed a much stronger reaction with the traditional lignin reagents. Comparison of timber grown in the tropics with that of the same or closely allied species grown under temperate conditions indicated that the kind of lignin reaction must be related to a geographical or climatic factor and not to generic constitution.

Recently, evidence has been found that the controlling factor in lignification (in the botanical sense) of the fibre walls is the illumination received by the leaves. The hypothesis originated during a survey of the variation in lignification of English ash, when it was noticed that the spring-wood zone of each annual ring consistently gave a poor lignin reaction irrespective of the degree of lignification in the remainder of the ring. It is known from previous work[3] that the spring-wood in ash is formed before the leaves have expanded, and this now suggested that whereas starch, or other stored food material, already present in the stem can suffice for cambial growth, lignification of the new fibres is dependent on some product associated with leaf activity. Further substance was given to the hypothesis by the observation that the spring-wood in the annual ring of wood next to the pith, by contrast with the spring-wood in subsequent rings, showed good lignification: this first annual ring corresponds with the terminal shoot, in which leaf development from the terminal bud precedes wood development.

Confirmatory evidence for the hypothesis was obtained from the following pilot experiment. A hood was placed over the upper portion of a coppice shoot of ash early in May 1953, shortly after the buds had burst and the leaves were no more than 2 in. long. A fortnight later, the hood was removed and the etiolated leaves exposed to normal illumination for a month. The hood was then replaced for another three weeks and finally removed in mid-July. Transverse sections, 12 μ thick, were taken at intervals along this stem and stained with safranine followed by fast green. These showed that the 1953 growth-ring in the hooded portion of the stem contained alternate zones of unlignified and lignified fibres corresponding respectively with the alternating periods of hooding and exposure of the leaves to light (Fig. 1). A control stem growing from the same stool, on the other hand, showed the usual pattern of lignin reactions, the 1953 extension shoot being lignified throughout, whereas the increment around the 1952 shoot was poorly lignified in the spring-wood and well lignified in the summer-wood.

In view of the observations recorded above, it seems reasonable to attribute the greater lignification of tropical timbers to the exposure of the tree crowns to more adequate solar illumination in the tropics.

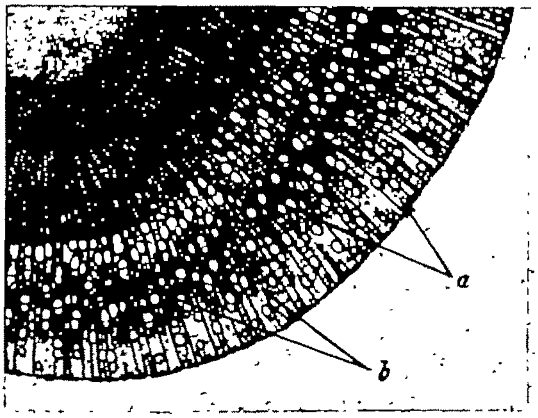

Fig. 1. Transverse section of experimental shoot of ash taken near tip of 1952 growth. Stained safranine, and fast green; photographed with green filter. The red-stained, lignified tissues appear darker than the poorly lignified (green-staining) portions. The 1952 growth-ring formed under normal illumination is well lignified throughout. In the 1953 ring the dark zones (a) correspond with periods when the shoot was exposed to normal sunlight, and the lighter zones (b) to periods when it was hooded. × 12

These findings point the way to research which may lead to a better understanding of the mechanism of woody growth. They should also give more precise direction to the investigation of relationships between environmental factors and timber quality, investigations which have been handicapped in the past, not only by the difficulty of distinguishing the effects of the various environmental factors, but also by the lack of any specific knowledge of the physiological mechanism through which such factors operate.

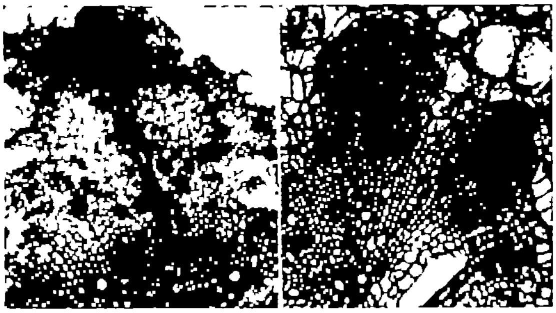
Adventitious-Root Formation by Fungal Pathogen Metabolites as a Possible Mechanism of Disease Resistance

In a previous paper[1] it was demonstrated that adventitious-root formation, due to *Fusarium vasinfectum* metabolites, is confined to the wilt-resistant 'Ashmouni' cotton cut shoots, while the susceptible 'Giza 26' cotton variety fails completely to initiate any root development. The comparative readiness of a resistant variety to form adventitious roots in response to the metabolites of the specific fungal pathogen on host extract, and the failure of a susceptible variety to manifest such response, have been further tested and verified with other species of *Fusarium* as well as cotton and tomato varieties. The present work has been carried out in an attempt to elucidate the two following problems (*a*) the metabolitic potentialities of *Fusarium solani* (cf. Snyder and Hansen) to stimulate adventitious roots in wilt-resistant 'Karnak' and susceptible 'Giza 26' cotton varieties, and (*b*) the metabolitic potentialities of two tomato-wilt *Fusarium* species namely, *F. oxysporum* and *F. moniliforme*, to initiate adventitious roots in wilt-resistant 'Myco. 1' and susceptible 'North Dakota' tomato varieties.

Cotton cut shoots. Aqueous extracts, from two-week old 'Karnak' or 'Giza 26' cotton seedlings, were prepared and each extract was divided into two portions: one portion was autoclaved and the other cold-sterilized by Menon's technique[2]. *Fusarium solani* was grown on these differently treated extracts at 30° C. for 28 days, and the resulting fungal filtrate was further subdivided into two lots: one lot was left unheated and the other boiled for 15 min. Fresh healthy cut shoots, from four-week old 'Karnak' or 'Giza 26' cotton seedlings, were then inserted into differently treated filtrates. Control experiments were also made with either sterilized water or unconsumed seedling extract as the dipped medium. The treated cut shoots were left at ordinary laboratory temperature and examined regularly.

Unheated *Fusarium* metabolites, on cold-sterilized 'Karnak' seedling extract, have proved to induce adventitious-root formation in cut shoots of the same cotton variety; the interfascicular cambium (opposite the primary medullary rays) is stimulated to divide actively and produces a mass of meristematic cells which become later differentiated into an adventitious root (Fig. 1*a*). On the other hand, *Fusarium* meta



(a) (b)

Fig. 1. Transverse sections in treated cut shoots of: (a) 'Karnak' cotton variety in response to *Fusarium solani* metabolites (× 80); (b) 'Myco. 1' tomato variety in response to *Fusarium moniliforme* metabolites (× 66)

bolites on 'Giza 26' extract fail completely to induce any root initiation in its own cut shoots. The restriction of adventitious-root formation to *Fusarium* metabolitic potentiality on 'Karnak' extract, and its failure to produce such growth factor on the susceptible 'Giza 26' extract, have been further emphasized by similar cut-shoot experiments with different tomato varieties.

Tomato cut shoots. Cut shoots—from either the susceptible 'North Dakota' or the relatively resistant 'Myco. 1' tomato variety—were tested for their potentialities to produce adventitious roots in response to metabolites of two tested pathogenic Fusaria species (namely, *Fusarium oxysporum* and *Fusarium moniliforme*) on differently treated tomato extracts. 'Myco. 1' cut shoots were induced for adventitious-root formation in response to *Fusarium* metabolites (Fig. 1b); root initiation starts at an early stage, and the induced adventitious roots could soon be detected macroscopically. On the other hand, no detectable adventitious roots were observed in response to the insertion of the susceptible 'North Dakota' tomato cut shoots into *Fusarium* metabolites on their own extract. The thermostability of the growth metabolitic factor, responsible for root stimulation in 'Myco. 1' cut shoots, has been demonstrated by the comparable stimulatory effect of both autoclaved and cold-sterilized *Fusarium* metabolites.

The differential responses of host varieties to fungal pathogen metabolites, as demonstrated by the readiness of a resistant variety or the failure of a susceptible one to develop adventitious roots, might indicate that the initial fungal penetration—which has been proved to take place in both resistant and susceptible varieties—exerts an influence on the host vigour to some extent. The detection of a metabolitic growth factor in a resistant variety—as manifested by adventitious-root formation—might contribute to its resistance by: (a) the toxic effect of the fungal wilt-inducing metabolite is partially or completely eliminated by the opposing action of the associated metabolitic growth factor, and (b) the physiological function of the susceptible-variety roots ceases, either partially or completely, due to fungal infection and interference. On the other hand, induced adventitious roots—due to fungal metabolitic potentiality—enable the resistant variety to compensate for the physiological disturbance imposed upon the original infected primary roots and result in either postponing or interfering with the manifestation of the wilt symptoms. The further significance of this mechanism of disease resistance, and the elucidation of either one or the other of the two suggested possibilities, still require further investigation.

A Colour Test for detecting Swollen Shoot Disease in Gold Coast Cacao

Hancock[1] reported a colour test for diagnosing swollen shoot disease in *Theobroma cacao* L.; the method consists of treating transverse stem sections with acidified methyl alcohol; but as the results require statistical analysis, it is of little practical value. Later, Lindner, Kirkpatrick and Weeks[2] described a staining technique for detecting viruses in the leaves of woody plants which involves extracting chlorophyll from the leaves and producing a colour reaction in the cleared leaves using normal sodium hydroxide and lactic acid.

The method of Lindner *et al.* failed to give definite indications of virus infections in cacao; but a modified technique using expressed sap has proved successful. 10 gm. of mature leaves, selected at random from all parts of the plant, are macerated with 25 ml. of distilled water and squeezed through muslin; 2 ml. of the extract is then heated to boiling point with an equal volume of normal sodium hydroxide. It is preferable to clarify the cooled samples by centrifuging at 8,000 r.p.m. for 2 min. The supernatant liquids are then made up to 6 ml. by the addition of further normal sodium hydroxide.

The colours developed are variable; but provided that strictly comparable leaf material from healthy trees of the same age and type as those under test is used as a control, infections can be diagnosed before any external symptoms are produced on the growing plant. Infected leaves produce a red-brown to crimson colour, and healthy leaves lime-green to greenish-brown.

This communication is published with the approval of the Director, West African Cacao Research Institute.

Chlorophyll in Young Shoots of European Beech (*Fagus sylvatica*) in Winter

Chlorophyll *a* and *b* has been observed in the xylem rays and in the pith in young shoots of *Fagus sylvatica* and several other species of trees including *Populus*, *Alnus* and *Betula*. The chlorophyll is localized in chloroplasts in cells rich in starch. The possibility of chlorophyll being stored in the cells of the pith and xylem rays in winter could not be excluded; but the transport of chlorophyll within the plant would have to be demonstrated.

Extracts were made from bark, buds and xylem of *Fagus sylvatica*, and concentrations of total chlorophyll and chlorophyll *a* and *b* separately were de-

CHLOROPHYLL IN *Fagus sylvatica*

	Chlorophyll *a* plus *b* (mgm.)			
	per 100 gm. of fresh weight	per 100 gm. of dry weight	per 50 cm.² surface	*a*.*b*
Xylem	17	35	—	1·3
Bark	47	72	0·5–1·2	3·5
Young leaves in buds	85	73	—	2·2

termined in a Coleman spectrophotometer. The pigments were separated by paper chromatography according to the method described by Sironval[1]. The results are summarized in the accompanying table.

The rather low ratio of chlorophyll *a* to *b* in the xylem is of interest; it ranges from 1·1 to 1·6 in different preparations, the average being 1·3. The lowest ratio previously found was 1·4 (submersal green algae). As only 2 per cent of the light passes through the bark layer of young twigs of *Fagus*, of course no photosynthesis could be expected to occur in the xylem.

Although the total chlorophyll concentration in the bark is low as compared with that determined in leaves of the same plant exposed to sunlight (770 mgm. chlorophyll *a* and *b* per 100 gm. dry weight, or 3·2 mgm. per 50 cm.² surface[2]) the ratio *a*:*b* of 3·5 corresponds to the ratio normally found in photosynthesizing tissue. This is not surprising, since the bark of trees in the light is known to resynthesize the carbon dioxide released by respiration of living cells in bark and xylem.

Blood Groups of Human Blood Platelets

In tables which they published recently, Stephanini and Plitman[1] described the existence of four blood groups in human blood platelets, while Harrington and his collaborators[2] describe the existence of eight such blood groups. Their research was based on the agglutination of platelets.

For our part, by absorbing anti-*A* and anti-*B* serums with highly concentrated suspensions of platelets, we were able to show the presence in these elements of the *A* and the *B* agglutinogens in persons belonging to the *A*, *B* or *AB* groups, while we found these antigens absent from platelets of the *O* type. However, such results were obtained only with platelet suspensions containing twenty million elements per c.mm., and after crushing these elements prior to the absorption of serums.

Controls were made with physiological liquid, serum and plasma, as well as with thick and thin suspensions of red cells, in order to prove that the absorption of antibody was not due to the presence of antigens dissolved in the serum or in the plasma, nor to the presence of red cells persisting in the platelet suspensions. The antibody absorbed by *A*, *B* or *AB* platelets is quite specific and sometimes reaches total absorption from the serums under study.

The serum, plasma and red cells used for the controls were always taken from the donor of the platelets.

Under these conditions, we conclude that: (1) human platelets do contain *A* and *B* antigens analogous to those of red cells; (2) these antigens seem to be located inside the protoplasm of platelets.

Nutritional Availability of Cobaltic Oxide, Co_2O_3

Since Marston's pioneer work[1], numerous investigators have established that cobalt is a essential element in the nutrition of ruminants Sheep and cows reared on diets low in cobalt (les than 0·1 mgm./100 lb. of body weight/day) lose thei appetites, fail to gain weight, become anæmic, and finally become emaciated. The cobalt usually i added to the diet as cobalt chloride, cobalt sulphate or cobalt carbonate, in a mineral feed or in a sal block.

The possibility of using the cheaper, but relatively insoluble, cobaltic oxide, as a cobalt source seeme attractive. To answer the question of whether th cobaltic oxide would provide the cobalt essential fo ruminants, radioactive $^{60}Co_2O_3$, which was prepare in the United States Atomic Energy Commissio piles at Oak Ridge, Tennessee, was fed to lambs Three milligrams of cobaltic oxide containing 27 microcurie units of radioactivity per mgm. were fe daily to 75-lb. lambs for seven days. The animal were sacrificed on the eighth day. Muscle, blood an some of the internal organs were analysed for radioactivity with a scintillation counter. The results ar presented in Table 1. In another experiment a lam was given 10 mgm. of radioactive cobaltic oxide at single feeding and the tissues assayed for radioactivit forty-eight hours later.

Table 1. Concentration of Cobalt-60 in Tissues of Lambs fed Radioactive Cobaltic Oxide

Animal tissue	Cobalt-60 µgm./kgm. of wet tissue		
	1*	2*	3†
Blood	18	72	45
Liver	165	615	100
Heart	6	54	14
Lungs	25	150	12
Muscle	20	10	10
Spleen	68	100	80

* Animals fed 3 mgm. per day for 7 days.

† Animal fed one massive dose (10 mgm.) of radioactive cobalti chloride.

The cobalt of cobaltic oxide was definitely absorbe and distributed throughout the body of the animal The liver proved to be the site at which a large shar of the radioactive cobalt-60 assimilated was concentrated. The results compare favourably with th work of Rothery, Bell and Spinks[2], who fed 50 µgm and 500 µgm. of $^{60}CoCO_3$ to lambs daily ove periods ranging from 90 to 123 days, and with th report of Comar and Davis[3], who studied metabolism of cobalt chloride in rabbits, swine and young calve Approximately 80 per cent of the cobaltic oxide fe orally was found in the fæces, the other 20 per cen probably reacted with the hydrochloric acid in th digestive tract to form cobalt chloride, whic then provided cobalt in a form that was readily utilized.

Corpus allatum and Egg Production in Starved Milkweed Bugs

IN many insects, egg production requires special nutrition[1]. It has also been found, in most insects investigated, that the corpora allata are necessary for the normal function of the ovaries[2]. In the milkweed bug (*Oncopeltus fasciatus* (Dallas), Heteroptera, Lygaeidae), the ovaries of the female at the beginning of the adult stage are only slightly developed (Fig. 1*a*). When the female is kept in an incubator at 25° C. and fed on milkweed seeds and water, the ovaries may, after fifteen days, reach the size shown in Fig. 1*b*. Of fifteen females kept as described, nine had, at the age of fifteen days, already started oviposition, two more contained ripe eggs, while in four specimens the ovaries had only grown slightly. If the females are given only water and no seeds, they may survive for quite a long time, but no eggs are produced. After fifteen days, the size of the ovaries usually (ten specimens) is as shown in Fig. 1*c*, and only a slight growth has taken place.

At the same time, changes are observed in the incretory system. In the emerging female the corpus allatum is small (Fig. 1*a*, *ca*), but increases, as already shown by Novák[3], if she is fed. In the present material it increased to about twelve times the initial volume in fifteen days (Fig. 1*b*). In females given only water, the corpus allatum had, after fifteen days, increased only about 2·5 times (Fig. 1*c*). If the corpus allatum is transplanted from normally fed females in the oviposition period to females fed only on water, the latter will start egg production despite the lack of food. Of fourteen unfed females which thus received corpus allatum from fed females, eleven contained at later examination ripe eggs, two more showed a considerable growth of the ovaries, while only one specimen showed no reaction. Mostly two corpora allata were transplanted to each female, namely, at the age of five and ten days, and the specimen examined at the age of fifteen days; but when the transplantation was done only once, ripe eggs were still obtained. Fig. 1*d* shows the ovary of a fifteen-day old starved female which ten days earlier received the corpus allatum from a fed female. In most cases the corpus allatum was transplanted together with the corpora cardiaca and a fraction of the aorta. However, transplantation of only the posterior half of the corpus allatum with no traces of corpora cardiaca also resulted in egg development. When the females were kept alive for a sufficiently long period, they deposited eggs of normal size and shape. When the females were mated with normal males, the fertilized eggs developed to normal larvæ. In seven specimens muscles were transplanted as controls, but no changes in the ovaries were observed.

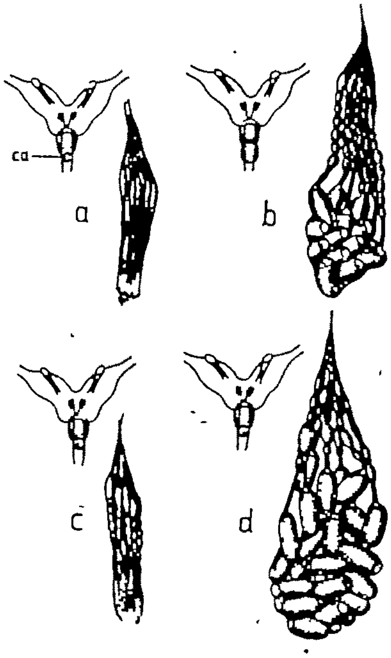

Fig. 1. The brain with the corpus allatum (*ca*) and the right ovary and lateral oviduct of females: (*a*) at the beginning of the adult stage; (*b*) 15 days old, fed; (*c*) 15 days old, starved; (*d*) starved, with corpus allatum transplanted from fed females

In the bug *Rhodnius*, also, fasting influenced both the corpus allatum and egg production[4], whereas in *Tribolium* and *Chrysopha* starvation prevented the normal development of the ovaries but not the growth of the corpora allata[5]. The two results of normal food supply, namely, growth of the corpus allatum and egg production, may in the milkweed bug be explained by presuming a primary influence on the corpus allatum, which then starts to function and secondarily induces egg development.

Direct Observation of Hapten–Antibody Equilibria

IF the bivalency of antibodies, for which there is now considerable evidence, is accepted, it is to be expected that the addition of bivalent hapten to solutions of purified homologous antibody would bring about a linear association of alternating antibody and hapten molecules. The equilibrium extent of this association should be dictated solely by the value of the free energy of formation (ΔF°) of a hapten–antibody bond and the concentration of the two reacting species. Hence a determination of the extent of association would provide the value of ΔF°, and if this were done as a function of temperature the values of the entropy (ΔS°) and the heat (ΔH°) of bond formation would be available as well.

Light-scattering measurements on very dilute mixtures will yield the weight-average aggregate weight since the deviations due to non-ideal behaviour are negligible. The free energy of formation can be calculated in the following way. Let H_0 and A_0 be the initial concentrations of hapten groups and antibody sites respectively and p be the equilibrium fraction of hapten groups reacted. Then the equilibrium constant, K, for the reaction of a hapten group and an antibody site to form a hapten–antibody bond is given by

$$K = \frac{pH_0}{(1-p)\,H_0\,(A_0 - pH_0)}\,.$$

If the reactions are reversible, then equilibrium is established when the mixture is in its most probable state, and using the analysis of Goldberg[1] it can be shown that to a good approximation

$$\frac{M_w}{M_A} = \frac{1 + p^2r}{1 - p^2r},$$

where M_w is the weight-average aggregate weight, M_A is the molecular weight of the antibody, and $r = H_0/A_0$. Thus, from the measurement of the ratio M_w/M_A in a mixture of known concentration of hapten and antibody, p may be evaluated and K and hence ΔF° determined.

In addition to these expectations the dynamic character of the equilibrium should be reflected in the shift of the M_w/M_A ratio upon dilution and upon addition of further amounts of hapten or antibody. Moreover, the value of the ratio should approach unity upon the addition of monovalent hapten. Our observations on several purified antibody preparations using two haptens have verified these predictions and have permitted a determination of the thermodynamic quantities.

The systems studied have been rabbit antiarsanilic antibody, most of which was prepared by the method described by Campbell and Lanni[2], and terephthalanilide-*pp*′-diarsonic acid (T) and adipanilide-*pp*′-diarsonic acid (A). Some results are summarized in Table 1. Unless otherwise specified, the temperature is 25° C.

Table 1

Antibody Pool No.	Antibody conc. (gm./dl.)	Hapten	r	M_w/M_A	ΔF° (k.cal.)
IV	0 040	T	4 3	1·43	−7·59
		T	0·89	1·58	−7 58
		T	0 18	1·14	−7 52
		A	0 95	1·51	−7·49
		A	4 8	1·38	−7 55
X + XI	0 090	T	1 01	1·72	−7 44 (35° C.)
		T	1·01	1 90	−7 35
		T	1 01	2 02	−6·95 (5° C.)

From the results shown here and others the value of ΔF° is found to be $-7{\cdot}5 \pm 0{\cdot}1$ k.cal./mole of hapten–antibody bonds formed under the conditions pH 8·0 borate buffer, ionic strength 0·15 at the temperature 25° C. This average includes two haptens and different preparative procedures applied to two different antisera pools. At equimolar concentration of hapten and antibody, this means that 59 per cent of the antibody exists as 'monomer' (an antibody molecule combined with zero, one or two hapten molecules), 28 per cent as 'dimer', and 10 per cent as 'trimer', when the total antibody concentration is 0·04 gm./dl.

This result is in good agreement with the values obtained for a similar system by Eisen and Karush[3] and Lerman[4], who employed equilibrium dialysi measurements using monovalent haptens.

Applying the van 't Hoff relation to the K valu determined at different temperatures, we obtai approximate values of $\Delta H^\circ = -2{\cdot}4$ k.cal./mol (exothermic reaction) and $\Delta S^\circ = +17$ e.u./mol These values show that the entropy gain constitut the major driving force of the reaction, and, as i the case of a similar observation for the associatio of insulin molecules[5], this suggests that water mol cules are displaced from charged groups when th hapten–antibody bond forms.

In addition to the extension of the results sum marized here, current work is concerned with th detection of heterogeneity of the bonds as might b displayed by deviations of plots of M_w/M_A versu concentration from the relation predicted for a singl ΔF° value, the exploration of the rate of reactio and the extension of the method to acid solutio of specific precipitates.

This investigation is part of a study made possib by a grant from the Rockefeller Foundation. W greatly appreciate the help of Prof. W. C. Boy (Boston University), particularly in the problem antibody preparation, and expect to publish with hi other aspects of this investigation in the near futur

The Marshes of the Medway Estuary in Romano-British Times

J. P. T. BURCHELL (*Nature*, May 1, p. 832) appea to be taking a somewhat short-sighted view by den ing the existence of an ancient pottery site on t Upchurch Marshes of the Medway Estuary.

Investigations carried out by us in recent yea have shown that potting was at least one of th industries carried on in this region during the fir and second centuries A.D. and probably also in t immediate pre-Christian era. This is borne out b the number of wasters (overbaked and distorted pot found on the mud flats, the appearance of whi precludes the possibility of importation from th opposite coast of Gallia Belgica. The absence of kil has in the past been taken as evidence against th existence of potteries. We believe that the olde gritty wares, which fragment rather than warp faulty firing, were fired on level ground under pil of straw and brush-wood, in the same way as ma primitive native wares in modern Africa, which th resemble in type and material. Belgic terra nig certainly blisters on faulty firing, and we have fou numerous good examples. We have also excavat several structures which may well be kiln flues. may also be significant that the modern Upchur potteries, situated about five miles from the mars used, until quite recently, the local estuarine clay.

In view of Francis W. Reader's report of the Red ills Exploration Committee[1], the possibility of salt-anning must be considered. It seems to us rather nlikely that this industry was carried out on the te in Roman times, since the water is now only rackish and loaded with silt, and we have biological ndence that the situation in the first and second nturies A.D. was similar, and indeed that the water ay even have been less saline. We agree that the arshes were inundated, and by plotting the dates finds we have been able to demonstrate the order which various areas became covered by the sea. e fail to understand how any industry involving e use of fire could have been carried out on "the ter-tidal surface of the marsh clay" as Mr. Burchell iggests.

The Ordnance Survey maps of the area (6 in. : mile) are misleading, in that they imply that the arious sites occupy a very extensive tract, whereas, fact, the occupation sites are of very limited extent ad distributed along the banks of ancient creeks[2]. he structural remains are similar to those found on e foreshore of the Thames at Tilbury[3]. We believe at most of the finds have remained *in situ*, and at only in certain areas and in recent times have rosion and redeposition occurred, as evidenced by the istribution of waterworn sherds.

Royal Commission on Historical Monuments, Essex, S.E., p. 80.

MR. J. P. T. BURCHELL, in *Nature* of May 1, p. 832, as made some statements on this subject with hich I cannot agree. The archæological evidence btained from the Upchurch Marshes over a period nearly a century leaves no doubt that the area pported a flourishing potting industry throughout e first and into the early decades of the second ntury A.D. While there is little evidence to suggest intensive occupation of the Milfordhope or Slay-lls Saltings after the Antonine era, there can be no nying that adjacent sites, notably at Otterham reek, were inhabited and producing pottery well rough the third century.

It would be unwise to be dogmatic with regard to e extent of the potting industry in the later Roman riod ; but it is certain that in the first century e output far exceeded local requirements. A few rge storage jars have been traced to London, but would seem that the bulk of the products were anufactured for distribution in the south-east of itain, large numbers of vessels having, for example, en found at Richborough.

It does not follow that we can still accept the bel 'Upchurch Ware' as referring to certain types pottery. The Medway sites produced a wide riety of wares, the majority being common forms at were copied by potters up and down the untry for so long as the shapes remained popular. is therefore the fabric of the vessel rather than its rm that may suggest the place of manufacture.

Mr. Burchell appears to base his archæological evidence on his Samian potters' stamps. It should be pointed out that the number of fragments of Terra Sigillata from the sites is minute compared with that of the coarse sherds. While it is true that most of the Samian fragments are of second century date, this fact cannot seriously be weighed against the overwhelming evidence of the other material.

The evidence on which the above statements are made is both long and complex and clearly cannot be discussed here. However, a research report is to be published in the next volume of *Archæologia Cantiana*. This, following Mr. John H. Evans's invaluable paper on the "Archæological Horizons in the North Kent Marshes" in the present issue of that journal, should do something to clarify an archæological problem that has too long remained unanswered.

Classification of the Terrestrial Heteroptera (Geocorisae)

FOLLOWING Dufour[1], the Heteroptera can be divided into three series : Geocorisae (land bugs), Hydrocorisae (water bugs) and Amphibicorisae (water-surface bugs). Reuter[2] divided the Heteroptera into seven series. One of these, Hydrobiotica, included most of the families of Dufour's Hydrocorisae and Amphibicorisae as well as Saldidae ; the Geocorisae were split into five series, and the other series contained Corixidae only. China[3] followed Reuter with some modifications ; he did not consider Geocorisae a homogeneous group. Börner[4] recognized three primary divisions of Geocorisae : Reduvioidea, Cimicoidea and Pentatomoidea. In the first he included Ochteridae, Saldidae and Enicocephalidae and in the last the Tingidae.

Recent work, carried out by us independently, together with some work by earlier authors, leads to the conclusion that most of the families of Geocorisae fall naturally into two groups ; the evidence is as follows :

(1) Tullgren[5] erected a group, Trichophora, which included families from three of Reuter's series and the Piesmidae ; hitherto the latter had been placed in a superfamily with the Tingidae. The group was characterized by the presence of ventral trichobothria and a basic type of pretarsal pseudoarolia (Tullgren's arolia). Although the Holarctic Aradids are without pseudoarolia, some New Zealand (Myers and China[6]) and Neotropical (Wygodzinsky[7]) species possess pseudoarolia with a basal sclerite, that is, of the Trichophoran type. Southwood finds a similar structure in *Aneurus*. (The term pseudoarolia is used here for the structures below the claws and does not imply homology with those of other orders or those of the Miridae).

(2) Singh-Pruthi[8] demonstrated the presence of two basic types of male genitalia in Heteroptera : a Pentatomoid type occurring in three of Reuter's series (Lygaeoidea and allies, Aradoidea, Pentatomoidea-Coreoidea) and in the Saldidae ; a Reduvioid type occurring in the remaining bugs. Contrary to Singh-Pruthi, Leston finds the male genitalia of *Piesma*, and Southwood that of *Aneurus*, to be of Pentatomoid form.

(3) Leston, from a study of wing venation and areas, confirms Tullgren's Trichophora with the addition of Aradoidea, demonstrates the venational similarity of Tingidae and Reduviidae, shows two related patterns of venation in Reduvioidea and Cimicoidea respectively (including Joppeicidae within the latter) and places Ochteridae and Gelastocoridae in close relationship with Hydrocorisae. Preliminary studies suggest that the Saldidae possess modified Trichophoran venation; Enicocephalidae have a unique venation among land bugs suggesting only that of the wings of Hydrocorisae.

(4) Pendergrast, from a study of the female reproductive organs, concludes that the spermatheca of the Aradidae and Saldidae is of the same type as that found in most Trichophora (including Piesmidae). The spermathecae of Tingidae do not show affinities with this group, but rather with those of Reduviidae and Phymatidae. Gelastocoridae and Ochteridae are clearly close to the Hydrocorisae.

(5) Leston[9,10] noted that eggs of the Tingidae resembled those of the Cimicoidea and were of a different type to those of Piesmidae. Following this, Southwood has shown that there are in fact two well-marked egg types in terrestrial Heteroptera: that characteristic of the Trichophora and Aradoidea and that of the Reduviidae, Phymatidae, Tingidae and Cimicoidea. Enicocephalid eggs, as described by Carayon[11], appear unique among the land bugs. The Trichophora and Aradoidea also agree in the possession of a similar type of egg burster, while hatching spines or ridges occur in all groups.

(6) Southwood has found that the two types of accessory salivary glands described in the Heteroptera by Baptist[12] also support these groups. These structures in Piesmidae and Aradoidea resemble those found by Baptist in the Pentatomidae, Coreidae, Neididae, Lygaeidae and Pyrrhocoridae.

It is proposed to erect two groups within Geocorisae, basing them nomenclatorially on genera and thus following Evans's[13] precedent in Homoptera.

Pentatomomorpha: male genitalia of Pentatomoid form or related thereto; ventral trichobothria (or multiple setose areas) present; hind-wings with radius and media distally separated and subcosta never well developed; fore-wings without a costal fracture; spermatheca single, median, usually with a spermathecal duct, muscular pump and an apical sperm storage bulb; eggs with micropylar processes, these consisting of a central canal (for sperm passage) surrounded by a spongy or porous layer (for respiration); operculum usually absent, but when present without deep follicular pits and not differing greatly in structure from the rest of the chorion; eggs probably never embedded into plant tissue at oviposition; egg burster a single structure situated on the vertex of the embryonic cuticle; accessory salivary glands of tubular type.

Cimicomorpha: male genitalia of Reduvioid form or related thereto; ventral trichobothria absent; hind-wings with radius and media distally fused and subcosta often well developed; fore-wings usually with a costal fracture; true spermathecae absent in Cimicoid families but in Reduvioidea and Tingidae they are paired, laterally placed, usually very thin cuticular sacs, without a pumping apparatus and probably not homologous with the median spermatheca of Pentatomorpha; eggs with micropylar apparatus consisting of canals running in the rim of the chorion surrounding the operculum, which is always present; as shown by Beament[14], micropylar canals of two types, true micropyles (for sper passage) and pseudomicropyles (for respiration), b one type may be absent; operculum strong differentiated from rest of chorion, with deep follicul pits; eggs often inserted into plant tissue; medi egg burster absent; accessory salivary glands vesicular type.

The Pentatomorpha contain Pentatomoidea, Cor oidea, Lygaeoidea (= Neidoidea Reuter), Aradoide Piesmidae and probably Saldoidea (Saldidae a Leptopodidae), but the last-named superfamily certainly far from the main Pentatomorpha ste The Cimicomorpha contains Reduvioidea, Tingida Cimicoidea and Joppeicidae. We follow Blöte[15] considering Scotomedidae (= Velocipedidae) a su family of Nabidae, and Carayon[16] in placing th family in Cimicoidea. Dipsocoroidea are probab allied to the Cimicomorpha. Enicocephalidae a apparently Geocorisae, but the hind-wing venati suggests a distant relationship with Hydrocorisa they are, however, being studied elsewhere. Lack material has precluded any study of Leotichidae.

From our evidence it seems that certain famili sometimes treated as Geocorisae must be remov from this series: Gelastocoridae and Ochteridae a Hydrocorisae. Hence, although recently adopted Poisson[17], the series Telmatobia of Esaki and China must be abandoned, and this already has been do by China[3]. The placing of Mesovelidae and Hebrid in the Amphibicorisae, as done by most authors, supported by the present evidence.

Some families or individual genera do not posse all the basic characters of either series: many ha reduced venation (for example, Dipsocoroidea) or a apterous (for example, Cimicidae, Polyctenidae); true spermatheca is absent in *Aneurus* (Aradoidea ventral trichobothria are lacking in Saldoidea.

For details of the internal anatomy of Cimicoid and other matters we are indebted to Dr. J. Carayo Entomologie Agricole Coloniale, Paris.

FORTHCOMING EVENTS

*(Meetings marked with an asterisk * are open to the public)*

Monday, July 12

hysical Society (at the Royal Institution, 21 Albemarle Street, odon, W.1), at 2.30 p.m.—Prof. C. Kittel (University of California): icrowave Experiments in the Physics of Solids".*

Monday, July 12—Friday, July 16

niversity of Liverpool (in the Department of Zoology, The iversity, Liverpool)—Symposium on "The Comparative Endo- inology of Vertebrates".

Monday, July 12—Saturday, July 17

ociety of Chemical Industry (at Liverpool)—73rd Annual eting.

Tuesday, July 13—Saturday, July 17

Physical Society (joint conference with Bristol University d the Institute of Physics, at the University, Bristol)—"Physics the Solid State".

University of Glasgow (in conjunction with the International nion of Pure and Applied Physics and Unesco, at the University) Conference on "Experimental and Theoretical Nuclear Physics". airman: Prof. P. I. Dee, F.R.S.

Thursday, July 15—Saturday, July 17

Royal Meteorological Society (in the Department of Natural ilosophy, The University, Drummond Street, Edinburgh)—Summer eting.*

Friday, July 16

Biochemical Society (in the Department of Biochemistry, Queen's iversity, Belfast), at 11 a.m.—Scientific Papers.

National Institute of Agricultural Botany (at Huntingdon ad, Cambridge), at 2.15 p.m.—Annual General Meeting.

Friday, July 16—Wednesday, July 21

Joint Commission on Electron Microscopy International uncil of Scientific Unions (at the London School of Hygiene d Tropical Medicine, Keppel Street, London, W.C.1)—International nference.

APPOINTMENTS VACANT

Applications are invited for the following appointments on or ore the dates mentioned:

Research Demonstrator in Physics—The Registrar, University llege, Leicester (July 16).

Agricultural Economist (graduate, preferably with qualifications economics and horticulture or agriculture)—The Registrar, Wye llege, near Ashford, Kent (July 17).

Assistant Lecturer (preferably with some experience in microbiology or plant biochemistry) in Botany—The Secretary, Birkbeck llege, Malet Street, London, W.C.1 (July 17).

Farm Demonstrator (with a degree in agriculture and farming perience), for duties which will include practical instruction on the iversity Farm to undergraduate and postgraduate students—The cretary, School of Agriculture, Cambridge (July 17).

Research Fellow in Pure Mathematics—The Registrar, The iversity, Edgbaston, Birmingham (July 17).

Demonstrator (Grade III) in Physiology—The Registrar and cretary, The University, Bristol (July 19).

cientific Officer (honours graduate, and preferably with postduate experience in genetics) at the Plant Breeding Station—e Secretary, National Vegetable Research Station, Wellesbourne, rwick (July 19).

W. T. Henley Fellow (with a good degree in electrical engineering physics) for research work in electrical engineering—The Registrar, een Mary College (University of London), Mile End Road, London, 1 (July 19).

Assistant Lecturer in Geology—The Secretary, Queen's Univery, Belfast (July 20).

Lecturer (Grade II) in Zoology, at University College, Ibadan—e Secretary, Inter-University Council for Higher Education in the onies, 1 Gordon Square, London, W.C.1 (July 21).

Research Zoologist (with an honours degree in zoology), to work the pests of sugar beet—The Secretary, School of Agriculture, mbridge (July 24).

Scientist, Grade III (with a good honours degree in chemistry or ysics), in the Coal Survey Laboratory, Leeds—The National al Board, Establishments (Personnel), Hobart House, Grosvenor ace, London, S.W.1, quoting TT/800 (July 28).

Lecturer in Crystallography in the Department of Geology, cturer in Mathematics, and a Lecturer (preferably with some perience in plant design and operation) in Chemical Engineering, the University of Adelaide—The Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1 delaide, July 30).

Lecturers (with a good honours degree in electrical engineering) Electrical Engineering—Head of the Electrical Engineering partment, City and Guilds College, London, S.W.7 (July 30).

Assistant Lecturer (preferably with a special interest and qualifications in parasitology) in Agricultural Zoology—The Registrar, The University, Leeds (July 31).

Assistant Lecturer (with an honours degree in agricultural chemistry or chemistry) in Agricultural Chemistry—The Registrar, The University, Reading (July 31).

Assistant (with an honours degree in history or archæology, and prepared to take a special interest in prehistoric archæology) in the Hunterian Museum—The Secretary of University Court, The University, Glasgow (July 31)

Chair of Chemistry—The Secretary, The University, Aberdeen (July 31).

Lecturer in Astronomy—The Secretary, The University, Edinburgh (July 31).

Lecturer in the Department of Botany at the University of Natal, Pietermaritzburg, South Africa—The Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1 (South Africa, July 31).

Professor of Geophysics—The Director, Institute of Astronomy, Helwan, Egypt (July 31).

Research Associate (with a good honours degree and some research experience) in the Luminescence Laboratory of the Department of Physics—The Secretary, The University, Birmingham 15 (July 31).

Senior Research Officer (with a university honours degree in fuel technology, or equivalent qualifications, and research experience in fuel technology) in the Coal Research Section, Commonwealth Scientific and Industrial Research Organization, North Ryde, New South Wales, to investigate ash deposition and clinkering phenomena in connexion with the combustion of Australian coals—The Chief Scientific Liaison Officer, Australian Scientific Liaison Office, Africa House, Kingsway, London, W.C.2, quoting 480/107 (July 31).

Lecturer (preferably with special qualifications in plant morphology) in Botany, at the University of New England, Armidale, New South Wales, Australia—The Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1 (Armidale, August 2).

Chair of Pathology and Chair of Bacteriology, at University College, Ibadan, Nigeria—The Secretary, Senate Committee for Higher Education in the Colonies, Senate House, London, W.C.1 (August 3).

Lecturer in Plant Physiology at Auckland University College—The Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1 (Auckland, August 10).

Assistant Lecturers (with a special honours degree in the relevant subject) in Botany, Geology, Physics and Philosophy—The Secretary, Bedford College, Regent's Park, London, N.W.1 (August 27).

Plant Pathologist (with a good degree in botany, including mycology, and preferably with postgraduate research experience or equivalent training in plant pathology or mycology), for research on fungal diseases of hops and fruit—The Secretary, East Malling Research Station, near Maidstone, Kent (September 1).

Anglo-Iranian Oil Company Student for the study of gaseous reactions in the Chemistry Department—The Registrar, Imperial College, London, S.W.7.

Assistant Entomologist, Senior Scientific Officer or Scientific Officer grade, in the Bee Research Department, for work on bee breeding and the pollination of crops—The Secretary, Rothamsted Experimental Station, Harpenden, Herts.

Assistant Experimental Officers (2) (with a pass degree in science, H.N.C., or equivalent qualification) in the Department of Scientific and Industrial Research, Intelligence Division, for abstracting and technical information work—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S.W.1, quoting A118/54A.

Demonstrator in Botany—The Registrar, Wye College (University of London), near Ashford, Kent.

Engineers and Physicists, Senior Scientific Officer and Scientific Officer grades (with an appropriate first- or second-class honours degree, or equivalent high professional attainments) in Royal Naval Scientific Service Experimental Establishments in the London, Portsmouth, Weymouth and Gloucestershire areas, and in Scotland—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S.W.1, quoting A.246/52A.

Head of the Chemistry and Metallurgy Department, Head of the Engineering Department, and Head of the Building Department, at Flintshire Technical College—The Director of Education, County Education Offices, Mold, Flintshire.

Head (with sound practical experience and teaching ability) of the Agricultural and Horticultural Departments, and Farm Manager—The Principal, Studley College, Warwickshire.

Information Officer, Senior Experimental Officer grade (with H.S.C. in science or mathematics, or equivalent) in the Department of Atomic Energy, Risley, to take charge of a Headquarters Library Information Section—The Department of Atomic Energy, Industrial Group Headquarters, Risley, Warrington, quoting 620.

Laboratory Technician (with experience in microscopic work and photography) in the Physiology Department—The Secretary, Rowett Research Institute, Bucksburn, Aberdeenshire.

Officer (with a degree in agriculture or botany, or equivalent) for Oil and Legume Crops, and Assistant Regional Trials Officers (2) (with a degree in botany or agriculture, or equivalent), to conduct trials on plant breeders' materials at a northern and an eastern sub-station—The Secretary, National Institute for Agricultural Botany, Huntingdon Road, Cambridge.

Physicist (with an honours degree in physics) to carry out fundamental investigations into new methods of casting steel by continuous processes—The Personnel Officer, British Iron and Steel Research Association, 11 Park Lane, London, W.1.

Radiochemist, Principal Scientific Officer or Senior Scientific Officer grade (with a first- or second-class honours degree in chemistry, and some years research experience on the analysis and assessment of radioactive substances) for fundamental research work on radioactive materials—The Administrative Officer (Recruitment), Atomic Weapons Research Establishment, Aldermaston, Berkshire, quoting 154/WGH/2.

SENIOR SCIENTIFIC OFFICER (with a first- or second-class honours degree in physics or physical chemistry, or equivalent qualifications, and several years postgraduate experience), to supervise and participate in the activities of a group investigating application of engineering technology to the manufacture of explosive components—The Administrative Officer (Recruitment), Atomic Weapons Research Establishment, Aldermaston, Berkshire, quoting 107/WGB/2.

FINANCIAL CONTROL OF RESEARCH FOR NATIONAL DEFENCE

IN a fourth special report from the Select Committee on Estimates for the session 1953–54 (No. 176. London: H.M.S.O., 6*d.* net) are given the departmental replies to the Committee's seventh report of the session 1952–53 on rearmament. A memorandum by the Treasury, commenting on the recommendation of this latter report that the Treasury should carefully consider the possibility of introducing a system of block grants to certain Ministry of Supply and Admiralty research establishments, at least on an experimental basis, states that the Treasury is unable to accept the recommendation if it implies making block grants to selected establishments to spend entirely at their discretion over a period of years. Such a system, it is urged, apart from other difficulties, would conflict with the fundamental need for the co-ordination of the whole research and development programme for Great Britain, which can only be effected centrally. Taking the proposal to mean that for certain establishments a system of financial programmes should be adopted extending over a number of years in place of the present system of annual estimates, the Treasury points out that, although the long-term financial provision is in principle advantageous, it is nevertheless essential that government expenditure be kept reasonably flexible and subject to regular review in the light of changes in the strategic and economic situation of the country. The irrevocable commitment of defence expenditure for a long period of years, if on any large scale, would be hard to reconcile with this requirement, and this applies to the adoption of a block grant system even if the activities provided for in the grant continue to be subjected to co-ordination and control by the Department.

While the Treasury is obviously concerned with the possibility that the proposal would prejudice such departmental control and also stimulate similar claims elsewhere, the memorandum maintains further that such a system would be contrary to the fundamental requirements of a properly conceived research and development policy. The annual defence research and development programmes, it is pointed out, are carefully built up (and co-ordinated by the Defence Research Policy Committee) under a system of priorities which is designed to ensure so far as practicable that development is in step with defence requirements. Such decisions on priorities can be taken only at the centre, where the complete picture can be seen. Again, in view of the shortage of scientific workers and technicians and the ceiling on Civil Service non-industrial numbers, the allocation from time to time of the available man-power to establishments requires most careful consideration; and the Treasury maintains that this can only be done at the centre, as university graduates are recruited. If, on the other hand, the recommendation may be taken as advocating long-term financial programmes giving stability over a number of years, the Treasury agrees that planning in this way has advantages in the field of research and development, as in others, and it claims that, within the limits necessarily imposed by considerations of Parliamentary control, these advantages have not been overlooked in the formulation of current practice.

While the force of some of the Treasury's argument will readily be admitted, there is little indication that the Treasury appreciates sufficiently the two fundamental points involved—the extent to which effective scientific investigation demands freedom from time control if waste is to be avoided, and the consequences which flow from the interlocking of defence research and civil research at the present time. On the first point, the Select Committee on Estimates, in its third report for the session 1946–47 dealing with expenditure on research and development, commented pointedly that certain weaknesses revealed by its inquiry were due rather to an attitude of mind than to defective organization. It also remarked that the rigid application of a particular administrative code to certain types of research work might cause considerable waste of money and effort and jeopardize the success of a costly project, besides creating an atmosphere alien to the conduct of first-class research; and it suggested that methods of controlling and accounting for expenditure need to be applied with a clear recognition of their implications. A system which produces economies and is eminently sound when applied to normal administrative expenditure may not have the same beneficial results when applied to certain types of research. The nature of the Treasury's reference to the difference between the universities and defence research establishments in the present report indicates a failure to appreciate this fundamental point that the time span for effective control of a research project is determined primarily by the nature of that project and not by administrative considerations.

On the question of the interlocking of defence research and civil research, it is unfortunately true that the impracticability, for security reasons, of making a sharp separation between expenditure incurred essentially for civil purposes and that on defence, makes it almost as difficult as when the Estimates Committee of 1946–47 reported on the possibility of determining whether expenditure on fundamental and applied research is distributed in the best proportions between the main lines of civil and military research. The continued need for security in certain fields, however, makes it the more imperative that there should be no unnecessary secrecy, that the maximum possible information should be given to Parliament, and that no methods of controlling expenditure which are likely to cause waste of scientific effort should be tolerated for administrative reasons. It should be remembered that, as has been recently pointed out in *The Economist*, in counting the high cost of defence to the modern economy, as much as 30 per cent of the nation's research resources, in which first-class men are much scarcer than money, gives a true measure of the long-term cost pre-empted for defence, rather than the 10 per cent of the national income commonly taken as going into defence.

Another memorandum included in this report is by the Ministry of Supply. This relates to the recommendation that every assistance should be given to the Radar Research and Development Establishment and the Telecommunication Research Establishment of the Ministry of Supply and to the Admiralty Signal and Radar Establishment, in order to secure and maintain an adequate staff of scientific workers, so as to preserve the all-important factor of continuity in research. The Ministry of Supply and the Admiralty entirely agree with the Select Committee as to the need for continuity in research, because research provides the only sound basis for future development. They consider that longer-term research should not be crowded out by shorter-term development requirements, or be permitted to fluctuate unduly with every change in financial circumstances. They further agree with the Select Committee that every effort is needed to attract staff of the high quality needed for research at the Establishments, and to this end they are constantly seeking to perfect their relations with the universities; but while staffing difficulties will persist as long as there is a shortage of highly trained electronic scientists, such difficulties are regarded as unlikely to cause a serious break in the continuity of research. The Ministry of Supply and the Admiralty question, however, the wisdom of laying down as a principle that any branch of research and development should be wholly exempt from the effect of financial limitations applying to research and development as a whole. Nevertheless, while not accepting this part of the Select Committee's recommendation, they agree that, because electronics is a young branch of science with great potentialities and because equipment in many other fields is dependent upon it, it deserves a measure of special consideration and protection.

These points are made in connexion with two government establishments for which it may be claimed that special considerations apply. Nevertheless, on the general question, there can be little doubt: research for national defence is for the most part like other forms of scientific research, and the imposition of administrative time-limits on investigations is not in the interest of true economy in the utilization of the limited resources in materials and man-power.

SIR HUMPHRY DAVY

Humphry Davy

'Pilot' of Penzance. By Prof. James Kendall. Pp. 166+7 plates. (London: Faber and Faber, Ltd., 1954.) 10*s*. 6*d*. net.

SIR EDWARD THORPE'S life of Humphry Davy has long been out of print and unobtainable, and so Prof. James Kendall's breezy sketch of the 'Pilot' of Penzance will be welcomed by many readers. Davy is one of the most romantic figures in the history of science—a fascinating human problem—and Prof. Kendall was an ideal choice to write this short life, with his intimate knowledge of the period, his sympathy with Davy and his fresh and lively style. The book is intended, as he says, for the younger generation, and it is in the main a study of Davy's character and personality rather than of his scientific work. Thorpe's shrewd appraisal of Davy's great contributions to chemistry is often quoted, and no doubt the scientific reader will be tempted to read again some of Davy's own papers which stand so well the test of time. The layman will learn from the book much of the significance of Davy's discoveries explained in simple language unembarrassed by technical detail.

There can be few great investigators whose scientific work has been so greatly influenced by the accidents of daily life and by their human qualities. Prof. Kendall tells so well Humphry Davy's romantic story—the country boy with his love of sport that was one of the lasting passions of his life, with the gift of words and the power to hold an audience, self-centred and dreaming of fame. Then came his apprenticeship to a surgeon-apothecary and his reading of Lavoisier's "Chemistry" which awakened so swiftly his native genius for experiment. This and his chance friendships with Gregory Watt and Davies Gilbert led to his appointment by Beddoes at the Pneumatic Institute at Clifton just before his twentieth birthday. There he spent two years in the brilliant and amazingly mature research which so nearly cost "the intrepid investigator" his life when he was breathing various gases to study their effects.

At the age of twenty-three he went to the Royal Institution and was soon to become "the idol of London". Self-taught, free from conventional views, brilliant as an experimenter and observer, Davy had an intuitive sense of the significant and of the wider bearings of his discoveries. Nine years later he was acknowledged as the outstanding chemist of Europe. With his gift of exposition and his infectious enthusiasm he had made science fashionable, and the sequel was his marriage to the wealthy widow, Mrs. Apreece. Prof. Kendall deals feelingly with that marriage, so unfortunate for science, and with the contrast between Davy's warm affection for his sisters and his mother and the coolness that soon arose between him and his ambitious wife, a catcher of 'lions'. Davy's resignation on his marriage of his professorship at the Royal Institution marked the end of his systematic research, though there were brilliant episodes like his discovery of the principle of the safety lamp. It was an uncongenial union, there were faults on both sides and Prof. Kendall is scrupulously fair.

One of his most interesting chapters is the "Retrospect", in which he examines the frailties of Davy's nature in his relations with his brother scientific workers, notably Berzelius, Dalton and Faraday. Davy could be jealous of rivals, being anxious to be the central figure and disliking criticism. He never really forgave Berzelius for his outspoken criticisms of "The Elements of Chemical Philosophy". He had been right when Berzelius had been wrong; but Berzelius was generous in his admiration of "le plus grand chimiste de son siècle". Davy's unfortunate experience with rash speculations in early youth made him wary of hypothesis all his life, and it was a tragedy that he just failed to see the significance of Dalton's atomic theory. As Kendall says, "His near-misses, indeed, are as momentous as his direct hits".

The incidents with Faraday, his "Greatest Discovery", in the years when he was stricken and ill are best forgotten in Faraday's comment to Dumas, standing before Davy's portrait in the Royal Institution: "He was a great man, wasn't he ?"

The interest and charm of the book spring from Prof. Kendall's intimate and affectionate sketch of Davy as a human being. It is full of little touches that show his close acquaintance with the great mass of Davy documents and with the writings and thoughts of his contemporaries. It is the intimacy of the picture that carries conviction and gives a true understanding of a life of genius.

HAROLD HARTLEY

MESON PHYSICS

Meson Physics

By Robert E. Marshak. (International Series in Pure and Applied Physics.) Pp. viii + 378. (London: McGraw-Hill Publishing Co., Ltd., 1952.) 64*s*.

Mesons

A Summary of Experimental Facts. By Alan M. Thorndike. (International Series in Pure and Applied Physics.) Pp. viii + 242. (London: McGraw-Hill Publishing Co., Ltd., 1952.) 47*s*.

THE appearance of these two books is timely, for the past few years have seen great advances in the subject of meson physics. Prof. R. E. Marshak has surveyed the most important results of meson experiments, with particular emphasis on their theoretical significance, and Dr. A. M. Thorndike has undertaken the difficult task of summarizing the experimental facts. Both books are concerned mainly with results obtained since the Second World War and cover work done up to the summer of the year 1952.

In view of the fact that the theoretical side of meson physics is discouraging and the experimental side exciting and stimulating, it might have been expected that Marshak would have found his task difficult and Thorndike relatively easy. The impression gained from reading the two books side by side is just the contrary. Marshak succeeds in marshalling the experimental facts brilliantly, and he skilfully uses just those parts of theoretical meson physics which illumine the experimental results. In so doing, he captures much of the drama of the great enterprise which is modern particle physics. By comparison, Thorndike's treatment of similar facts seems dull and ordinary. The reason for the difference is undoubtedly that Dr. Thorndike is imbued with a sense of fairness to all whose work has contributed in any way to the advancement of the subject. The result is often a detailed description of work long since superseded, and a sense of confusion in the mind of the reader as to what the really important advances in the subject have been. The correct selection of the significant facts and their presentation in a form which gives them proper emphasis is probably the most important function of the writer of a text-book. There are many examples of incorrect emphasis and poor selection in Thorndike's book: limitation of space allows only the following examples. The first is the "λ-meson", a hypothetical particle proposed to account for the unexpectedly large penetration of certain thicknesses of matter by the particles in extensive showers. This hypothesis was abandoned by its principal authors at the Como conference on cosmic rays in 1949. The second concerns the distinction drawn between supposedly different sorts of π-mesons: the "pi-meson" (defined on p. 58 as the "meson producing a pi–mu decay"), and the "π-meson" (defined on p. 58 as the "meson of mass about 280 m_e discovered by Powell"). A similar distinction is made between the "mu-meson" and the "μ-meson".

The first four chapters of Marshak's book are devoted to a discussion of the behaviour of charged and neutral π-mesons at non-relativistic velocities, the special contributions made by experiments on the artificially-produced π-mesons being especially well brought out. The next two chapters deal with the capture and absorption of slow, light mesons and the peculiar properties of the μ-meson in relation to the π-meson. A link is made here between the results from the large accelerators and cosmic rays. There follows a clear presentation of the evidence relating to the nuclear interaction of fast π-mesons and the production of π-mesons. The old topic of plural versus multiple production is then gone into in some detail. Finally, Marshak surveys recent work on the new types of charged and neutral heavy mesons (now termed K-mesons), and V-particles with masses greater than the proton mass (now termed hyperons). This chapter is surprisingly good considering the state of knowledge of these particles when the book was written.

Thorndike's book opens with a discussion of the evidence for the existence of mesons and their properties, followed by good descriptions of the artificial production of mesons and the decay of the various forms of light meson. The book concludes with such topics as the positive excess, the energy spectrum, geomagnetic effects, and cosmic rays at sea-level and high altitudes. Each chapter has a detailed list of references.

The printing and production of both books are well up to the high standard of other books in the same series.
G. D. ROCHESTER

SCIENCE AND THE POTATO

The Potato in Health and Disease

By Dr. Tatham Whitehead, Dr. Thomas P. McIntosh and William M. Findlay. Third edition, revised and enlarged. Pp. xv+744+40 plates. (Edinburgh and London: Oliver and Boyd, Ltd., 1953.) 60s. net.

It is not without significance that more books have been written anent the potato than all the other table vegetables put together. Indeed, I know of no single book in Britain devoted to any other specific staple of our vegetable dietary, always excluding the cereals, other than Oldham's well-known volume on the family of the Brassicae and allied cruciferous crops.

I do not propose to discuss at length the causes which underlie this curious monopoly of interest excited by the potato; but, whatever they be, the three authors of this book have reacted to them with ever-increasing enthusiasm and in almost overpowering volume. I doubt whether they do justice to their own perspicacity when they assess the cause of the potato's universal appeal as being the generosity of its yield, even under the least promising conditions. On such a gross material basis, a parsnip or a turnip could stake a competitive claim. The ascendancy of the potato rests,—like that of bread, on th fact that it satisfies as a food and never cloys a a diet.

The volume under review is no newcomer. It firs appeared under the sole authorship of Dr. T. P McIntosh in 1927 and contained 264 pages. Later Dr. McIntosh was joined by Dr. T. Whitehead an Mr. W. M. Findlay, and together they published i 1945 their well-known book, "The Potato in Healt and Disease", which had by then grown to 400 pages The same trio of authors have now compiled a partl rewritten and greatly enlarged new edition extendin to 744 pages.

Among the new features are chapters on breedin and animal pests, machinery as applied to potat cultivation, and a long dissertation on the relation o viruses to the plants they infect.

As I traversed this rather formidable work, th thought occurred to me more than once—Am reviewing a collection of treatises or an encyclopædia Whatever be the correct answer as conceived by th authors, of one thing I am quite sure: it is no mer text-book which it has been my task to evaluate Conflicting thoughts, such as these, of necessity evok a challenge in the mind of the reader: "To whom have the authors addressed their book?".

An architect who sets out to build a homely villa and ends up by erecting an edifice which from on angle suggests a palace and from another a highl efficient chain-store, must not be surprised if hi efforts evoke a welcome less warm than its individua parts would appear to deserve.

Of one thing I am confident: this work is n student's text-book, and I am no less assured that i is not likely to prove a vade-mecum to the farmer though it may serve the interests of the intelligen specialist cultivator. It will find, however, withou question a place, and a dignified one, in my library and doubtless in that of most senior workers, whethe engaged in research or advisory work. Its hom will be among the reference books, the section o my library which, with advancing years, I mos frequent.

I have intimated that this work suggests a collection of treatises. Let us consider one outstandin example, the description of varieties. Beside innumerable references in the text, the subject i dealt with in an appendix of fifty-three pages. No it so happens that I wrote a book on potato varietie in 1926. It has long been out of date; but th individual descriptions are at least as informin better set out and what is of real importanc accompanied by a short history of origin, and a li of synonyms in each case. How pleased I shoul have been had the authors of the recent work re-edite and improved it, for the student would then have handy volume which he could take with him in th field, needing neither a trailer nor a kindly colleagu to carry and manipulate it.

The writers, naturally alive to the importance o eelworm, have devoted thirty-six pages to its exposition. The chapter is a painstaking piece of wor planned on encyclopædic lines, and as such it is no difficult to point to a few errors of commission an omission. Thus, Ellenby's valuable work has no always been correctly reported; for example, hi hatching inhibitor is not located in the larvæ but i the cyst. His studies on the effect of mustard o hatching were made with mixtures of mustard potato, turnip–potato, etc., and compared wit hatchings in potato excretion alone. Prof. A. F

Todd's hatching factor is eclepic, not ecleptic acid. Of omissions I will refer only to the 1950 publication of the Dutch worker, M. Ootenbrink, which would seem to show that, under strict supervision in regard to both increase and decrease of cysts in the soil, a controlled potato culture can be maintained in infected land. Another 'treatise-like' section is that devoted to virus disease. In the main the data on the relation of virus to plant, and the nature of the virus particle, are derived from F. C. Bawden's book on "Plant Viruses and Virus Diseases", and duly acknowledged. Would it not have been wiser to refer readers to Bawden's well-written book and leave it at that?

The value of the work is greatly enhanced by its good index, and its full bibliography in which there are remarkably few important lapses. It is unfortunate that one of them should be a special favourite of mine, namely, my discovery in 1909 of blight resistance. In conclusion, it can be said that this work gives the reader a just and comprehensive account of the importance of the potato as a subject of scientific inquiry, in which respect it probably has no rival.

R. N. SALAMAN

VALVES AND TELEVISION RECEIVER DESIGN

Data and Circuits of Television Receiver Valves

(Philips' Technical Library; Electronic Valves Series: Book IIIC). By J. Jager. Pp. xi+216.

Television Receiver Design

Monograph 1: I.F. Stages (Book VIIIA). By A. G. W. Uitjens. Pp. x+177.

Television Receiver Design

Monograph 2: Flywheel Synchronization of Saw-Tooth Generators (Book VIIIB). By P. A. Neeteson. Pp. x+156.

(Eindhoven: N. V. Philips' Gloeilampenfabrieken; London: Cleaver-Hume Press, Ltd.; New York: Elsevier Press, Inc., 1953.) 21s. each volume.

THESE three volumes form part of a series on "Electronic Valves" in the Philips' Technical Library. They may also be regarded as companion volumes to the book on "Television" in the same Library (see *Nature*, 172, 471; 1953). Although in the experimental stages of television development conventional radio and amplifying valves were used, the mass-production of television receivers has created a demand for valves specially designed to meet the requirements of the various stages of such receivers.

The first volume gives complete details, with characteristic curves, of the series of television receiving valves developed by the Philips organization during the past two or three years. Considerable technical information is given of the function of each type of valve and of the circuit arrangements in which it can be used. Similar information is given for three types of cathode-ray tubes, or "direct-viewing picture tubes" as they are termed, made for use in television receivers. In later portions of the book, more detailed technical descriptions are given of some special circuit arrangements; and the book concludes with a complete design of a television receiver developed for the reception of vision and sound programmes according to the 625-line standard of the International Radio Consultative Committee (C.C.I.R.) now in use in various European countries.

The second volume deals with the intermediate-frequency stages of a television receiver, bearing in mind that such stages may operate at any frequency between 10 and 100 Mc./s. The book is largely analytical in nature and describes the special problems of design encountered in obtaining response and amplification over a wide band of frequencies, while at the same time the noise-level is kept down to the minimum attainable.

In television reception, the picture is built up by making the electron beam scan the fluorescent screen of the cathode-ray tube. The method of scanning now generally adopted consists of rapid horizontal movements of the beam across the picture, with flyback between the lines at a much higher speed; and then superimposed on these is a much slower vertical movement for the field or picture scan, with again a more rapid fly-back at the end of each field. These scanning movements are controlled by the voltages produced by a saw-toothed generator, the oscillations of which have to be synchronized with the appropriate signals sent out by the transmitter for the purpose. The third volume under notice describes in considerable detail the principles and circuit arrangements of these saw-toothed generators and the application of the so-called 'flywheel synchronization' technique in television receivers. While some portions of the book are of an analytical nature, the mathematics involved is very straightforward and will be easily followed by the prospective designer.

The production of all three volumes is of a high standard, and the engineer and scientist engaged in the design and development of television receiving technique will find them most useful in connexion with their work.

R. L. SMITH-ROSE

LECTURES ON GENERAL PATHOLOGY

Lectures on General Pathology delivered at the Sir William Dunn School of Pathology, University of Oxford

Edited by Sir Howard Florey. Pp. xiii+733. (London: Lloyd-Luke (Medical Books), Ltd., 1954.) 63s. net.

THE subject-matter of this volume has been contributed by no less than ten authors, and like all books written under such conditions it lacks a logical sequence. For example, the chapter on healing occurs some 340 pages after those on inflammation. The work is well written, easy to read for those with some previous knowledge of pathology, and the illustrations are excellent and well chosen. To each chapter is appended a carefully selected bibliography.

The book is a real scientific work and, as such, is a contribution to the subject worthy of the Sir William Dunn School of Pathology, Oxford, from which it has originated. The patient and his diseases, however, have rather been neglected. It sheds light on many controversial problems in general pathology, as each of the authors has freely expressed his opinion as a result of his own experimental work in the field in which he is an expert. Unfortunately, as Sir

Howard Florey states in the preface, the volume does not cover the whole field of general pathology, though the subjects of each lecture have been carefully selected. The value of the book, however, would have been enhanced if some chapters on neoplastic disease could have been included, and it is hoped that in any future edition this omission may be rectified.

A praiseworthy endeavour has been made to give short historical reviews of each of the subjects discussed. At places the review is too condensed and becomes merely a list of names, meaningless to the average student, as, for example, on p. 23, where Ribbert, Senftleben, Councilman, Marchand, Hohnfeldt and Maximow are all mentioned in a single line, only three of these being referred to elsewhere in the text. It is to be regretted in a book where historical accuracy has been the keynote that the primary lung focus (p. 662) should be referred to as the "Gohn focus" when it was originally described by Parrot forty years before Gohn's treatise on the subject appeared. In a volume where so much attention has been given to detail, it would be easy for any reviewer to find points to criticize. In Fig. 24 on p. 97, the fibrous tissue encapsulating an abscess would be better described as granulation tissue. In the chapters on inflammation of mucous membranes, many pages have been devoted to the secretion of mucus; but the all too common catarrhal inflammation of the respiratory tract is dismissed in two short paragraphs. The chapter on degenerative changes is disappointing, and the description of amyloid change and the accompanying plates are particularly poor. On the other hand, the lectures on immunological problems are masterly expositions of the subject, as also are those on inflammation.

This is a book which should be read by every serious student of pathology, in particular those working for higher degrees. Many an older pathologist, too, will derive benefit and may have to sacrifice some of his long-cherished ideas about even the simplest pathological phenomena. It is not a book that can be advised for the average student commencing the study of the subject, as the complexities of an already difficult subject are not made any simpler. In these days of overcrowded curricula in medical schools, the student has to acquire his knowledge quickly and easily, and it would be difficult for him to do so from the present volume.

John W. S. Blacklock

SPIDERS OF BRITAIN

British Spiders

Vol. 2. By G. H. Locket and A. F. Millidge. Pp. vii+449. (London: Ray Society, 1953.) 30*s*.

THIS volume completes the survey of the spiders of the British Isles, begun by the authors, G. H. Locket and A. F. Millidge, several years ago, so that now for the first time since John Blackwall's historic folios of 1861–63 (also Ray Society publications) a guide to all the native species is generally accessible. The congratulations which were offered when the first volume was reviewed (*Nature*, 168, 714; 1951) may here be unhesitatingly repeated.

The arrangement of the descriptive matter follows exactly the plan of the earlier part of the work, and therefore shows the same combination of clearness and conciseness with practical helpfulness that was so conspicuous there. In brief, when the identifying of a species is easy, the authors waste neither time nor space; when it is difficult, fuller treatment and comparative tables come to the reader's aid. The illustrative drawings, which are the work of both are remarkable for their uniform clarity. They are well reproduced and are, perhaps, one of the outstanding features of the book.

This second volume, which is larger than its predecessor, describes seven families and 369 species There are, again, illustrations of the genitalia of both sexes of every species, accompanied by such othe diagrams and dichotomic keys as are necessary. The distribution of all species is also given—broadly in geographical, and more precisely in ecological terms.

Among the seven families described are the Agelenidae, which includes the ordinary spiders to be found in dwelling-houses, and the Argiopidae, which are familiar because they spin orb-webs. These pages will interest any reader; but the serious student i likely to turn first to the treatment of the Linyphiidae —the dominant British family of 245 of the smalles spiders in the land. He will find a most impressive key to the one hundred genera by which the family is represented in the British Isles; and although it composer, Dr. Millidge, writes of it with modes reference to its fallibility, it is at the same time true that never before has the captor of a Linyphiid been able to turn to so complete and authoritative a guide as is published here. Only those who have tried to steer a course through the complexities of this family can fully appreciate the nature of Dr. Millidge's very considerable achievement.

Two other points should be mentioned. One is a valuable practical hint—the fact that an obscure epigyne can be made more distinct by soaking the specimen in phenol containing 10 per cent of alcohol The second is the fact that the book ends with a check list of the 581 species and subspecies recognized as British. It is interesting to compare this number with the 566 recorded by Dr. W. S. Bristowe as lately as 1939; and if it may be added that the authors have in their collections several species even more recently found, it is seen that the day of complete knowledge of the British spider fauna is not yet. It is, in fact most significant to notice how high is the proportion of species described as 'rare' or 'very rare', or fo which but one locality is known, or but a few captures have been reported.

It is permissible to glance at the impression made by the two volumes together and to appraise the work as a whole. It is seen to be a first-rate piece of systematic, descriptive writing, which brings the task of naming a spider within the capacity of any careful naturalist. This is a state of affairs which has neve existed in Britain until now; and the beginner, the general naturalist or the ecologist is far less dependent on the personal help of the expert than he was. I this view of the position is correct, then the appearance of this work is an event of great importance.

Yet it would be wrong to regard the publication of the book as the end of a phase in British arachnology. It is rather the beginning of a period in which we may expect a rise in the number of those who take a permanent interest in spiders, and a long overdue increase in the attention paid them by professional zoologists. There are few animals more worthy of study, and a growth in active arachnology would be the reward, apt and appreciated, which th authors so amply deserve.

T. H. Savory

SOME CONCEPTS OF ETHOLOGY

By Dr. W. H. THORPE, F.R.S.

Jesus College, Cambridge, and University Department of Zoology

ETHOLOGY is a convenient word to denote behaviour study in the widest sense, and if used in this way ecology, ethology, bionomics and axonomy can be regarded as the four divisions which ogether comprise the study of the whole living animal as distinct from anatomy, physiology, embryology and genetics (with all their included subdivisions such as histology, cytology, biochemistry, etc.), which constitute the study of its parts and of its development. The term ethology has recently come into much more general use than before as a result of new theories primarily concerning instinct, which are due in the first place to the work and writing of Konrad Lorenz[1-3]; but it would be a great mistake to confine its use solely to the work of those who are known to base their studies on any particular theoretical scheme, whether of Lorenz or another. The word is potentially much too useful to be restricted in this way. Nevertheless, wide as the eal meaning of the term is, there is little doubt that the present popularity of behaviour study is in fact largely due to the stimulating and clarifying effect of Lorenz's theories; and it is interesting to consider how some of the essential concepts in this field have fared during the fifteen years or so since[1-3] his scheme was first put forward in its definitive form.

The essential elements of Lorenz's formulation are as follows:

(1) The division of behaviour into a flexible appetitive behaviour and the relatively rigid consummatory act.

(2) The assumption that the fixed action pattern of the latter is generating some specific action potential (a term which now includes the essentials of the original action specific energy concept of Lorenz and in effect supersedes it). This brings back in a new form the concept of internal drive, o resuscitating the essential idea of instinct.

(3) The concept of the 'innate releasing mechanism' which assumes there to be within the central nervous ystem a series of mechanisms of a particular type which effectively inhibit or block all discharge of activity unless the animal encounters the right nvironmental situation or stimulus to remove or elease the block.

These and other considerations led almost invitably to the hierarchy scheme of Tinbergen[4], ccording to which there are a number of tiers or evels within the total organization which makes p an 'instinct', and incorporated in each level re one or more innate releasing mechanisms. On the receptor side these are in some way attuned to the biologically right stimuli or situations in the environment—as, for example, the appearance of the exual partner or the specific prey—and are, as it were, unlocked by the appropriate environmental eleasers and only by them, thus allowing behaviour o proceed to the levels below, only in the biologically right situation. These lower levels in their turn incorporate blocks which, while they remain unmoved, prevent action of these lower centres proceeding. So long as such lower centres remain blocked the action potential will therefore be diverted into the type of action known as appetitive behaviour, which is 'directive' in that it tends to bring the animal into the kind of environment where the appropriate releaser is likely to be encountered.

Finally, to make clear that this scheme is not one of innate or inborn behaviour only, it should be mentioned that although Lorenz regarded the learning abilities of animals as mainly operative in the sphere of appetitive behaviour, his theory is by no means an anti-learning one; indeed, besides accepting the categories of learning already usually assumed, he found it necessary to propose a new one—imprinting—to effect, in certain special cases only, the required rapid adjustment between the simplified or skeleton organization which constitutes the releaser and its correlate, innate releasing mechanism, and the more elaborate or detailed pattern to which the individual animal has to respond.

The immediate attractiveness of this scheme lay first in its apparent avoidance of the vitalistic approach—for the objective of the animal is no longer the attainment of the final biological goal or result (which it is, of course, inconceivable in most cases that it could know about) but rather the performance of the rigid consummatory acts themselves. Besides thus providing a physiologically reasonable system in place of an obviously untenable vitalistic one, this system at once showed some other tremendous advantages. In particular, it stressed the fact that evolutionary relationships are often expressed even more clearly by similarities and differences in behaviour than they are by structures and morphological characteristics, and so the theory provides an excellent approach to the taxonomic analysis of behaviour. Moreover, the very fact that these behaviour patterns are so constant as to be taxonomically valuable makes it inconceivable, at least in so far as the invertebrates and the majority of the non-mammalian vertebrate groups are concerned, that learning can be playing a significant part in their production. It seems apparent that within the insects, for example, countless thousands of instances of specific behaviour (such as acts related to pupation which are performed only once in the life of the individual) cannot possibly be the sole expression of anything that can by any conceivable definition be called learning. Nor, to take another example, is there evidence that the olfactory selection of hosts by hymenopterous parasites or other insects is primarily learned. On the contrary, in *Nemeritis* Thorpe and Jones[5] (misquoted by Lehrman[6] to give the exact opposite of the true meaning) found the choice to be preponderatingly inborn and only to a relatively minor degree modified by learning.

Finally, Lorenz's idea of internal drive held back by the block or inhibitory action of the innate releasing mechanism system until the right releaser is encountered at once attracts the field naturalist and especially the field ornithologist, for it supplies a ready explanation for a vast amount of puzzling behaviour—displacement and vacuum activity—which it seems otherwise extremely difficult, if not impossible, to interpret.

It appears that the most fundamental concepts at the base of these theories of animal behaviour are centred around the idea of internal drive ; but before discussing this central problem it will perhaps be as well to consider one or two of the criticisms which have recently been directed against these current theories of instinct.

First, it has been objected that there is an unwarranted dualism in instinct theory. Thus Kennedy[7] in effect says that all behaviour is, in fact, reflex and that all evidence for any internal drive is spurious. He argues that the current objection to the universal employment of the term reflex among behaviour students is due to the fact that they have an out-of-date picture of reflex which is "a wooden caricature of reality". But he himself clings to its use because he regards it as the sole behaviour concept which embodies the principle of determinism—which, if it means anything, is tantamount to saying that it is rigid. The whole matter is, in fact, a quibble. If the term reflex is regarded as implying relative or absolute rigidity, then it is still useful to behaviour students (as it is to physiologists) in certain restricted contexts. If, on the other hand, it simply means 'response'—then it is better to say so and to drop the term reflex. It is significant that Pavlov[8], who did in fact widen the use of the term so that it became practically meaningless, nevertheless handicapped his followers by his retention of it and by his contention that instincts are "nothing but" reflexes. He urged (as Kennedy says) that the investigation of instincts is the "next important task", but none of his followers heeded this. The reason is not far to seek : the idea of the reflex did not alone provide them with the concepts necessary for the work, and it was, as I think all critics admit, the coming of Lorenz's formulation which was the signal for the great modern development of analytical work on instinct. This was not so much because the ideas contained in it were new—actually none of them was entirely new—but it was rather because here was a new system which facilitated and invited experiment and, by the way in which it is articulated, directed attention to those points in the vast and varied phenomena of instinct where experimental analysis was both profitable and immediately practicable. It has also been argued[6] that present-day instinct theory often blinds those who use it to the evidences of adjustment by learning which their animals display. It may indeed be possible to point out occasional relevant instances of animal learning which some modern workers on instinct have missed because of their concentration on the latter field ; though it would also be possible to point to examples where such theories have actually inspired research on learning. But it would be far easier to name scores of workers who have missed the whole field of instinctive behaviour because of their obsession with the learning process. It is largely because of this that the work of those modern schools of comparative psychology which are based exclusively on the theory and investigation of learning is only too often virtually useless to the zoologist, and it is the failure of such schools which has thrown into relief the immediate relevance for the naturalist of so much of modern instinct theory. To say either "all behaviour is learned" (as Hebb[9] or Lehrman[6] appear in effect to do) or "all behaviour is reflex" is at the present time as stultifying for research as it would be to say that all behaviour is innate. It may, of course, be possible so to extend the definition of the terms 'reflex', 'learned' and 'innate' in such a manner that such statements are virtually true ; but when this i done the terms themselves thereupon become practically useless, for such statements give a spuriou simplicity and uniformity to what is, in fact, highly complex.

Kennedy argues that it is for social reasons tha the dualistic approach which he finds so reprehensibl has lingered in biology, psychology and philosophy long after it was abandoned in physics and chemistry To me it appears to be rather for epistemologica reasons : and may it not be that dualism is stil necessary in biology simply because living organism are different from non-living ones ? Directiveness o purposiveness, whatever anyone may say, is characteristic of living systems ; and Sommerhoff[10] ha recently made a brilliant and courageous, although consider ultimately unsuccessful, attempt to expres the essential directiveness of organisms in purely physical terms. Until this has been done convincingly and without any room for doubt, there is no justification for denying the place of dualism in biology

Lehrman[6] takes objection to a number of idea which he claims workers upon instinct hold, but som at least of these objections appear to be due to misunderstanding. He himself apparently starts ou with the idea that all behaviour must be learned— conclusion surely only possible to one who has confined his studies to certain very special cases amon mammals, and difficult to maintain even then Moreover, he finds difficulty in accepting the abundant evidence that complex behaviour patterns ar inherited because he is unwarrantably thinkin of such inheritance as involving some sort of preformationist doctrine of the instinct being itsel within the germ plasm. This would indeed be a unjustifiable reification ; but I am not aware of any ethologist ever having implied any such thing. Wha modern instinct theorists mean when they speak of motor pattern or an innate releasing mechanism bein inherited or inborn is that it is genetically 'coded' an so determined in the sense that the behaviour is constant, even though the environment may be relativel inconstant and may contain no stimulus adequate fo the determination itself. They do not mean, and neve have meant, any such absurdity as the statemen that "the organism is independent of its environment". On the other hand, Lehrman seems to oppos reification where it is not only useful but eve necessary. Crude isomorphism is rightly suspect : w need not, for example, suppose that the engram of cube is itself cubic. But his objections would seem t lead to the rejection—as unjustifiable reification an isomorphic preconception—of the basic assumption of neurophysiology that there is to be expecte within the central nervous system a system o organization sufficiently similar in certain essentia relations to the observed behaviour to be able t serve as a code ; and this is all that instinct theor need imply. It is exactly in this sense and i this sense only that the behaviour of embryon tissues and their constituents (such as blastomere histoblasts and the cells of imaginal buds), where th problem of organization is presented most vividly may be said to be inherited. Lehrman thus appear essentially antiphysiological, although utterin appeals for more physiology. The term innate, however, is admittedly liable to cause confusion in tha it incorporates three different strands of meaning (1) internally co-ordinated, (2) inborn, and (3) drive from within. The first applies to practically a behaviour ; (2) may apply equally to instinct an reflex, while (3) appears to be especially characteristic of instinct.

This brings us to the problem of drive and consummatory act, which must be considered more fully since it is in many ways central to the whole subject. Tolerably objective definitions of these two terms have been given as a result of an international conference[11] at which a number of behaviour students representing the most varied aspects and methods of approach to behaviour study were present; but critics are apt rather conveniently to overlook this admittedly provisional attempt of ethologists to be as objective as possible. We may therefore give three of these definitions here:

Drive—the complex of internal and external states and stimuli leading to a given behaviour.

Appetitive behaviour—the variable introductory phase of an instinctive behaviour pattern or sequence.

Consummatory act—an act which constitutes the termination of a given instinctive behaviour pattern or sequence.

The term 'drive' in its earliest usage in behaviour literature probably meant little, if anything, more than a state of internal activity or disequilibrium of the central nervous system or of internal organs in their turn stimulating the nervous system. So long as the meaning was itself restricted it was unobjectionable enough even to the avowed opponent of 'instinct'. So early as 1911, however, Ladd and Woodworth[12] were using the term to cover the mechanism by which activity was internally governed and directed along certain channels, and so no sooner had the term 'instinct' been abandoned by psychologists and behaviourists than we find 'drive' taking its place and standing for just those ideas which had led to the rejection of the former term. Later Woodworth[13] pointed out that habit mechanisms, in any event in human beings, may become drives and implied that since, in his view and that of many earlier writers, habit and instinct had much in common, the co-ordinating mechanism of the behaviour pattern itself might be generating the drive.

In the late 'thirties, Lashley[14] and Lorenz[1–3] realized independently that the aspect of instinct which would be most profitable for study was not specifically the drive itself, central though that idea is to the whole field, but rather the internal system of co-ordination of special behaviour patterns on one hand and the special receptive sensory mechanisms on the other. In fact they concentrated their attention on the whole specific sensori-motor organization of the behaviour patterns, considering the complex and stereotyped action system to be more fundamental to the subject than any immediate question of drive; and both these workers proposed that a study of these mechanisms themselves might throw light on the problems of drive and motivation. Lashley in effect suggests that all cases of motivation might well turn out to be the result of the activities of specific co-ordination mechanisms and that general drive is really nothing more nor less than the partial excitation of a very specific sensori-motor mechanism irradiating to affect other systems of reaction. We thus arrive at something very like the concept of specific action potential which, in the form of action specific energy, was to play such an important part in Lorenz's system. Lashley's ideas, penetrating though they were, perhaps aimed at little more than supplying some general directions for future experiments and theorizing, whereas Lorenz's contribution was to produce a thoroughgoing theoretical system of behaviour more comprehensive than any which had preceded it.

The idea of a relatively rigid consummatory act is thus a theoretically fundamental one, and it brings with it the methodologically invaluable distinction, which had in fact been made years before by Sherrington[15], between appetitive behaviour and consummatory act (pre-current and consummatory responses, as Sherrington called them). While this separation into two categories probably continues to be as useful as it has ever been, it has now become abundantly clear that the distinction is not a hard and fast one. Much appetitive behaviour contains consummatory acts of what might be termed the minor grade, and the work of Hinde[16] (to whom I am indebted for much useful discussion of such problems) on the behaviour of the great tit (*Parus major*) and that of Hinde, Thorpe and Vince[17] on the following responses of young moorhens (*Gallinula chloropus*) show quite conclusively that in these cases appetitive behaviour and consummatory act vary in degree of rigidity and flexibility; no absolute distinction can be made between them. Both are to some extent spontaneous in that they show evidence of internal activation, both are stereotyped to some degree and show some rigidity, and both are to some extent flexible. Thus the classic examples of appetitive behaviour and consummatory act can be regarded as the two ends of a series, ranging from extreme variability and plasticity on one hand to almost complete fixity on the other. Moreover, much appetitive behaviour consists in a process of searching which can be described as locomotion with a particular orientation. Since it may often happen that the conclusion of the appetitive behaviour is the finding of a particular object or attainment of a particular situation (that is, a particular perceptual set) and not necessarily the performance of a particular act, so similarly it is sometimes a perceptual set or locomotion with a particular orientation thereto which turns out to be consummatory. So we can be fairly clear that not all drive arises from the co-ordination mechanism of a specific consummatory act. Moreover, since many consummatory situations or perceptual sets are extremely general, some drive at least must also be generalized, suggesting as in the system of Tinbergen[4] an effect coming from higher centres; these higher centres being, according to much evidence, the ones most closely and directly linked in activity with levels of hormone production; and so once more we seem to be approaching the concept of some entity flowing down pre-formed channels. Although, of course, for the sake of simplicity the organization of the appetitive behaviour is entirely omitted from Tinbergen's scheme, so that the hypothetical channels are only shown as leading from the appetitive behaviour to the consummatory act, there is no doubt that appetitive behaviour is no less complex than the latter, and that if such pathways are present in the one they must also be present in the other. Consummatory situations are clearly demonstrated if we analyse carefully the process of, say, the building of a complex domed nest by a bird such as the long-tailed tit (*Aegithalos caudatus*). Here we cannot escape the conclusion that in addition to an elaborate series of releasers (probably most of them visual patterns) which determine the way in which the various individually rather simple building actions are employed to construct the nest, there are other situations which are themselves consummatory. They may well be thought of as specific 'inhibitors' activating what might be called 'innate inhibiting mechanisms', in that they bring to an end a particular series of actions which result in a particular part of the nest construction, but do not necessarily themselves initiate the next stage in behaviour. So here, too, we see that the goal of such sections of behaviour is not the consummatory act by itself, but at least as much the experience of having constructed a particular object, or having achieved a particular situation. Bastock, Morris and Moynihan[18] have also pointed this out with reference to both birds and fish.

In view, then, of these conclusions, what can we think about the origin of the drive in such situations? Since it is not related to a particular act or act sequence, it cannot properly be regarded as arising from the co-ordination mechanism of that act. Again, if we look at the recent literature on behaviour we are continually being confronted with the terms aggressive drive, fighting drive, fleeing drive, etc. Here again in many cases we cannot find a specific consummatory act which is sufficient by itself to complete the behaviour sequence. In aggression, the pattern of attack or of fighting may, it is true, be a consummatory act in a sense, but it is often a pattern which can be used in a number of different situations, and it only becomes consummatory for a certain piece of behaviour when it takes place in a certain situation. So here again it is a situation which is consummatory at least as much as the act. When we consider the fleeing drive the position is even more clear, as was seen by Wallace Craig[19] in his discussion of aversions; it is very doubtful in many cases whether there is a specific consummatory act terminating a fleeing drive. In such situations, as, for example, in bird behaviour, the act of recognizing a rival fellow member of the species, of expressing antagonism or dominance to it or of fleeing from it, must all in part be consummatory, although they do not in by any means all cases lead to a particular act, and it becomes difficult to describe the actual situation except in terms involving the self and another member of the species recognized in relation to the self. The outcome of these considerations is that in order for there to be any flexible working towards a goal situation of whatever kind, there must be some schema of the act and the releasing situation together, as, for example[20], the learning of song by a chaffinch (*Fringilla coelebs*), where the 'goal' seems to be a descending series of notes of 2·5 sec. duration of a certain degree but quite unspecified kind of complexity. This schema, inborn or learned, but usually a combination of both, appears to be generating 'potential'. Hayes, Russell *et al.*[21,22] see this clearly and they suggest, purely for purposes of illustration, that if we were able to introspect an innate releasing mechanism while its output was still below the release level, we should be aware of a goal. For a specific drive ('act-available-message-set' in the information theory terminology of these authors) the schema must be relatively precise, while for a superordinated drive ('animal-available-message-set') coming from a 'higher' region of the hierarchy system it must be far more general.

But whether the climax of the behaviour is a specific or a general situation, the concept of appetitive behaviour is crucial for the problem of drive. Where it is relatively stereotyped and consists of random or unoriented locomotion, as in klinokinesis, it raises few difficulties. But where it is more variable and has to be precisely directed or oriented, some important problems arise. In order to account for the flexible directiveness which is the most characteristic feature of appetitive behaviour—that is, in order to account for the appearance of purpose displayed—there are two possible alternatives. One can assume a very great variety and complexity of pre-formed pathways, each of which is as a result of evolutionary selection, directive in the sense that all well-designed machines are directive, and which serve as possible alternatives. Certain of these would then come to be preferred by a trial-and-error process as a result of reinforcement by the attainment of a releasing situation and the ensuing consummatory act. Besides this, one can suppose a 'directiveness' of a more subtle kind in the sense that progressive approximations to the 'ideal' releasers are perceived and so reinforced, with the result that the animal, by means of a real but extremely short-term purposiveness and anticipation, succeeds in steadily sharpening the configuration of the innate releasing mechanism. Thus by gradually building up its own releasers, the appetitive behaviour as a whole becomes, in effect, welded into a directional unit which gives an overall impression of purpose much greater than the apparent sum total of the minute gleams of purposiveness which are supposed to have played their part in its development in the individual.

It is evident that the first alternative must be very widely operative in animal behaviour. The question is how far is the second concept necessary. It seems that to account adequately for all varieties of appetitive behaviour it is necessary to assume that not only are the fixed action pattern and the inhibitory mechanism by a feed-back device together generating some motivation for the next phase, but that also some short-term purpose in the superordinated drive itself must be postulated. The concept of appetitive drive as nothing more than a completely non-directive 'force' rigidly confined within a previously co-ordinated system of conduits together with the specific action potential of a consummatory act seems inadequate to cover the great variety of behaviour observable. Many biologists will no doubt object to the introduction of such a concept as purpose into their subject and, of course, there are great fields of biology in which, however directive the organization and activities may appear, the concept of purpose is either definitely redundant or, to say the least, is of doubtful utility. Sommerhoff tries to solve the problem by separating 'purpose' (as subjective adaptation) from 'purposiveness' (as objective adaptation) and claims that his system of directive correlation is all that is necessary for the objective description of purposiveness in living organisms. But here he seems to fail; for, as Scriven[23] shows, on Sommerhoff's analysis some machines would be classed as living beings and some living organisms (including some human beings) would be classified as nothing more than machines. So we still lack a satisfactory set of terms and concepts which will serve for the description of all examples of directively correlated animal behaviour and thus we still require the concept of purpose. In using such a term we, as biologists, need not, of course, come to any conclusion as to the relation between mechanism and mental events. If we decide, as the result of experiment, that the behaviour of an animal gives reasonable evidence of purpose as distinct from directiveness, we mean that its behaviour cannot be fully or reasonably explained by mechanisms at present known to be operating within the body of the animal—although if we can point to a sufficient mechanism, that does not necessarily mean that true purpose is absent. As Agar[24] says, it is the task of biologists to investigate such mechanisms down to the most minute detail; but while the assumption and investigation of mechanisms is an essential method of biology, it is hard to conceive as a really fundamental explanatory principle in a biological philosophy. On the other hand, as Woodger[25] has indicated, it is doubtful whether the causal efficacy of purpose can be proved in the sense that all other explanations are excluded. "It is always possible to defend microscopic mechanisms in principle . . . by making your mechanism complicated enough and by postulating enough sub-mechanisms to meet all contingencies. It cannot then be refuted, but neither can it be verified."

But, purpose apart, Kennedy has objected to the ethologists' use of many other much more orthodox terms which he regards as subjective. He ignores the definitions above referred to, and appears to argue that the use of many of these terms is inadmissible in that in employing them ethologists have abandoned all pretence of being objective and are back in the jungles of subjectivistic animal psychology. Tinbergen does indeed claim that the particular value of his system is that it is objective, and in this he is undoubtedly right. When compared with much of the naturalistic comparative psychology which was not infrequently met with prior to the publication of Lorenz's main papers, its objectivity is plain and is certainly an inestimable advantage. But there is a danger lest objectivity come to be thought of as the sole requirement of a system of behaviour study. Of course, although all concepts are ultimately subjective in origin, it is usually possible to restate them in more or less objective terms and thus to clothe them with whatever degree of respectability may be required by the climate of scientific opinion at the moment. Actually, to me, the great merit of the behaviour theory of Lorenz—for much of the development of which Tinbergen is responsible—is that, in fact, as the writings of both these authors show, it combines both objectivity and subjectivity and (in the first place by distinguishing flexible and inflexible behaviour) helps one to specify where each has its rightful place and each its dangers. Sommerhoff's failure in his main task shows in, I think, a particularly dramatic fashion that both subjectivity and objectivity are necessary in the scientific study of life and that a biology which succeeds in being purely objective (however successful it may be in parts of its field) must fail to provide a full biological philosophy—just as surely as a purely subjective biology must, of course, fail. In other words, subjective concepts derived from introspection are among the essential tools for the study of life, and the only hope for a complete biology is to combine subjective and objective in the right proportions, using each approach with due circumspection and adequate safeguards, as it is required. All our concepts, in whatever field, are of course in the last resort subjective in that they are the conscious expressions of our own experiences. Although, as stated above, there are wide fields of biology where it is possible, and indeed essential, to achieve a very high degree of objectivity, there are many sections of ethology concerned with the modifiable behaviour of the higher animals where we sometimes simply cannot progress without concepts of a high degree of subjectivity. Polanyi[26] has said that science does not require that, in the study of man and society, we attempt always to remain detached observers; "On the contrary, the part played by personal knowledge in science suggests that the science of man should rely on greatly extended use of personal knowing". I would add that the same applies to certain fields of biology other than those which deal exclusively with man. But we have above all to beware of falling into the trap—which has so frequently caused the downfall of past students of living matter—of supposing ourselves objective when, in fact, we are being subjective. First and all the time we must know precisely where and to what extent we are using and relying upon subjective concepts. It is essential to avoid confusion here if biology is to deal adequately with the vast theoretical problems that confront it.

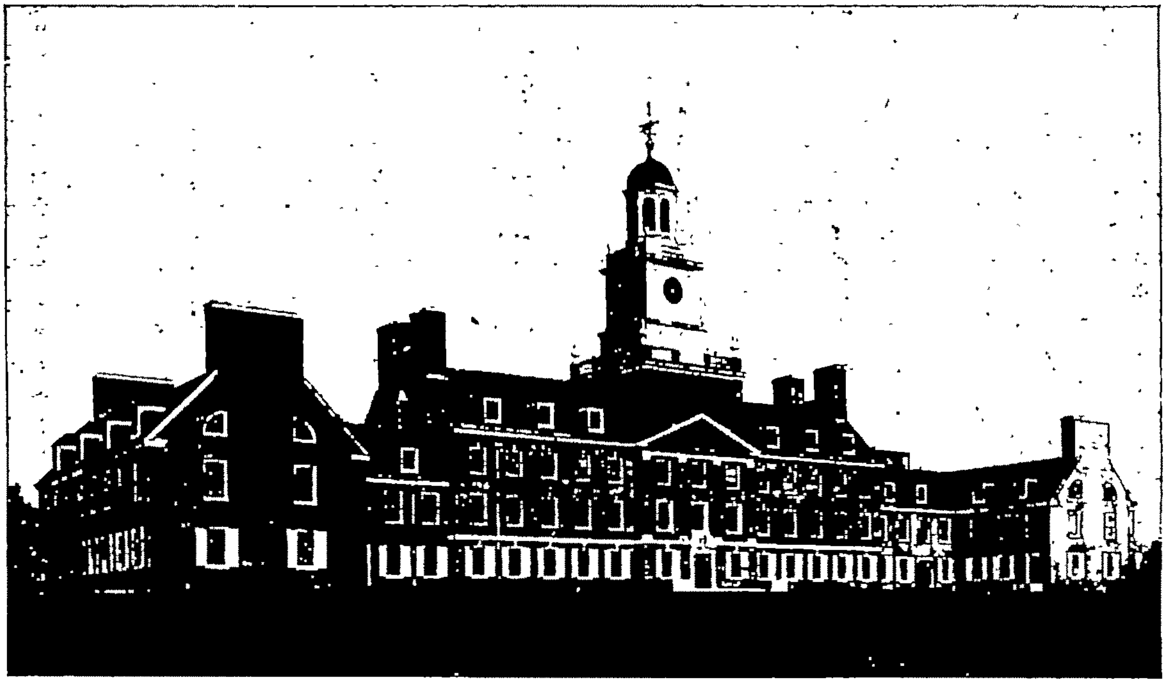
INSTITUTE OF MICROBIOLOGY, RUTGERS UNIVERSITY

THE newly completed building of the Institute of Microbiology of Rutgers University, New Brunswick, the State University of New Jersey, was officially opened on June 7, addresses being given by Dr. A. J. Kluyver, of the Technical University, Delft, President L. W. Jones, of Rutgers, and Dr. Selman A. Waksman, director of the Institute. Following the opening ceremony, a two-day symposium on "Perspectives and Horizons in Microbiology" was held.

Rutgers University is the eighth oldest Colonial college in the United States; it was given a charter as Queen's College in 1766 by King George III, and the Institute of Microbiology is one of its newest divisions, the decision to create the Institute having been taken by the trustees of the University in 1949. Dr. Waksman and his colleagues of the Department of Microbiology of the University's College of Agriculture have discovered a number of antibiotics, the



Institute of Microbiology, Rutgers University

most notable being streptomycin, for which Dr. Waksman gained the Nobel Prize in Physiology and Medicine for 1952, and the establishment of the Institute is a direct result of the royalties paid by manufacturers of streptomycin to the Rutgers Research and Endowment Foundation. The Foundation decided to dedicate these royalties to microbiology, and the Institute will be devoted primarily to research in the various fields of microbiology, which will be treated as a fundamental science, although certain practical applications will not be overlooked. The staff of the Institute will investigate micro-organisms from the point of view of occurrence and classification, cytology and genetics, physiology and biochemistry; it will also probe the relationship between microbes and higher forms of life, including man, his domesticated animals and plants. Concomitant with these basic studies, other divisions of the Institute will examine some of the practical applications, such as production of antibiotics, vitamins and enzymes, and some of the fermentation processes.

In view of the necessity of training a large number of microbiological investigators, the staff will also carry out a certain amount of advanced-level teaching, instruction being given to about twenty-five graduate students and several post-doctoral Fellows. It is hoped that the Institute will serve as a gathering place for seminars and conferences on microbiological subjects as well as a depository for microbiological cultures of theoretical or practical importance. It will collaborate with government, medical and industrial agencies in the development of important projects in the field.

The Institute is on the new University Heights campus at present being developed as the science centre of the University, and is situated on a slight rise in the ground overlooking the University golf course. Following a traditional pattern, the new edifice adheres to the Georgian Colonial architecture that dominates many of the University's buildings, being a four-story red-brick building, flanked by two wings, 82 ft. deep by 42 ft. wide, the whole enclosing a central area approximately 150 ft. long by 50 ft. deep. The overall length of the building is 302 ft. The central part of the first and second floors contains teaching and research laboratories and is constructed of removable metal partitions. The laboratory area for the most part is divided into units 10 ft. wide, so that laboratories of any desired width in units of 10 ft. can be established. The central area on the first floor will be devoted to teaching and to graduate student research. It includes a large and a small teaching laboratory, classrooms, a microbiological museum and several research laboratories. The lecture hall seats two hundred persons and is in the right wing of the first floor.

The centre and right wing of the second floor is the principal area of research occupied by the research staff of the Institute. In most instances, offices for the scientists are connected to the laboratories. In addition to the research laboratories, this area includes a number of special instrument rooms, warm rooms, sterile rooms, cold rooms, a radioisotope room, a photography suite, a sterilizing and washing room and solvent extraction rooms. The right wing over the lecture hall is devoted to animal experimentation and contains four temperature-controlled animal rooms, an autopsy room, a sterile room, an instrument room and an incinerator room.

Approximately half the left wing is devoted to the pilot plant, where fermentation processes can be carried out on a large scale. It contains a number of fermenters ranging in size from one to three hundred gallons, and it is two and a half stories high. The remainder of the left wing is given over to a solvent extraction room, a maintenance shop and storage rooms. The library reading room, seminar rooms and administration offices are on the third floor. There is room for approximately seven thousand volumes in the library, the stacking area being immediately above the reading room. The fourth floor is used for a conference room, dining room and kitchen. The total cost of the building was approximately 3,050,000 dollars. The equipment is valued at approximately 150,000 dollars.

The Institute is a co-ordinate division of the University, and as director Dr. Waksman is responsible solely to the President and Trustees of the University. The staff includes the following: *Associate Professors*, Dr. V. Groupe (virologist), Dr. W. J. Nickerson (physiologist) and Dr. Ruth E. Gordon (taxonomist); *Assistant Professors*, Dr. H. Lechevalier (microbiologist) and Dr. Waclaw Szybalski (geneticist); and six investigators holding the rank of instructor. In addition to the director, the administrative staff has provision for a vice-director, who has not yet been selected, an executive secretary, an editor-librarian and six secretaries. The technical staff includes several research associates and assistants, and twelve to fifteen laboratory, technical and maintenance workers.

DEDICATION OF THE LABORATORY OF OCEANOGRAPHY, WOODS HOLE

THE new Laboratory of Oceanography at Woods Hole, described in *Nature* of May 29, was opened ceremonially on June 21 by Rear Admiral F. R. Furth, U.S.N., Chief of Naval Research. He said that although most of what the Navy requires from oceanography is too specialized to have much effect on the development of the subject, it is their intention to support oceanographic research in such a way that military requirements would do as little as possible to hinder its systematic progress. Admiral Furth's speech, and that of the Assistant Secretary of the Navy, James H. Smith, who is responsible for research, showed that the U.S. Navy, having demanded such a large share of the potential of the Woods Hole Oceanographic Institution during the War, and now finding itself unable to relinquish its claim, is adding an associated Laboratory of Oceanography large enough to allow the Institution and its work to regain much of its former academic character: there will again be space and facilities for more systematic study of outstanding basic problems and opportunities for visiting scientists.

The Navy speakers emphasized that a greater understanding of the physical processes in the oceans is essential to the solution of some problems bearing on amphibious, surface and submarine warfare, and for the best use of weapons, instruments and methods employed at sea. They regarded the opening of the new laboratory as a major landmark in the Navy's continuing oceanographic programme.

Dr. Detlev W. Bronk, president of the U.S. National Academy of Sciences, stressed the "spiritual value of the oceans which arouse yearning to see and to know". He showed that the action of the Navy Secretary, Gideon Welles, in 1863, in creating a commission on research, had indirectly fostered the National Academy, and that the Office of Naval Research, which is responsible for the new Laboratory of Oceanography, is a lineal descendant of the commission. He maintained that oceanography gives useful emphasis to the unity of all sciences, and that it does much to encourage international unity and amity. The new laboratory, he said, would be a challenge to achievement, fostering the spirit of adventure as well as yielding much of practical value. He believed that the laboratory's contributions in time of war were made possible by its earlier achievements in time of peace, and he thought that the significant time for research is not the time of immediate emergency.

Speeches of welcome to the new laboratory were made by representatives of the State of Massachusetts and the township of Falmouth. A message from the U.S. Naval Chief of Staff expressed high hopes for the continuing alliance of science with the Navy.

The inauguration of the new Laboratory of Oceanography was followed by a convocation on oceanography which proved wide in scope and penetrating in detail. A summary made at this stage can scarcely escape injustice to the many speakers, and the following notes give no more than a rough guide; the papers and discussion will be published by the National Research Council.

On the first day, emphasis was given to the need for team-work between specialists in physics, chemistry and biology, to ensure that those who specialize in one aspect of the subject are aware of the problems and advances in adjacent aspects. One example given was that a knowledge of the physics and chemistry helps to indicate the most productive areas in the oceans: a particular instance quoted was that the distance of the most productive region for cod fisheries off the coast of northern Norway depends on physical conditions which can be forecast. The importance of studying oceanic circulation was urged; its problems have been shown to be increasingly difficult as more observations are made, and it was generally agreed that much more effort than has been available in the past would have to be devoted to direct measurements using ships, telemetering buoys and submerged recorders, as well as to theoretical work and model experiments.

It was pointed out that although the basic principles which govern water movements have been known for more than a century, there are still difficulties such as turbulence, or random movements on various scales, which prevent us from understanding how the basic principles govern water movements in Nature. It was shown that a statistical approach to the theoretical treatment can be made where the analysis is too difficult and the data inadequate. Other speakers showed what oceanography might do for navigation, coastal engineering and other marine industries. It was urged that the efforts spent on using the sea and in protecting lives and human interests against it warrants an understanding of its behaviour as detailed as might be gained with the help of modern discriminating and refined scientific methods and techniques as well as by simple observation and reasoning.

The second day was devoted to the discussion of work bearing on the productivity of the oceans and the distribution of marine organisms. One of the chief contentions, that the amount of organic production in tropical and subtropical parts of the oceans is strictly dependent on the physical conditions, the supply of phosphate and nitrate from below being far more important than the varying illumination from day to day in such regions, had to be continued as an informal discussion in the evening. The main outcome seemed to be a resolution for wider repetition and extension of the work recently done by pioneers in the quantitative approach to the problem. In the consideration of possible links between climatic changes and oceanic productivity, a mechanism was outlined by which the decline in nutrient resources and fisheries in the western part of the English Channel might be explained by climatic changes over the far northern Atlantic Ocean. The available data indicated that the understanding of variations in a fishery may well require a knowledge of the deep-water circulation of the ocean as well as a study of the shelf on which the fish live.

Oceanographic and fisheries surveys of the subtropical and tropical regions of the central Pacific Ocean were used to show that fisheries exploiting the populations of the high seas could profit by guidance from recognizable features of the water circulation just as fishermen in marginal seas have been guided by topographical features. Bottom-living animals were not neglected: emphasis was laid on the uniformity and small number of species living on level sea bottoms as compared with the fauna of rocks, reefs and vegetation, which afford a greater variety of microclimates to their inhabitants. It was made very clear that team-work used to map the level sea floor communities would be a very profitable way of widening our knowledge of marine ecology. The last paper on this day, by Dr. George Wald, of Harvard University, on "The Ocean and Organic Evolution", had the most appreciative audience of the whole convocation. He discussed the ideas of Oparin[1] and extended them with the help of his own studies of retinal pigments and the muscle chemistry of the vertebrates and invertebrates.

The third day was devoted to submarine geology and the relations between oceanography and meteorology. The geological papers dealt largely with the structure of the ocean basins and sedimentation problems. Evidence of the existence of a sharp change in density in the rock about a mile below the sea bottom was given particular consideration. Other topics were evidence of growth of the oceans and atmosphere during geological time and of the changing conditions for plant and animal growth. The dredging of cretaceous shallow-water fossils from the summits of 6,000-ft. deep sea-mounts in the Pacific Ocean and a marked increase in the deposition of calcium carbonate since the middle of the cretaceous period were used as evidence that some 3,000–4,000 ft. depth of water has been added to the ocean since that time.

The discussions on oceanography and meteorology emphasized the similarity of the theoretical treatment needed for oceanic and atmospheric circulation. Prof. Palmén showed how recent studies of the budget of angular momentum in the atmosphere have suggested a new approach to the whole question of transfer of momentum from the atmosphere to the ocean. He demonstrated that the pressure forces produced by the differences in height of the water-level on the east and west sides of the continents provide a more effective mechanism than that of frictional forces at the bottom and the coasts. He gave numerical values of the sea slopes required to provide the necessary momentum transfer. This and following papers dealing with the role of inertia and stratification in the question of transfer of energy, and other aspects of transfer of energy between the ocean and atmosphere, were so specialized as to cause the convocation to end on a rather sober note, largely due to the conviction that the detailed study of such difficult topics is as essential for oceanography as for meteorology, so that oceanography cannot remain the rather light-hearted subject which it has been for the past hundred and fifty years.

The meetings were held in the lecture theatre o the Marine Biological Laboratory, and there was some pleasantry about what took place "on the other side of the street". Visitors to Woods Hole could not help being greatly impressed by the possibilities which exist in the neighbourliness of the Marine Biological Laboratory, the Oceanographic Institution the new Laboratory of Oceanography, and the laboratory of the Fish and Wildlife Service, for exchange of ideas and co-operation. It was a remarkable experience to hear so much about marine research and to enjoy the company of so many marine scientists, and like many other visitors from Europe I am grateful to the National Research Council and the Office of Naval Research for making this meeting possible.

G. E. R. DEACON

OBITUARIES

Prof. H. Stanley Allen, F.R.S.

HERBERT STANLEY ALLEN was born in Bodmin Cornwall, on December 29, 1873. The fifth son of Rev. Richard Allen, a Methodist minister, he was always proud of being "Cornish by birth". He received his early education at Kingswood School, Bath, where he won various scholarships and prizes was a senior prefect, and took first place for all England in the London Matriculation and, a year later, in the Cambridge Senior Local Examination. He was a contemporary of Prof. T. M. Lowry and a few years junior to Prof. A. E. Taylor.

In 1893 he entered Trinity College, Cambridge, and in 1897 gained a first class in the second part of the Natural Sciences Tripos. After a short time in a temporary post as assistant lecturer in Aberystwyth, he returned to Cambridge to take up research work under Prof. J. J. Thomson. From Cambridge he went to Renfrew in 1900 to take charge of Lord Blythswood's Physical Laboratory, and it was while living in Renfrew that he met Miss Jessie Macturk, whom he married in 1907. Their family consists of a son and a daughter. He joined the staff of the Physics Department at King's College, London, in 1905 and soon became a senior lecturer in physics. For his work there on the photo-electric effect he received the degree of D.Sc. in 1909.

Allen returned to Scotland in 1920 and served, first as a lecturer and later as a reader, on Prof. C. G. Barkla's staff in the University of Edinburgh. In 1923 he was appointed professor of natural philosophy in the United College of St. Salvator and St. Leonard in the University of St. Andrews. His first activity in St. Andrews was directed towards the reconstruction and enlargement of the Physics Laboratory which, after reconstruction, was formally opened by Sir William Bragg in 1925. His early researches covered a variety of subjects including photo-electricity, X-radiation, radioactivity, the Zeeman effect and spectroscopy. In St. Andrews his main interests were the quantum theory and spectroscopy, particularly the band spectrum of hydrogen.

His first text-book, "Photo-electricity", based on lectures he delivered at King's College, London, and published in 1913, contains an account of his own work, especially that on photo-electric fatigue. "The Quantum and its Interpretation" (1928) was, to quote his own words, "not a treatise on the quantum theory but an attempt to deal with the baffling problem of the nature of the quantum". Although no mean mathematician, he was never content with a purely mathematical representation of phenomena. Wherever possible, he tried to present a picture in terms of a 'model', and he endeavoured "to take a middle course between a mathematical and a purely descriptive treatment". His "Electrons and Waves" (1932) is devoted to the dilemma of particles versus waves. Allen and Moore's "Text Book of Practical Physics", first published in 1916, after frequent reprinting, is now in its third edition, and his "Text Book of Heat", written jointly with R. S. Maxwell, appeared in 1939.

He was elected a Fellow of the Physical Society in 1906 and of the Royal Society of Edinburgh in 1920. He served on the Council of both those Societies and was awarded the Makdougall–Brisbane Medal by the Royal Society of Edinburgh. He was admitted to the fellowship of the Royal Society in 1930, and this honour he shared with his brother, Edgar Johnson Allen, who was for many years director of the Marine Biological Laboratory at Plymouth. When he retired from the chair of natural philosophy in 1944, the University of St. Andrews elected him professor emeritus and conferred on him the degree of LL.D.

Prof. Allen was naturally shy and retiring, and only those privileged to know him most intimately realized the depth of kindness which lay behind his quiet dignity of manner. His junior colleagues gained much from his advice and encouragement, and his students will always remember him for his lucid style as a lecturer. Every lecture which he delivered was thought out with care and presented with the utmost precision and clarity. His whole life was devoted to the search for truth. There are many who mourn his death, which took place at the home of his daughter on April 27. D. Jack

Prof. J. P. Hill, F.R.S.

Prof. J. P. Hill died suddenly on May 24, in his eighty-first year. His first scientific paper was published in 1892; his most recent four years ago; and only three days before his death he was discussing with the librarian of the Zoological Society the placing of the illustrations of Part 7 of his series of papers on the development of the Monotremata, a paper that is now in the press. His span of active scientific work thus covered a period of more than sixty years. There can be few scientists who have enjoyed so long and so fruitful a life of research.

James Peter Hill was the son of Scottish parents. After attending the Royal High School in Edinburgh, he joined the Royal College of Science in London, before returning to Edinburgh, where he studied zoology under Cossar Ewart. His first appointment, in 1892, was as demonstrator in biology in the University of Sydney. From this office he was promoted, in 1904, to the post of lecturer in embryology. In 1906 he returned to England, to occupy the Jodrell chair of zoology and comparative anatomy in University College, London. He relinquished this appointment in 1921, to take up a chair of embryology and histology, which was specially created for him as part of the reorganization of the Department of Anatomy in University College that was carried out by Elliot Smith with the support of the Rockefeller Foundation. He retired from this post in 1938, when he reached the age of sixty-five. He was elected to the Royal Society in 1913, and was awarded the Darwin Medal in 1940. He was an honorary member of several foreign academies of science.

The scientific circle to which J. P. Hill was introduced as a young man in Sydney included the late Prof. J. T. Wilson, who afterwards became professor of anatomy in Cambridge; Sir Charles Martin, who was later professor of experimental pathology in the University of London; and the late Sir Grafton Elliot Smith, who had already begun his now classical studies of the morphology of the vertebrate brain. Hill's first research interest was in the Enteropneusta, but he very soon turned his attention to the embryology of the monotremes and the marsupials, a subject which remained his chief interest throughout his long career. His first paper in this field, published in collaboration with Martin, was entitled "A Platypus Embryo from the Intrauterine Egg". This proved to be the start of a systematic study of the embryology of the duck-billed platypus, which he carried out mainly in collaboration with J. T. Wilson. He also investigated the process of fertilization in monotremes, and the manner of formation of the corpus luteum, the phases of development of which he was able to correlate with the functional stages of the reproductive cycle. In addition, he devoted himself to the problem of the placentation of *Perameles*, showing that this animal has an allantoic placenta, and to the systematic study of the morphology and development of the urogenital organs in the Marsupialia. When he returned to England his attention became partly transferred to the embryology of Eutheria, and particularly to the development of the primates, including man. One of the most important of his publications is his 1932 Croonian Lecture of the Royal Society, on "The Developmental History of the Primates". This monograph provides what is now rightly regarded as the classical account of the blastocyst, of the manner of implantation, and of the formation and structure of the placenta in all the main subdivisions of primates.

Vol. 82 of the *Journal of Anatomy*, published in 1948, was dedicated to J. P. Hill. Prof. D. M. S. Watson, in a foreword, describes J. P. Hill as a general zoologist of wide interest and encyclopædic knowledge; and as a man of delightful and unique personality. He also provides a picture of an enthusiastic teacher; and of a scientist whose quality was not only revealed in his own writings, but also in the work of his research students. For his influence extended not only to his collaborators—J. Brontë Gatenby, Thomson Flynn, E. A. Fraser, A. Subba Rau, to name only a few—but also to numbers of others who, under his guidance and stimulus, undertook research on embryological subjects. J. P. Hill also did much to encourage the work on sex hormones that was proceeding in University College in the later 'twenties and early 'thirties.

It has been said of him that he was too meticulous a scientist, and that he carried a passion for certainty to such lengths that he would wait unnecessarily long to dot the 'i's' and cross the 't's' of his discoveries. A passion for certainty is, however, a fault in the right direction. If it led Hill to withhold from publication certain observations which might well have been published, we can find compensation in the fact that what he did record is of lasting value.

Those who knew him and whom he stimulated will never forget the slightly quizzical look over the half-lenses of his spectacles as he discussed the merit of some particular series of observations. Shortly before he died, he wrote in a letter: "I am getting very old and decrepit, and though I am still trying to do a little work it is becoming more and more of a labour". Perhaps he was physically decrepit; but intellectually he was unimpaired. At the age of eighty-one he had shown neither any sign of reduced interest in scientific work nor any tendency to lower the standards which had guided him through a career of meticulously accurate observation and single-minded purpose.

S. Zuckerman

NEWS and VIEWS

Physical and Inorganic Chemistry at Belfast: Dr. C. Kemball

Dr. Charles Kemball, who has been appointed to the chair of physical and inorganic chemistry in The Queen's University of Belfast, in succession to Prof. A. R. Ubbelohde (see *Nature*, April 17, p. 710), is a Fellow of Trinity College and demonstrator in physical chemistry in the University of Cambridge. Educated at Edinburgh Academy and Trinity College, Cambridge, he later became associated with Sir Eric Rideal in the Department of Colloid Science at Cambridge, first in research for the Ministry of Supply and afterwards in more academic studies. Here the pattern of his later work took shape, and his early studies of the surface chemistry of mercury and the thermodynamics of adsorption and monolayers fostered an interest in chemisorption and surface catalysis which has culminated in his well-known studies of the deuteration of hydrides at metal surfaces. Using the mass spectrograph, Dr. Kemball has thrown light on the fundamental aspects of surface reactions, and his papers show him to be a master of clear exposition. During 1946–47 he was awarded a Commonwealth Fellowship and worked in the United States with Sir Hugh Taylor at Princeton University; on his return to Cambridge he continued his research in the Department of Colloid Science. In 1949 he moved to the Department of Physical Chemistry as demonstrator and also became junior bursar of Trinity College. As a teacher Dr. Kemball is well liked by his students and, though his departure is a great loss to chemistry at Cambridge, he carries with him the best wishes of his colleagues for success in his new work.

Automatic Control and Computing at the National Physical Laboratory: Mr. R. H. Tizard

A new Division at the National Physical Laboratory, which has been formed by the amalgamation of the Electronics and the Control Mechanisms Sections, is to be called the Control Mechanisms and Electronics Division. The field to be covered by the new Division is the automatic control of industrial, administrative and experimental operations and the development of techniques and equipment for data processing and computation. An industrial example of such mechanisms is the automatic control of machines producing precision components in large quantities. Not only are the operations speeded up but also personnel can be released from the boredom of repetitive work. It is hoped that this trend will not be confined to the factory floor but that many routine office operations will also be carried out by suitable machines. The new Division is represented on a small group formed to study this subject. This group also includes representatives from the Organization and Methods Division of the Treasury and from the Ministry of National Insurance. The new Division is developing automatic or semi-automatic equipment to digest test records and similar material and produce it in the form of graphs or typescript ready for immediate use. Many of the techniques employed are electronic in the sense that thermionic valves are used, but the terms of reference exclude radio and acoustic applications. Thus the Control Mechanisms and Electronics Division is interested in the application of all forms of light electro-mechanical devices to special problems. Mr. R. H. Tizard, of the Metrology Division of the Laboratory, has been appointed officer-in-charge of the new Division.

Liaison Officers at the National Physical Laboratory: E. I. Brimelow and A. J. Garratt, M.B.E.

The application by British industry of results of research from the National Physical Laboratory is fostered by direct contact between the research workers at the Laboratory and individuals in industry, as well as by contributions to the scientific and technical press. It is, however, felt that much more could be done in the way of bridging the gap between the research laboratory and industry. To meet this need E. I. Brimelow and A. J. Garratt have been appointed liaison officers to work with industry. Mr. Garratt is a physicist and an honours graduate of the University of London. He was in the Civil Service from 1940 until 1951, first with the Ministry of Supply (Armament Research Establishment) and later with the Festival of Britain Office as staff physicist. More recently, he has held an appointment in industry and is a scientific adviser to the B.B.C. Television Service. Mr. E. I. Brimelow is a metallurgical engineer and an honours graduate of the University of Liverpool. He was for eight years from 1936 engaged in research at the Royal Aircraft Establishment, Farnborough, on materials for use in aircraft. After two years in industry as a metallurgist and research and development manager, he joined in 1949 the Chief Scientific Adviser's Division of the Ministry of Works, where he remained until transferred to the Building Research Station (Department of Scientific and Industrial Research) in 1950. He has also served on various technical committees of the British Standards Institution and on advisory committees of the Ministry of Supply.

Sir Richard Owen (1804–92)

The first anatomist of his age and one of the greatest of all times, Sir Richard Owen was born at Lancaster one hundred and fifty years ago, on July 20, 1804. He studied anatomy at Edinburgh under John Barclay, worked as prosector with John Abernethy at St. Bartholomew's Hospital, London, and at the age of twenty-two became a member of the Royal College of Surgeons of England, in the neighbourhood of which he set up practice. He was soon to become one of the most distinguished truants from medical practice, and it was at the College that he began his career as comparative anatomist by cataloguing the Hunterian Collection under William Clift, whose daughter he married and whom he succeeded as conservator of the Museum. His "Memoir on the Pearly Nautilus" won him election to the Royal Society in 1834, and two years later he was appointed the first Hunterian professor of comparative anatomy and physiology at the Royal College of Surgeons, being elected in 1843 as one of its original three hundred Fellows. In 1856 Owen became superintendent of the Natural History Department of the British Museum and was responsible for the building of the present Museum at South Kensington. An indefatigable worker and a prolific writer of such monumental works as "The Anatomy and Physiology of the Vertebrates" (3 vols., 1866–68), his anatomical interests ranged from parasitic worms and brachiopods to the primates; as a palæontologist he revelled in the reconstruction of extinct animals, and he introduced into comparative anatomy the conceptions of homology and analogy. His numerous honours included the Copley and a Royal Medal of the Royal Society, the Gold Medal of the Royal College of Surgeons, the Prix Cuvier of the French Academy, and the K.C.B. in 1884. Tall and ungainly, with a massive head and prominent glittering eyes, Owen was inclined to be overbearing and jealous. He died on December 18, 1892, aged eighty-eight.

Higher Technological Education in Great Britain

In a statement in the House of Commons on July 13, Mr. R. A. Butler, Chancellor of the Exchequer, stated that he has now approved plans for the development of higher technological education in Britain outside London. The University Grants Committee was asked last year to consult with the universities and colleges concerned, and as a result of the Committee's recommendations, Mr. Butler announced that the main developments outside London will be in Glasgow, Manchester, Leeds and Birmingham, at institutions already in receipt of recurrent grants from the University Grants Committee. These plans, and those already announced for the Imperial College of Science and Technology, London, will necessitate an increase in the funds available to the University Grants Committee, for both recurrent and non-recurrent purposes, in the last three years of the quinquennium 1952–57 covered by the present grants. Referring to the Bradford Technical College, Mr. Butler stated that the University Grants Committee had been unable to include this institution in its recommendations because of the necessity of limiting the number of university institutions concerned with higher technological education.

Insecticide and Fungicide Research Services in Great Britain

The Fungicide and Insecticide Research Co-ordination Service, an interdepartmental service the Secretariat of which used to be accommodated at the offices of the Agricultural Research Council, has recently been dissolved and the following alternative arrangements made. The "Insecticides Abstracts and News Summaries" will in future be issued from the office of the Colonial Products Laboratory, Imperial Institute Building, South Kensington, London, S.W.7, under the direction of Dr. R. A. E. Galley. They will be compiled with the view of meeting the needs of Colonial research workers, to whom distribution will for the time being be restricted. The analytical work formerly carried out at Woolwich will in future be done at Long Ashton Research Station, near Bristol, under the direction of Dr. J. T. Martin. The Insecticides Standing Conference, the interdepartmental body formerly responsible for co-ordination of work on insecticides and fungicides and for the Fungicide and Insecticide Research Co-ordination Service, is to be reconstituted as a smaller interdepartmental Committee on Insecticides and Fungicides, the secretarial arrangements for which will be undertaken by the Agricultural Research Council.

Hydrogen in the Manufacture of Steel

More than eighty years ago Thomas Graham, who was then Master of the Mint, observed that hydrogen forms a substantial proportion of the gases which are evolved when ferrous materials are heated in vacuum. It was not, however, until some fifteen or twenty years ago that the great importance of this gas began to be fully realized. In the solidification of the ingot, and right through to the final user, hydrogen can exert a distinctly detrimental effect, of which the steelmaker is now fully aware and takes proper precautions to avoid. Blow-holes in steel ingots, hair-cracks in forgings, and blisters in thin sheets are examples of the dangers which may arise from excessively high hydrogen contents, while the ductility of the material as measured by the reduction of area falls progressively as the hydrogen content rises. In the *Review* issued by Murex, Ltd., Rainham, Essex (1, No. 13, 305; 1954), K. C. Barraclough provides a very useful, critical summary of existing knowledge regarding the effect of hydrogen on steel, in which a substantial amount of original data is also incorporated. The determination of the hydrogen content is by no means an easy matter in view of the fact that only rarely does the amount of this gas in steel exceed 0·001 per cent, and the method used in the Brown–Firth Research Laboratories, Sheffield, with which the author is connected, is described in detail. Methods of collecting the samples, and typical values for steels of different qualities and made by different processes are given, and the effects of heat-treatment on the hydrogen content, and therefore the mechanical properties, are discussed for a number of different materials. Mainly as a result of the work of Prof. J. H. Andrew and his collaborators, it is now well known that the 'hair-cracking' of steel ingots and forgings is intimately connected with the hydrogen content, and this question of outstanding importance both to the maker and the user is considered in some detail.

Absorption by Leaves from Nutrient Sprays

The ability of the leaves of barley, brussels sprout, french bean, tomato and sugar-beet to take up nitrogen, phosphorus and potassium from nutrient solutions applied as sprays has been reported by G. N. Thorne (*J. Exp. Bot.*, 5, 37; 1954). The plants, which were grown in pots of soil and sprayed, usually daily, with the nutrient solutions and a spreader, had higher nutrient contents and dry weights than control plants sprayed with water and the spreader only. The absorption of nutrients by the leaves was not restricted to plants with a very low nutrient supply to the roots. An increase in nutrient content occurred with high or low levels of nutrient supply to the roots and was approximately proportional to the concentration of spray and to its frequency of spraying. The nitrogen content of sugar-beet plants was increased equally by spraying with solutions supplying ammonium sulphate, calcium nitrate or urea in equivalent concentrations. It was observed that nutrient uptake from solutions sprayed on leaves influenced uptake by the roots, so that the additional amounts of nutrient contained in sprayed plants may be greater or smaller than the amount absorbed from the spray by the leaves.

Triploid Dactylorchid Hybrids

PROF. J. HESLOP-HARRISON (*Ann. Bot.*, N.S., 17, 63 and 539; 1953) has reported on the cytology of some triploid dactylorchid hybrids. During meiosis in naturally occurring triploid hybrids between the diploid *Orchis fuchsii* Druce ($2n = 40$) and the two tetraploids, *O. purpurella* Steph. and *O. praetermissa* Druce ($2n = 80$), there is a regular formation of twenty bivalents and twenty univalents. Since the two tetraploid species themselves show typical 'diploid' behaviour in synapsis and fertility, they are considered to be allopolyploids, and the hybrid pairing to be allosyndetic. The implication is therefore that both tetraploids are amphidiploids of which *O. fuchsii* has been one progenitor. It is suggested that varieties of the polytypic diploid *O. latifolia* L. sec. Pugsl. may have been the other progenitors. A feature of interest in the microsporogenesis of both parents and hybrids is the close synchronization of nuclear events in the pollen massulæ, which behave as physiological units throughout meiosis and pollen-mitosis. In the triploids, although numerous dysploid nuclei are produced, none dies prematurely, probably because of mutual compensation within what is, in effect, a common cytoplasmic matrix.

Earthquakes during April

DURING the month of April twenty-seven strong earthquakes were recorded, including seven shocks of magnitude 6 or greater. The greatest had magnitude 7½ but only did minor damage in western Mexico on April 29 (epicentre at lat. 29½° N., long. 112½° W.). The shocks of deepest focus occurred on April 5 on the Argentine–Bolivia–Chile borders (epicentre at lat. 23° S., long. 67½° W., depth of focus 150 km.) and on April 13 in Catamarca Province, Argentine (epicentre at lat. 27½° S., long. 66° W., depth of focus 200 km.). All other earthquakes had intermediate or shallow foci. The greatest damage was done by the earthquakes in central Greece, beginning on April 30 (see *Nature*, May 29, p. 1024). Minor damage was done at Watsonville and Gilroy by an earthquake on April 25 in central California. Several of the shocks were felt, including one on April 4 in the south-west Alps near Onstmettingen, Tailfingen and Pfeffingen, one on April 5 near Rastatt (both with Modified Mercalli scale intensity 5), and one on April 25 near Friuli (Italy).

University of London: Appointments

THE following appointments have been made in the University of London: Prof. R. M. Barrer, professor of chemistry in the University of Aberdeen, to the University chair of physical chemistry tenable at the Imperial College of Science and Technology; Dr. C. Domb, lecturer in mathematics in the University of Cambridge, to the University chair of theoretical physics tenable at King's College; Dr. J. A. C. Knox, lecturer in King's College, London, to the University chair of physiology tenable at Queen Elizabeth College; Dr. D. R. Wilkie, Locke Research Fellow of the Royal Society, to the University readership in experimental physiology tenable at University College; and Dr. M. J. Wise, lecturer in geography in the London School of Economics and Political Science, to the Sir Ernest Cassel readership in economic geography tenable at that School.

Ramsay Memorial Fellowships for 1954–55

RAMSAY MEMORIAL FELLOWSHIPS for research in chemistry have been awarded for 1954–55 to the following: J. R. Anderson, British Fellowship at the University of Cambridge; G. A. Sim, Glasgow Fellowship; Dr. J. A. Davies, Canadian Fellowship at the University of Leeds; G. Moralli, French Fellowship at King's College, Newcastle upon Tyne; Dr. C. Alfonso, Spanish Fellowship at the University of Birmingham; Dr. H. Jucker, Swiss Fellowship at King's College, London; and Dr. O. R. Rodig, United States Fellowship at the University of Manchester. The following Fellowships have been renewed for a year: G. T. Rogers, British Fellowship at the University of Cambridge; Dr. K. Saito, Japanese Fellowship at University College London; W. G. Hanger, New Zealand Fellowship at the University of Cambridge; S. Amer, Spanish Fellowship at the University of Cambridge; and R. H. Doremus, United States Fellowship at the University of Cambridge.

Salters' Company: Awards for 1954–55

THE Court of the Salters' Company has elected G. Hetherington to be a Salters' Fellow for the year 1954–55 and has extended the fellowship held by P. P. Manning for a second year. Mr. Hetherington, who held a Salters' Scholarship during 1953–54, has been working in the Chemistry Department at King's College, Newcastle upon Tyne, on the chemistry of nitryl fluoride; Mr. Manning has been carrying out research work in the Chemistry Department of the University of Leeds on chemical kinetics of cyclic monomers forming linear polymers, and theoretical studies on the polymerization of olefines. The following have been elected Salters' Scholars for the year 1954–55: C. P. Brown (University of Nottingham), M. McLeman (Imperial College of Science and Technology, London), A. D. Shipman (University of Bristol), H. Spoel (University of Oxford), and W. L. Wilkinson (University of Cambridge).

Inter-African Soils Conference in Léopoldville, Belgian Congo

THE second Inter-African Soils Conference will be held in Léopoldville, Belgian Congo, during August 9–15. A number of specialists in agronomy, soil science and conservation, not exceeding eighty in number, will be present at the Conference as delegates of the participating countries and, in addition, there will be some representatives from interested organizations. The work of the Conference will be divided into three sections: the characterization, classification and mapping of African soils; physical, chemical and biological research concerning these soils; and soil conservation. In general, a review will be made of the work accomplished following the recommendations of the previous Conference, held in Goma. The stability and agricultural characteristics of African soils and the formation of hardpan and lateritic crusts will be considered, and in the sessions on soil conservation and utilization the following topics will be discussed: various causes of erosion; means and methods used in the control of erosion;

utilization of agricultural, sylvicultural and pastoral soils; traditional systems of agriculture; possibility of utilization and transformation of shifting cultures; large-scale trials of agricultural mechanization; fertilizers and amendments; improvement of swampy soils. The evolution of the arid zones in Africa will also be discussed. Immediately after the Conference, the Fifth International Congress of Soil Science will be held in Léopoldville, and after this Congress a number of excursions will be made in the Belgian Congo. Further information regarding the Conference can be obtained from the Inter-African Bureau for Soils at 57 rue Cuvier, Paris 5e.

Optical Conferences in Italy

Two conferences of optical interest are being held this September in Italy, the first being an international symposium on infra-red radiation at the University of Parma during September 3–7. This is being sponsored by the International Union of Physics, the International Commission for Optics and other bodies in Italy, and will commemorate the hundredth anniversary of the death of Macedonio Melloni, the founder of infra-red studies at Parma. Further particulars of this meeting can be obtained from Prof. G. Polvani, president of the Italian Physical Society, Via Saldini 50, Milano. The second conference will be in Florence at the National Optical Institute of Italy during September 10–16, and will be on "Problems in Contemporary Optics". The subjects to be discussed are optics and information, non-classical focusing devices, optical problems of television, optical surface manufacturing, three-dimensional optics and retinal problems. Details of this meeting can be obtained from Prof. G. Toraldo di Francia, Instituto Nazionale di Ottica, Arcetri-Firenze.

Autumn Meeting in Switzerland of the Institute of Metals

The autumn meeting of the Institute of Metals will be held this year in Switzerland during September 6–14, by invitation of the Société Swisse des Constructeurs de Machines and the Association Suisse pour l'Essai des Matériaux. The meeting will open in Zurich on September 6 and then will move to Montreux on September 11. On the morning of the first day the Institute of Metals (Platinum) Medal for 1953 will be presented to Dr. Georg Masing (Göttingen), and then two papers on grain refinement will be read and discussed. The rest of the meeting will be devoted to excursions to various places of interest in Switzerland, including a large number of engineering and metallurgical works. All arrangements for booking accommodation in Switzerland should be made before July 31 through the Post-Order Department, Thos. Cook and Son, Ltd., Berkeley Street, London, W.1, quoting *POD/S/22222*.

Announcements

The Dr. W. S. Bruce Memorial Prize for 1954, commemorating Dr. W. S. Bruce, the Scottish explorer and scientific investigator in polar regions, has been awarded to Dr. R. M. Laws, of the National Institute of Oceanography, for his investigations in the South Orkney Islands and South Georgia, particularly in the biology and life-history of elephant seals. The committee of award is appointed by the Royal Physical Society of Edinburgh, the Royal Scottish Geographical Society and the Royal Society of Edinburgh.

The trustees of the Ciba Foundation have appointed Prof. F. G. Young, professor of biochemistry in the University of Cambridge, and Prof. A. Haddow, director of the Chester Beatty Research Institute, London, to the executive council of the Foundation to assist its scientific work.

Mr. Fred Smith, of Wm. Smith and Co., Ltd., Cliffe Dyeworks, Bruntcliffe, succeeds the late Mr. F. L. Goodall as president of the Society of Dyers and Colourists. Mr. Smith has been associated with the Society for more than forty years, being a vice-president since 1939, and for his exceptional services he was awarded in 1947 the Society's Gold Medal.

Dr. H. T. Openshaw, formerly Purdie lecturer in chemistry in the University of St. Andrews, has been appointed head of the Chemical Division of the Wellcome Research Laboratories, Beckenham, in succession to Dr. D. W. Adamson, who last year became research director of the Wellcome Foundation, Ltd., and director of the Wellcome Research Laboratories (see *Nature*, 172, 654; 1953).

The following have been appointed to lectureships in the University of Sheffield: E. J. Sarginson (civil engineering) and J. R. Metcalf (mining).

Owing to illness, Sir Geoffrey Taylor was unable to deliver the thirty-eighth Guthrie Lecture before the Physical Society last March. He will now give it on September 24 in the Lecture Theatre of the Science Museum, Exhibition Road, London, S.W.7, at 5 p.m., his subject being "Diffusion and Mass Transport in Tubes". The Lecture will be open to the general public.

The Oliver Memorial Fund is offering an award of £50 to a British subject for original work or services in connexion with research, organization or the donor aspect of blood transfusion. Applications or information directing attention to suitable candidates must be submitted before August 31 to the honorary treasurer of the Fund, F. W. Mills, c/o National Provincial Bank, Ltd., Holborn Circus, London, E.C.1.

The Textile Institute, 10 Blackfriars Street, Manchester 3, will hold a conference on "Fibre Friction" in Ghent during September 9–13, this being the first conference that the Institute will have held outside Great Britain since 1928. It is noteworthy that the Institute's first overseas meeting was in Ghent during 1913. For the present conference, the Institute has received the co-operation of the Centre Scientifique et Technique de l'Industrie Textile Belge, the University of Ghent and the organizers of the Ghent International Trade Fair, which will be in progress at the time. Seven papers will be read by British, Belgian and Dutch scientific workers.

A symposium on "The Vegetation Types of India" will be held by the Indian Botanical Society in Baroda during December 31–January 1. Among the types of vegetation of the different regions of India to be discussed will be forests, grasslands, aquatic vegetation, mangrove, desert vegetation, and vegetation of other habitats such as sand dunes, silted banks, eroded and barren areas. The ecological accounts will be given under the following headings: climate, geology and soils, biotic features, floristic composition, succession and climaxes. Copies of papers for the symposium should be submitted before September 1 to Dr. R. Misra, Department of Botany, University of Saugar, Sagar, India, from whom all further information can be obtained.

ECONOMIC SURVEY OF THE BRITISH EAST AFRICAN TERRITORIES

THE population of Kenya, Uganda and Tanganyika has increased in two decades from less than twelve to nearly twenty million, and continues to increase by some three to four hundred thousand a year. Against this background the expenditure of £10 million a year on development under the 1947–56 development programme seems a relatively small sum. These points are brought out by a recent survey of economic conditions in East Africa proper together with Zanzibar, Somaliland, Aden, Mauritius and Seychelles*. The survey forms part of "An Economic Survey of the Colonial Territories, 1951" which is designed to provide a convenient summary account of conditions in overseas territories similar to those published at roughly annual intervals before the Second World War, and last issued in 1940 ("An Economic Survey of the Colonial Empire (1937)", Col. No. 179). The present survey does not, however, attempt to cover the decade 1937–47. It is concerned mainly with post-war developments, pre-war figures being quoted only as a basis for comparison. Six volumes have so far been published since February 1952: Vol. 1, Central African and High Commission Territories (Col. No. 281–1); Vol. 3, West African Territories (Col. No. 281–3); Vol. 4, West Indian and American Territories (Col. No. 281–4); Vol. 6, Mediterranean and Pacific Territories (Col. No. 281–6); Vol. 7, Products of the Colonial Territories (Col. No. 281–7); and the present volume. A final volume yet to appear, on the Far Eastern territories, will complete the first comprehensive post-war survey. Although referring nominally to 1951, each volume has been kept up to date by the inclusion of relevant statistics available at the time of publication. The whole series will provide an admirable datum from which to assess progress during the second half of the current development programmes at the end of 1956.

In conformity with the general plan, Vol. 2 treats each territory independently under four main headings: general background, productive activities, finance and trade, and development. The first section in each case is more important than the heading suggests and includes a brief description of geographical features, a full discussion of population data and problems, and a summary of the main facts relating to social, political and economic conditions and legislation, transport and communications. The second is not confined to commercial activities but offers much valuable information, supported so far as possible by statistics, on such topics as subsistence agriculture and domestic industries. The work of the East African High Commission and the East African Currency Board which concerns Kenya, Uganda and Tanganyika collectively, and the external trade of the three countries, are discussed separately in an appendix.

A large part of the report is devoted to commercial production, trade and finance, but the authors rightly emphasize that the overwhelming majority of the population of the mainland territories live directly off the land by subsistence cultivation and nomadic pastoralism. Since responsibility for the future stability of East Africa will presumably sooner or later rest with this majority instead of with the sixty thousand or so European settlers, their welfare is a matter of first importance. It is encouraging to find that a substantial proportion of the revenue derived from increased commercial output, Colonial Development and Welfare funds and other sources has been used for combating the various problems resulting from increasing population and consequent shortage of productive land. So far as can be estimated, the total cultivated area amounts to only about 10 per cent of Uganda, 5 per cent of Kenya and 3 per cent of Tanganyika; but owing to pests, deficient or uncertain water supplies and other difficulties, there is little hope of solving the problem by extension of the cultivated area alone. On the contrary, spontaneous attempts by peasant cultivators to achieve this end by keeping temporary plots under cultivation for longer periods at a time, clearance of woodland and encroachment on marginal land have led to loss of fertility and aggravated the menace of soil erosion. Already in Kenya some 600,000 acres of the Highlands are estimated to be in need of protection. It is difficult to judge from the survey how much progress has been made; but there are some indications. In the Central Province of Kenya 81,000 acres are now terraced, and the Forestry Department is undertaking extensive afforestation schemes, the present target being 6,000 acres of new softwood plantations a year. In Uganda 45,000 acres are being developed as a source of commercial softwoods; but these together with protective measures elsewhere will help to mitigate the losses due to soil erosion.

Progress is also reported from all three High Commission Territories in the campaign to encourage Africans to abandon the primitive practices of shifting cultivation and fragmentation of holdings through inheritance, in favour of permanent cultivation of small holdings varying from five to thirty acres, and family group farms. The Kikuyu are settling in increasing numbers; more use is being made of mechanical ploughs and other equipment loaned by government centres in Tanganyika; and strip cultivation is spreading in Uganda. The effects of more elaborate measures for rehabilitation of land (for example, the Sukumuland Scheme in Lake Province, Tanganyika) are cumulative and cannot be fairly assessed at this early stage of development. Before leaving the subject, it is worthy of note that subsistence production of both maize and groundnuts in Uganda is estimated to have increased two and a half times between 1938 and 1951, far in excess of the increase of population even if a considerable margin of error be taken into account.

On the commercial side a net improvement in the balance of visible trade of the High Commission Territories is reported for 1952, Kenya's £29·6 million excess of imports over exports for that year being more than compensated by the surplus exports of Uganda (£23·4 million) and Tanganyika (£10·5 million). Notable increases have been effected in the production and export of tea and wattle-bark from Kenya; sisal, coffee and cotton lint from Tanganyika; cotton (due mainly to the Abyan irrigation scheme in the Western Protectorate) from Aden; and sugar from Mauritius. In the last-named Colony attempts to broaden the basis of the economy have met with little success, sugar production having reached a new peak of 515,000 tons in 1952 compared with the pre-war peak of 320,000 tons in 1938. Industrial development in East Africa has continued to expand for the dual purpose of supplying the home market with consumer goods (capital and producer's goods accounted for more than half the retained imports in 1951) and for social ends—to absorb some of the surplus labour created by the continued drift into the towns. Other developments await improvement of communications. The production of copper at Kilembe in south-west Uganda is due to commence this year, but large-scale output cannot be expected until the 215-mile railway extension from Kampala, already proceeding west of Mityana, has been completed. The importance attached to development of communications may be gauged from the fact that the East African Railways and Harbours Administration ranks as the largest industrial undertaking in the High Commission area, with a staff of more than 32,000, of whom 857 are Europeans.

---

* Colonial Office. An Economic Survey of the Colonial Territories, 1951: Vol. 2, The East African Territories. (Col. No. 281–2.) Pp. 203. (London: H.M.S.O., 1954.) 22s. 6d. net.

In the survey as a whole, comparatively little reference has been made to pre-war figures which would have made it easier to review post-war progress in comparative terms. On the other hand, the appendix contains a useful supplement on trade in which an attempt has been made to compare conditions before and after 1949 when trade statistics for the High Commission Territories were placed on a common basis. This includes a detailed analysis of the direction of trade in leading commodities for the three countries, similar to those given for Aden, Zanzibar and Mauritius earlier in the survey.

It would be futile to attempt to summarize the findings of a report of this scope in the brief space of a review. There can be no question that it is a highly competent and valuable basic document for all who are concerned with East African affairs. Such deficiencies as there are mainly arise from the inadequacy of statistical data relating to the activities of 90 per cent of the inhabitants. It seems likely, for example, that the annual rate of natural increase of the African population of Kenya (1½–2 per cent), Uganda (1–1½ per cent) and Tanganyika (1–2 per cent) may be under-estimated. According to the present survey and the survey for 1936 (Col. No. 149), the total population of the three territories increased from some twelve million to nearly eighteen million during the twelve-year period 1937–48, corresponding to a natural increase of nearly 5 per cent a year. Allowing for immigration, which at the peak of the post-war influx into Kenya reached 59,000 in 1951, and a higher than average figure for the Indian minority, the overall rate of natural increase among the African population prior to the 1948 census must have been well in excess of 2 per cent. In any event, at least a temporary acceleration rather than a decline in the rate of increase must be expected as current expenditure on the development of medical services takes effect. Without attaching undue importance to figures which can be no more than rough approximations and which are stated in the survey in carefully guarded terms, one hopes that the magnitude of the population problem has not been under-estimated. The next census will no doubt shed more light on the subject. At present large sums are being spent on what may be termed basic development (hydrological and other surveys, research, training and education), as distinct from more publicized industrial ventures like the Owen Falls scheme, with consequences that remain to be foreseen. Meanwhile, here are food for thought and data for research in abundance.

A. J. Hunt

UNESCO ADVISORY COMMITTEE ON ARID ZONE RESEARCH

The Advisory Committee on Arid Zone Research of the United Nations Educational, Scientific and Cultural Organization (Unesco) held its seventh session during May 4–7 in Paris. The meeting was attended by members from Australia, India, Italy, Mexico, Syria, Turkey, the United Kingdom and the United States and, as on previous occasions, by representatives from various Specialized Agencies of the United Nations Organization and from international scientific and engineering bodies, and by French members of the Arid Zone Panel of Honorary Consultants. The principal recommendations made by the Committee were as follows.

Symposia and reports. It was proposed that the secretariat should explore the possibility of holding a small symposium in 1955 on human and animal ecology in arid zones, which would enable the proceedings of such a symposium to be published in conjunction with reports on this subject that are being obtained. With regard to the symposium on problems related to arid zone research, sponsored by the American Association for the Advancement of Science, which is to be held in New Mexico during April 27–28, 1955, it was proposed that Unesco should make a grant to assist travel of scientists attending the symposium and also that the Arid Zone Research Committee should hold its ninth session in New Mexico in conjunction with this symposium. It was recommended that review reports should be obtained in 1956 on the formation and erosion of soils in arid zones as affected by climatic factors; these reports could then be published with the proceedings of a symposium on the same subject that is due to be held in the same year.

Travelling fellowships for senior scientists. Fellowships should be given to enable senior scientists to visit institutions outside their own country and, when these are given, the recipients should be allowed as much latitude as possible with regard to travel within the country visited.

Handbook and survey. At previous meetings it was decided to recommend the production of a handbook to guide in the collection of basic data that would be required when making plans for the development of an arid area, and preparations for writing this handbook are well under way. The Committee considered the advisability of instigating an integrated survey of one or more restricted areas on the lines proposed in such a handbook. It recommended that Dr. B. T. Dickson, who is editor of the handbook, should assemble information on such survey work that has been carried out in Australia and elsewhere, and that the Committee should consider the proposal at its next meeting.

Research projects. As a result of recommendations made by the Committee at previous meetings, Unesco has given grants for research on the following subjects: the geographical potentialities of coastal deserts; a survey of wind energy and of energy requirements in a typical arid area (Somaliland); the flow of underground water in calcareous mountains; the sulphate- and nitrate-rich soils of Algeria; changes in climate during the Quaternary Period in Israel, as evidenced by pollen analysis; the rolé of dew in plant growth in arid regions; plant ecological studies in French North Africa; the role of vertebrates in spreading desert conditions in India; and the physiology of the camel. At the meeting in Paris, reports on these investigations were received by the Committee, and grants were recommended for the development and testing of apparatus for the measurement of dew and for the study of plant distribution and ecology in the Rajistan desert in India.

Future meeting. The Committee will hold its next session in New Delhi during October this year in conjunction with the symposium on wind and solar energy that has been arranged at the invitation, and with the help, of the Government of India.

CHEMISTRY AND PHYSICS OF SYNTHETIC FIBRES

ALTHOUGH the subject of 'man-made' fibres is well to the fore in the world of polymer technology and names of new fibres such as 'Terylene' and 'Orlon' are beginning to compete in the housewife's mind with nylon, major discussions in Britain on chemical aspects of this topic have been few. The three-day symposium held during March 24–26 by the Plastics and Polymer Group of the Society of Chemical Industry on the subject of "The Chemistry and Physics of Synthetic Fibres", at the Institution of Electrical Engineers, Savoy Place, London, was therefore timely. More than three hundred participants, including a number from overseas, attended, and some interesting papers were read and discussed. During the first session, Mr. J. R. Whinfield (Terylene Council, Imperial Chemical Industries, Ltd.), chairman of the Group, presided.

Dr. R. Hill (Terylene Council, Imperial Chemical Industries, Ltd.), in an introductory paper on "Chemical Aspects of Fibres", discussed the structural features in polymers which have led to the mechanical behaviour characterizing rubbers, plastics and fibres; for the development of fibre properties a macromolecule needs to possess a regular, crystallizable structure and high interchain forces. In materials such as polyamides, polyurethanes and polyesters, these features are present, but fibre properties can be seriously affected if any branching or cross-linking occurs during condensation owing to the presence of impurities. In the vinyl polymer field, Dr. Hill referred to grafting, a new method by which the properties of a given polymer can be modified. It seems unlikely, partly for economic reasons, that any completely new fibre-forming polymers will be commercialized in the near future, but possible developments in such materials as polyvinylidene cyanide and polymers obtained by ring-opening of oxacyclobutane derivatives and N-carboxyamino-acid anhydrides were mentioned.

Among the new materials which have aroused interest in recent years are the polyaminotriazoles, which may be obtained by the reaction of dibasic acids with rather more than two moles of hydrazine; the recurring polar linkage in these polymers is a 4-amino-1 : 2 : 4-triazole ring. Mr. J. W. Fisher (British Celanese, Ltd.) gave an account of the chemistry and use of "Polyaminotriazoles as Fibre-forming Materials". A typical polyaminotriazole, that based on sebacic acid, has a melting point of 256° C. and can be melt-spun and cold-drawn to give yarns with mechanical properties generally similar to those of nylon or 'Terylene' and which can readily be dyed with dispersed acetate and wool colours. A structure of the polymer, as shown by X-ray examination, was proposed, involving a planar chain in which the octamethylene segments zig-zag at an angle of 20° on either side of the general fibre axis, and a resonant triazole ring; hydrogen-bonding between exocyclic amino-groups and nitrogen atoms in another ring is thought to be responsible for the high melting point of the polymer.

Turning to a subject related to the production of synthetic fibres from a natural material, Dr. W. E. F. Naismith (Nobel Division, Imperial Chemical Industries, Ltd.) discussed the "Chemical Denaturation of Groundnut Protein and Fibre-Formation". The globular proteins of groundnut must first be converted to an unfolded configuration (denaturation) before they can be spun: the denaturation by urea, guanidine salts and a series of organic bases has been investigated by measurement of the rise in viscosity increments of the solutions, and interpreted in terms of an increase in asymmetry of the protein molecules, using Simha's equation to calculate axial ratios. A definite relationship has been found between the ability of a base to cause rise in viscosity increment, and its ability to give spinnable solutions.

Few fundamental studies have been published of the industrially well-established processes for preparing polyamides from compounds containing carboxylic acid and amino-groups or by opening lactam rings. Dr. A. B. Meggy (University of Leeds) outlined a new thermodynamic method of attack in a paper on the "Free Energy of Formation of the Amide Bond in Polyamides". Equations were deduced in the case of the equilibrium between carboxyl, amino and amide groups and water molecules, relating the equilibrium constant k', the number-average chain length and the partial pressure of water. The effect of the presence of a cyclic monomer in amount determined by a second equilibrium constant k_1 was discussed, in cases where 5- to 8-membered rings might be formed. From somewhat limited data on the variation of k_1 with temperature T for ε-caprolactam, the heat of formation ΔH, entropy ΔS and free energy ΔF of the polyamide bond in polyaminocaproic acid have been calculated; the value of ΔH obtained agrees well with the experimental value. In the subsequent discussion, Dr. J. Saunders referred to other data on k_1 versus T which give a ΔH value according to Dr. Meggy's method which is considerably too high.

During the second session, Prof. J. B. Speakman (University of Leeds) assumed the chair. Dr. L. B. Morgan (Dyestuffs Division, Imperial Chemical Industries, Ltd.) discussed "Crystallization Phenomena in Fibre-Forming Polymers", his paper being illustrated by an excellent film showing the crystallization of polyethylene terephthalate from its melt, in spherulitic structures. Dr. Morgan's main thesis was that, after nucleation, preferential crystal growth takes place along the direction of the polymer chains rather than by sideways accretion, and that, during growth, coiling occurs with the formation of long helical polymer crystals. The ultimate result is the formation of coiled families of fibrillar crystals, which explains a good many of the physical characteristics of crystalline polymers, particularly the fact that in the spherulites the chains are known to be arranged tangentially. This paper provoked a great deal of controversy. Mr. C. W. Bunn was very doubtful if the physical evidence, particularly from electron microscopy, really justifies the theory of helical coiling, for which, in a perfectly symmetrical polymer, there is no apparent reason. Dr. L. R. G. Treloar also failed to see how helical structures of the size required by Dr. Morgan's theory could be formed.

Dr. G. Meacock (British Nylon Spinners, Ltd.) gave an account of the "Production of Fibres from 6,6-, 6,10- and 6-polyamides"; although the 6,6-polymer is somewhat less thermally stable than the other two, it has a higher melting point and greater strength at high temperatures. While all the polymers can be spun by similar methods to give similar fibres, the 6-polymer has the disadvantage of evolving its monomer during spinning, which complicates the process.

Dr. J. A. Chapman and Dr. J. W. Menter (University of Cambridge) then gave a brief account of some work they have been doing on the examination of fibre surfaces by reflexion electron microscopy. The micrographs exhibited show this to be a powerful method for observing the effect of frictional wear.

Cold-drawing and, in particular, 'necking' in fibres has until very recently been something of a mystery, which the authors of the next paper, "The Drawing of Terylene", by I. Marshall and A. B. Thompson (Terylene Council, Imperial Chemical Industries, Ltd.), have done much to clear up. Their paper was also illustrated by a fascinating film of the experimental drawing apparatus in action. By a consideration of load extension curves at various temperatures, the position of the draw point can be predicted; but complications arise owing to the crystallization of 'Terylene' during the process, and to necking. When necking takes place during the passage of the filament over a heated plate, the draw point only remains fixed relative to the plate over a fairly narrow range of draw ratios and temperatures; outside these limits, the draw point retreats to the feed roll or advances to the draw roll. The theoretical interpretation of these facts was given. During the discussion, Dr. H. T. Hookway commented on the relationship between second-order transition temperatures and temperatures at which necking could occur. Dr. D. V. N. Hardy mentioned a number of phenomena associated with the heat generated at the neck.

R. A. Horsley and J. Jack (B.X. Plastics, Ltd.) turned to the subject of vinylidene chloride copolymers, and gave details of the "Extrusion Properties of Saran Monofilaments". They described a commercial machine for extruding and stretching saran, and discussed various points of design. The effect on tensile strength, loop strength and elongation of variables such as distance between die and quench bath, stretch ratio, quench bath temperature and stretching temperature were given.

The symposium chairman on the third day was Mr. J. Wilson, director of the British Rayon Research Association. The first speaker was Dr. A. R. Urquhart (Shirley Institute, Manchester), who read a paper on "Cellulose Acetate as a Raw Material for Rayon Production". After giving a historical account of the development of 'secondary' acetate rayon, Dr. Urquhart went on to compare some of the properties of acetate with those of nylon, 'Orlon' and other synthetic fibres, with particular reference to subjective qualities such as drape and compliance; 'Terylene' and 'Orlon' staple fibres approach acetate and wool in these respects. The water absorption of acetate is lower than that of viscose, but higher than that of nylon, 'Terylene' or 'Orlon', which gives the latter fibres an advantage in rate of drying after washing; however, considerations of hygiene and comfort require that a fabric should be able to absorb a considerable amount of moisture, and rate of drying is really only a secondary consideration. A vigorous discussion was held on this paper, contributions being made by Dr. Corbiere, Dr. E. Kornreich, Mr. J. G. P. Baker and Dr. R. M. Lodge, and it was obvious that views on the comfort to the wearer of the various synthetic fabrics were somewhat divided; it was pointed out that the fabric construction is important, and that one outstanding property might for some purposes outweigh many other considerations.

Dr. T. H. Morton (Courtaulds, Ltd.), in his paper on "Textile Properties of Synthetic Fibres", also referred to the importance of those properties of a fabric which for assessment require a certain amount of subjective judgment, and in a detailed discussion graded various old and new fibres in a number of classes. All the established fibres have some good points and some properties which can be improved. It is not possible to say that one fibre is better than another, since they all have particular fields in which they are specially useful. Dr. Morton suggested that it will be a very long time before the 'perfect' fibre, having ideal properties in all respects, is produced. Nevertheless, the textiles obtainable using the present materials, alone or blended, cover a very wide range of properties. This paper also was followed by considerable discussion. In regard to dyeing hydrophobic fibres, the difference between what is possible and what is regarded as practical to the dyer was pointed out. The cohesion of cellulose fibres is dependent on secondary valency forces, some details of which were given by Dr. J. Mann and Dr. H. J. Marrinan (British Rayon Research Association) in their paper on "Hydrogen Bonding in the Crystalline Regions of Cellulose". The study of infra-red absorption changes on interaction of cellulose and heavy water enables stretching of the hydroxyl groups in the crystalline and amorphous regions to be observed independently. All the hydroxyl groups in the crystalline regions of regenerated and bacterial cellulose are found to be hydrogen-bonded, which rules out certain previously proposed crystal structures. Hydrogen bonds of types O—H . . . . O and also H . . . . O—H . . . . O are present in regenerated cellulose. Commenting on this paper, Dr. L. Valentine referred to regions in cellulose acetates and trimethyl cellulose found to be inaccessible to water vapour; such regions are presumably crystalline.

The static electrification of textile fibres is well known, and often troublesome. Prof. E. Darmois (Paris), in a résumé of work on this subject, pointed out that wool and silk become positively charged on rubbing, but polyvinyl chloride fibres ('Rhovyl') become negatively charged. A blend of 25 per cent polyvinyl chloride fibre and 75 per cent wool takes on no charge at all. Prof. Darmois outlined his theory of these effects.

The chairman, Mr. J. Wilson, summed up the symposium. He observed that a wide range of topics had been covered, some of which are individually worth a complete meeting for themselves, having regard to the large amount of work which is going on and to the vigorous discussions which were held, particularly on the subjects of crystallinity and the relationship between fibre and fabric properties.

THE WORKER IN INDUSTRY

INTRODUCING a joint paper presented to the annual conference of the British Institute of Management at Harrogate in 1953, K. H. F. Murrell, director of the ergonomics department of Tube Investments, Ltd., stated that the main contribution of the psychologist to industry would be in studying the effect of bad equipment design on the health and efficiency of workers on a long-term basis. This would include such factors as the posture, either seated or standing, which the equipment imposes on the worker, and which may follow either from the shape of the equipment or from the design of its controls; the actual methods by which work is done, such as the application of force in an unnatural position; and the conditions of heat or noise under which he has to work. Much of industry works below maximum efficiency because it has, through neglect of physiological principles, partly 'worn-out' its working force. The most important contribution of the psychologist might be summed up as attempting to answer various aspects of the question "What makes people behave as they do when confronted with a given situation and what can be done about it ?" Some of these aspects might be: What is a real incentive for people to work ? Why do people resist change ? Is there such a thing as fatigue in repetitive work or is it merely monotony or boredom ? What is the nature of skill in a particular task and how can it best be acquired ?

To be effective the research worker must be familiar with the worker on the job and, from his own experience, Murrell gave examples to show how good theoretical research had been ineffective because it had failed to take account of the actual work situation.

A. T. Welford, director of the Nuffield Unit for Research into Problems of Ageing in the University of Cambridge, described a closely connected series of studies on some problems of speed in human performance. Men of different ages from the twenties to the seventies were set to work at a task where they had to plot positions on a grid by moving a pointer. The older men were on average substantially slower than the younger, but the slowness was not due to slowness in moving the pointer; it was rather due to more careful and meticulous placing of it.

The same results appeared in several other tasks; an experiment was accordingly devised in which careful measurements were made of reaction times and movement times under conditions where they could be separated with certainty. A man doing a task sat in front of a panel of four lights. One of these came on and the operator had to move a lever in the corresponding direction as quickly as possible from a central point to an end stop and back again. As soon as he got back to the centre another light came on, and so on. When the results were examined it was found that the actual time moving did not increase but tended to fall with age. The time elapsing between a light appearing and the man beginning to move the lever did increase significantly. A further point with this was noticed, in that the oldest men, in their sixties, tended to fall slightly at the end stop. The older men appeared to be having difficulty in welding the out and back movements into a single whole. These experiments link with a number of other results to suggest an important general principle, namely, that it is the time taken over stationary portions of a manipulative task which are more deserving of attention. These tend to increase with certain types of fatigue.

Evidence would seem to be accumulating that it is not correct to think of a manipulative operation as consisting merely of a series of movements. It consists rather of a series of acts of perception either by the eyes or by touch or by sound which have to be translated into movement. It is the perception and translation by the central media of the brain which are the important components of the operation, and it is in terms of these that operators must be analysed for work study purposes if general results are to be obtained which apply more widely than to each individual operation studied.

Welford also said that, while relatively little interest has been shown by psychologists in training the industrial worker, there is great scope for further co-operation between experimenters and industry. One example of a study with important practical implications was the one carried out about four years ago by G. B. Gibbs, of the Medical Research Council. Gibbs studied the performances of men on a machine where the display-control relationships could be made easier or more difficult. He divided the men into two groups of equal ability and trained one, first on a relatively easy task, and then transferred them to one which was similar but in which the display-control relationships were more difficult. The other group were trained on the same two tasks but in the reverse order. The results showed clearly that the second group, after being trained on the difficult task, came to the easy one and performed it much better than they would have done if they had not had the previous difficult training. With the other group Gibbs found that the previous training on one easy task made no difference to their ability to perform the more difficult one.

Dr. H. D. Darcus, of the Climatic and Working Efficiency Unit of the Medical Research Council, stated that one of the possible approaches to the study of the activity of man at his work is to find out under what conditions the man may be allowed to work at his greatest physiological efficiency. Emphasis should be placed on the output of the man rather than the effort the man has to put in to achieve that output. This is probably acceptable in most work situations because the operator is only using a small proportion of his total capacity and he can be expected to do a little bit more without suffering physical harm. The load to which a man is subjected should be kept as low as possible to give him a reserve of effort, a reserve capacity. If that is done the problem of reduced capacity due to extremes of environmental conditions, hot climates, or due to disabilities or age, is not quite so acute because the load on the individuals working under those conditions or on the aged or disabled worker is still below their level of output.

What is the maximum capacity of the body for exercise? One approach has attempted to work out an endurance or tolerance limit, usually about 50 per cent of maximum capacity. When a person starts to work, physiological changes occur in the body, and these changes increase until a balance is struck between the energy he is putting out and his external work. He will go on using the same amount of energy for the same amount of external work, although not many people work at a steady rate. The endurance limit can be increased by training the individual to become physically fitter by acclimatization. One way to push the endurance limit up is to bring the load down, thereby reducing the effort to gain a given output. This endurance-level will fall with age, with certain disabilities and under extremes of temperature, and the safety level will become less and less.

This endurance limit is the maximum level at which a man can be expected to work over a period of time. During a long period of work, the energy output remains constant initially; but as time passes it is necessary to put out more energy because the efficiency of the muscles doing the job is becoming less and more muscles have to be used to produce the same result; more muscles demand more energy and the safety margin of effort becomes reduced. Provided this safety margin is not exceeded, the operator is paying as he goes; that is, he is getting sufficient oxygen to allow the energy for the muscles he is using. If this level of effort is exceeded, he no longer gets enough oxygen for his energy requirements. This condition can be maintained for a time; but the longer it goes on the bigger becomes the physiological debt. Another aspect of this is the use of rest pauses. In Great Britain it is usual to have a break in which the operators probably sit down. In Sweden, if work of a very cramped nature, such as sewing, tabulating or assembly, is being undertaken, they sometimes have Swedish drill, which is rather like organized ballet.

There is no one physiological method which will give an overall picture of man at work in all circumstances. If it is desired to use physiological methods for different measurements, the methods to be used for particular situations must be very carefully chosen, the results carefully integrated and finally interpreted with the utmost caution. The main difficulty at the present time is that these methods are mainly designed to investigate man working under extreme conditions, and these situations are very rare in industry.

The experimental approach is the one which will produce the best results, involving as it does formal scientific methods under controlled conditions. The first thing to do is to find out exactly what the problem is and then determine the main factors within that problem. One way of dealing with it is for research people to go out into industry with the industrialist to examine the problem and see if it really warrants research or if it can be dealt with by some other means. What is necessary is encouragement from industry itself, not so much on *ad hoc* problems, but for establishment of a long-term policy.

PROBLEMS OF AIRCRAFT NOISE

In reply to a question in the House of Commons on June 28, regarding progress in research by the Ministry of Supply into the silencing of aircraft engines, Mr. Duncan Sandys stated that work in this field is also being carried out by the Ministry of Transport and Civil Aviation and by universities and aircraft firms on their own initiative. In a detailed statement circulated in the Official Report, expenditure by the Ministry of Supply on this problem in the current year is given as £100,000 compared with £40,000 last year, and the Ministry of Transport and Civil Aviation is also expected to spend about £20,000.

The problem of reducing aircraft noise is being tackled from several angles. The main effort has been concentrated on jet engines. An extensive programme being carried out by a leading firm of engine makers, under contract by the Ministry of Supply, includes a detailed analysis of the noise of a jet engine operated with various alternative types of nozzle on an open-air test bed. The nozzles which are being tested include toothed, corrugated, convergent–divergent and fish-tail types. Promising results have been obtained from toothed and corrugated nozzles, and further studies are being made to decide the optimum shapes for these types. A special study of the by-pass engines in relation to the noise problem is being carried out, with the object of determining the relationship between noise, jet velocity and temperature. The effect on noise of injecting water into the jet stream is also being investigated.

Two other engine companies are working under Ministry of Supply contract on silencers for piston engines used in helicopters. The Ministry of Transport and Civil Aviation is experimenting with the construction of a brick baffle-wall at London Airport. This wall is shaped to accommodate the forward part of a large civil aircraft, with the object of reducing noise in certain directions when the engines are being run on the ground. Results are not yet entirely satisfactory, but the investigation is being continued. The Ministry of Supply has placed a contract for the design of two types of mobile ground mufflers, one suitable for single-engine aircraft and the other for multiple-engine aircraft. Experiments by a firm of aircraft manufacturers with portable screens, which are placed around the aircraft while the engine is being run up, showed some reduction of noise, and further screens are on order. A firm of consulting engineers is advising four other aircraft manufacturers on the use of specially designed pens for muffling the sound of aircraft the engines of which have to undergo running tests on the ground. Another firm, on its own initiative, is building a pair of mobile ground mufflers to its own design.

Tests being carried out by the College of Aeronautics, Cranfield, under Ministry of Supply contract, include the following: the measurement of thrust and noise-levels of engines with nozzles fitted with noise-reduction devices of various designs; the measurement of the sound field from small jets at supersonic speeds, combined with schlieren investigations; and the measurement of the turbulence structure in the mixing region at the jet exit, both at low and high speeds. Laboratory work being carried out at the University of Southampton, which is supported by the Ministry of Supply, includes the development of a shock tube for recording the interaction between an eddy and a shock wave; the development of an optical eddy-counting technique, including a focusing device; the measurement, by means of the hot-wire technique, of turbulence, velocity and temperature distribution along the jet; the examination of noise from jets of non-circular shape; and the study of noise emitted from special jet extensions, with annular corrugated orifices, designed to reduce low-frequency noise. Important fundamental research on the origin and nature of jet noise is also proceeding at the Universities of Manchester and Edinburgh.

The problem of aircraft noise was also debated in the House of Lords on July 7, when, for the most part, the question of legislation and responsibility for minimizing noise was discussed. Lord Hawke said that perhaps the most hopeful line of approach is in experiments with devices which act upon the gas when it leaves the jet and provide something in the nature of a gigantic exhaust box.

PHYSICAL SOCIETY

ANNUAL REPORT FOR 1953

At the annual general meeting of the Physical Society, held at the Royal Institution, London, on May 25, the reports of the council and of the honorary treasurer and the accounts and balance sheet for 1953 were presented and adopted. During the year the membership rose by 29 to 2,130, and the sale of publications continued to increase both at home and abroad. The new scheme of subscriptions which came into operation on January 1, 1953, by which subscriptions for publications are separated from the subscriptions for membership, has worked smoothly and appears to be serving better the needs of members. There has also been a steadily growing interest in the reprint service which was introduced at the same time. The treasurer's report shows that any loss of income resulting from the lowering of the Fellows' subscription from three to two guineas has been more than compensated for by the increased income from the sale of publications of the Society. The cost of the provision of *Science Abstracts*, now no longer provided to members, was reduced from approximately £2,500 to £500. The income accruing to the Society as a result of the publication of the "Handbook of Scientific Instruments and Apparatus", the catalogue of the Society's 1953 exhibition of scientific instruments and apparatus, was considerable, amounting to nearly £4,000, and the balance of income over expenditure for the year was £1,794.

In addition to five science meetings held in London during the year, two-day meetings were held at the University of Leeds during March 31–April 1, and at King's College (University of Durham), Newcastle upon Tyne, during July 13–14; a conference on ionization phenomena in discharges, sponsored jointly by the Electrical Research Association, the Institute of Physics and the Physical Society, was held at the Clarendon Laboratory, Oxford, during July 18–23. The thirty-seventh Guthrie Lecture was delivered by Prof. Max Born, who spoke on the conceptual situation in physics and its prospects of development. The eighth Holweck Medal of the Société Française de Physique and the Holweck Prize of the Physical Society were presented to Mr. J. A. Ratcliffe in Paris in May, when Mr. Ratcliffe delivered the Holweck Discourse on the subject of diffraction of radio waves by the ionosphere. Prof. J. Bartels, of the University of Göttingen, received the seventh Charles Chree Medal and Prize on October 23, and for his address described Chree's influence on present-day geophysics. The thirtieth Duddell Medal was presented to Prof. W. Sucksmith, who gave a talk on "Some Magnetic Measurements—Techniques and Applications", and the ninth Charles Vernon Boys Prize to Prof. F. C. Williams, who spoke on "Cathode-Ray Tube Storage for Digital Computers".

Brief details of the activities of the four Groups of the Society, the Colour, Optical, Low Temperature and Acoustics Groups, together with a list of the numerous bodies on which the Society is represented, are given in the annual report. The activities of the Groups were not so varied as in former years, though the usual science meetings and summer meetings were held. The expenditure of the Groups fell markedly during the year, and, although the expense of the Groups to the Society was thus less than usual, it is emphasized that this is not a healthy sign since the activities of the Groups are vital to the welfare of the Society and any financial commitment entailed in their activities is more than offset by the contribution made by the Groups to the well-being of the Society.

At the annual general meeting the officers and council of the Society for 1954–55 were elected as follows: *President*, Prof. H. S. W. Massey; *Vice-Presidents in addition to ex-Presidents*, Mr. J. H. Awbery, Dr. R. C. Evans, Dr. A. B. Wood and Prof. S. Devons; *Honorary Secretaries*, Dr. C. G. Wynne, Dr. H. H. Hopkins; *Honorary Foreign Secretary*, Prof. E. N. da C. Andrade; *Honorary Treasurer*, Mr. A. J. Philpot; *Honorary Librarian*, Dr. R. W. B. Pearse; *New Ordinary Members of Council*, Dr. T. E. Allibone, Dr. A. H. Cooke, Prof. F. C. Frank and Prof. G. O. Jones.

ARTIFICIAL AND NATURAL COLORATION OF DIAMONDS

Most diamonds in their natural state are coloured; but the origin of the colour is still largely a mystery. There is little evidence that it is due to impurities, nor is it clear as to whether the colour is generally confined to the surface or distributed throughout the diamond, though in some cases, usually diamonds coloured yellow or yellow-green, the colour has been reduced or removed by polishing and grinding the surface. The colour has then been attributed to natural radioactivity. In 1923, S. C. Lind and D. C. Barwell established that diamonds were coloured green by bombardment with alpha-particles from radium, and there have been several reports during the past decade of the colouring of diamonds by proton and deuteron bombardment, though beta-, gamma- and X-rays seem to have little or no effect. The evidence suggests that diamonds are more readily coloured by energetic heavy particles. This supports the theory that the colour centres are connected with the vacant lattice sites and interstitial atoms formed when the bombarding particles collide with the carbon atoms of the diamond lattice.

A recent study by R. A. Dugdale of the effect of neutron bombardment of diamonds in the Harwell pile BEPO and of high-energy electron bombardment and of subsequent heat treatment confirms this view

(*Brit. J. App. Phys.*, 4, 334; 1953). The pile radiation induced a green colour which deepened as the irradiation proceeded until the diamond actually became opaque, usually after about one week of irradiation. The changes in the absorption and fluorescence spectra which occurred on subsequent heating of the irradiated diamonds to various temperatures up to 1,000° C. were studied visually, using a simple glass-prism spectrometer, and twenty-one specimens were examined in some detail. The effect of heating five natural green diamonds was also studied. Their general behaviour was similar to the irradiated specimens. Some twenty small blue-fluorescing colourless diamonds were coloured by bombarding them with electrons of ½, 1 and 3 MeV. energies, and the 3-MeV. bombarded specimens on subsequent heating behaved in much the same way as those coloured in the pile.

In the discussion of his observations, Dugdale refers to Seitz's statement that about 25 eV. recoil energy is needed for a carbon atom in diamond to be displaced, by bombardment, from its normal lattice site to an interstitial site, and estimates that 0·001 per cent of the atoms in diamond become Frenkel defects in a ten-hour irradiation in the pile. The plausible explanation advanced is that the green colour is associated with the lattice defects, and subsequent heating produces some mobility of the defects with some recombination and thus some reduction in the intensity of the colour.

ALLOY JUNCTION TYPE OF TRANSISTOR

A SPECIAL article entitled "New Advances in the Junction Transistor", by E. W. Herold, of the R.C.A. Laboratories Division, Princeton, N.J., which is printed in the April issue of the *British Journal of Applied Physics* (5, 115; 1954) will be of particular interest to solid-state physicists and to electronic engineers. The article is based on a lecture delivered by Mr. Herold in London on October 20, 1953, and in it a survey is given of recent research conducted in the United States into the alloy junction type of transistor which is now likely to supplant the older point-contact form. Taking as an example n-type, single-crystal germanium with indium as impurity, Mr. Herold describes first the various steps in the formation of a transistor junction where a technique involving alloying is utilized. A piece of indium is placed on the germanium, and the temperature is raised until the indium melts. On heating further the molten indium becomes saturated with germanium, and then, when the temperature is lowered, the germanium crystallizes out into indium-contaminated p-type form. The position and shape of the junction formed are, in principle, closely controllable by variation of the contact area between the p-type germanium and the n-type base, the volume of indium and the maximum firing temperature; but, in practice, surface wetting is a possible variant which must also be controlled.

The p–n–p alloy junction transistor made by using two junctions on opposite sides of a thin germanium wafer is considered next, and its performance is discussed in terms of the current amplification factor α. The effects of the geometry, surface combination and emitter current injection on α are separately analysed, and the high-frequency limitations and the equivalent circuit of the junction transistor are described in some detail. It is shown that the chief factors limiting frequency response can be reduced in magnitude in an improved p–n–p radio-frequency amplifier transistor, the details and dimensions of which are given, and which are compared with the earlier type *TA*153. Measured values show that the base-lead resistance is reduced by 5, the barrier capacitance by 3·5 and the diffusion capacitance by about 20 times, but the resistance between collector and base is less than that of the type *TA*153 transistor. Hence, α remains about the same with partial sacrifice of low-frequency gain but with great improvement in high-frequency performance. The improved form of transistor has an upper oscillation limit between 40 and 75 Mc./s.

Finally, an experimental all-transistor personal broadcast set using six of the new radio-frequency transistors and three other transistors is described. It is smaller in size than the battery-operated all-valve receiver sold in the United States under the designation 'personal portable', has about twice the audio-frequency output power and runs off a battery consisting of six ordinary flashlight cells lasting 500 hours.

MEASUREMENT OF ELECTRODE POTENTIALS IN LIVING AND DEAD TISSUES

By DR. D. B. CATER and DR. A. F. PHILLIPS

Departments of Pathology and Radiotherapeutics,
University of Cambridge

IN the course of an investigation of the effect of oxygen on tumour tissue, a method has been developed for measuring platinum electrode potentials in tumours and normal tissues. Using rats bearing either Walker carcinoma 256 or Jensen sarcoma, definite potentials are obtained which respond in characteristic ways to various experimental procedures, such as the administration of oxygen, or the injection of 2-methyl 1:4-naphthohydroquinone diphosphate ('Synkavit')[1]. Different methods of killing the animal result in markedly different and characteristic changes in the electrode potentials.

The electrodes consist of fine platinum wires, insulated by a coating of 'Araldite 985E', supplied by Aero Research, Ltd., Duxford, Cambs. A bevel is ground at the end, and this is scraped clean with a glass knife to produce a bright platinum surface of small dimensions. Cemented alongside the wire, leaving 1 cm. projecting, is a short plastic guide tube, through which can be passed a modified hypodermic needle having a bevel 1 cm. long. The hypodermic needle is used to guide the wire into the tissues, after which the needle is withdrawn, leaving the electrode *in situ*. The electrodes can be sterilized by boiling, and are suitable for insertion into animal or human tissues with a minimum of trauma. Small silver – silver chloride electrodes are used to complete the circuit; it does not make any difference into what tissues these are inserted. Simultaneous measurement with a glass electrode records any changes of pH. Glass electrodes of capillary form have been used, both made by us using the method of Voegtlin *et al.*[2] as modified by Kahler and Robertson[3], and as supplied by the Cambridge Instrument Co., Ltd. The impedance of these ranges from 2 to 10 × 10^8 ohms.

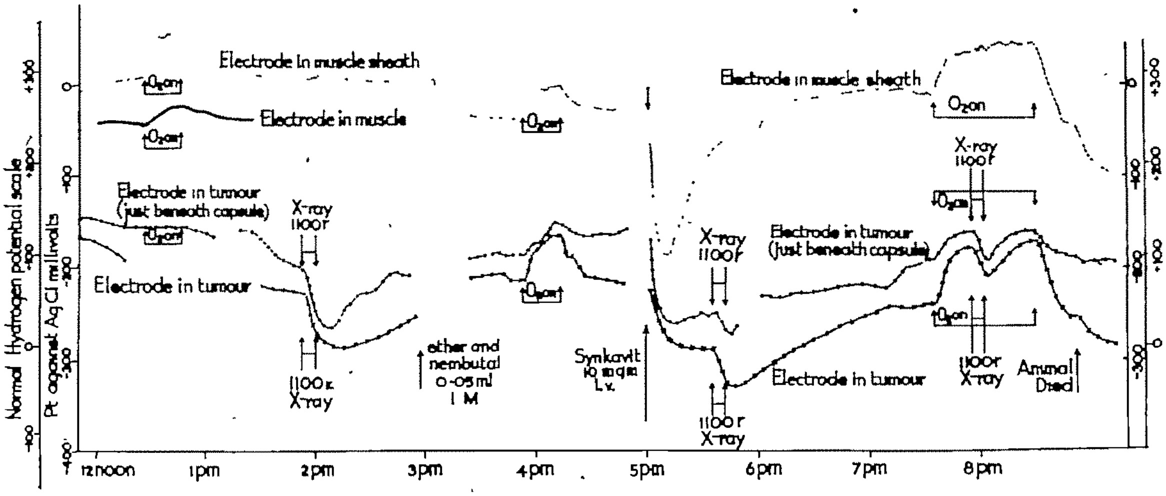

Fig. 1. Effect of oxygen, 'Synkavit' and X-rays, alone or in combination, on platinum electrode potentials in Walker carcinoma

The potentials are measured with an electrometer valve circuit, slightly modified from DuBridge and Brown[4]. The measurement is by a null method, in which the potential difference can be balanced to within 1 mV. in the four ranges 0 to ± 0·5 V. and 0 to ± 1 V. The input impedance is 5 × 10^{11} ohms, which is high enough to prevent polarization even when the potentiometer is temporarily out of balance. By attention to proper insulation and earthing it is possible to take readings with each type of electrode during experimental procedures, including irradiation by means of a 220-kV$_p$. X-ray generator. Complete electrostatic shielding of the animal has not been found essential.

In some experiments two platinum electrodes and a glass electrode are inserted into the tumour and one platinum electrode into muscle. Each electrode is connected to a separate co-axial cable. About four readings a minute can then be taken, which makes it possible to study the changes of potential at the four different electrodes. Fig. 1 shows a typical experiment. Note (1) the rise in electrode potential when the animal breathes oxygen, (2) the marked fall in potential, followed by slow recovery, after intravenous injection of 'Synkavit', (3) that X-rays (1,100 r. at 220 kV$_p$.) cause a fall in potential at the irradiated electrodes in the tumour, with no change at the non-irradiated electrode in muscle. A second dose of X-rays after 'Synkavit' still results in a potential drop, but oxygen administered during a third dose of radiation increases the speed of recovery.

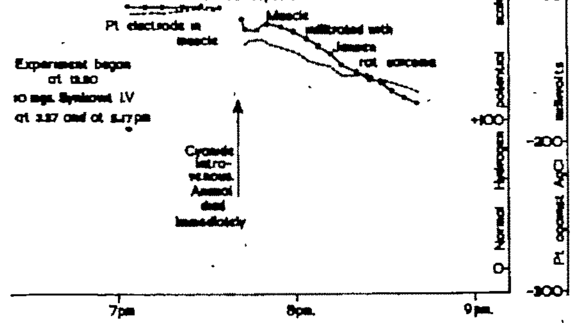

Fig. 2. Effect of death by cyanide on platinum electrode potentials

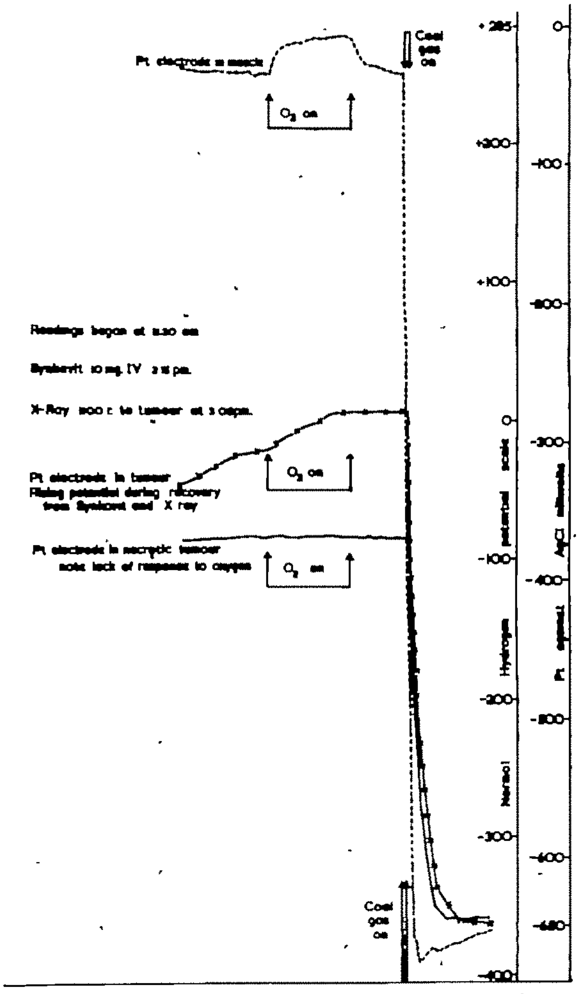

Fig. 3. Effect of death by carbon monoxide on platinum electrode potentials

Fig. 2 shows that when the animal is killed by intravenous injection of cyanide, the electrode potentials remain practically unchanged for 10 min. and then fall very slowly. Death from ether gives a similar slow fall. Compare this with the rapid fall of potential which occurs at all electrodes after death from coal gas as shown in Fig. 3.

The pH changes recorded by the glass electrode are small and cannot account for the large changes of potential at the platinum electrodes.

The exact meaning of the electrode potentials described here may be difficult to interpret. Preliminary experiments have been made to follow changes of oxygen tension by measuring the current flowing through one of the platinum electrodes when a suitable negative potential is applied[5]; these suggest that our measurements of electrode potentials are not merely dependent upon tissue oxygen tension. We are working upon the hypothesis that the potentials are closely related to the oxidation-reduction potentials of one or more of the respiratory enzymes of the tissue, and to the substrate potentials in the case of coal gas poisoning.

Our thanks are due to Prof. J. S. Mitchell for advice and encouragement, to Mr. R. Stearn for expert technical assistance, and to the Corning Glass Works for supplying us with Corning 015 glass. One of us (D. B. C.) acknowledges a British Empire Cancer Campaign research fellowship, and the other (A. F. P.) a Beit Memorial fellowship.

A NEW METHOD FOR THE COLORIMETRIC ESTIMATION OF AMINO-ACIDS ON PAPER CHROMATOGRAMS

By F. A. ISHERWOOD

Low Temperature Station for Research in Biochemistry and Biophysics, University of Cambridge and Department of Scientific and Industrial Research

AND

D. H. CRUICKSHANK

Botany School, University of Cambridge

A SHORT review of many of the earlier published methods for the estimation of amino-acids on paper chromatograms has been given in a paper by Thompson, Zacharius and Steward[1].

The present method was required, in the first instance, in connexion with experiments on the reaction between amino-acids and keto-acids in the presence of trans-aminase enzymes from wheat and barley. The amino-acids under consideration were glycine, alanine, phenylalanine, and aspartic and glutamic acids; because of this, investigation of the present method has been limited largely to these amino-acids, though it is clearly capable of a much wider application, especially in connexion with the science of food and nutrition.

The principle of the method is that the amino-acids are quantitatively converted on the paper into their yellow 2 : 4-dinitrophenyl (DNP) derivatives by treatment with 2 : 4-dinitro-fluorobenzene (DNFB), and these derivatives serve both to locate the position of the amino-acid and as a basis for the subsequent colorimetric estimation. The absorption spectra of the various dinitrophenyl amino-acids are very similar. However, treatment of the amino-acid on the paper with the large excess of dinitro-fluorobenzene necessary to ensure complete conversion to the corresponding dinitrophenyl derivatives results in the formation of a large excess of 2 : 4-dinitrophenol, which seriously interferes with any simple colorimetric estimation of the dinitrophenyl amino-acids. The present method, in fact, hinges on the discovery that the latter can be separated from dinitrophenol by dissolving the mixture in 91 per cent w/w sulphuric acid and extracting the dinitrophenol with benzene. In this strongly acid medium the dinitrophenyl amino-acids ionize as mono-acid bases and are insoluble in benzene. At lower concentrations of sulphuric acid the dinitrophenyl amino-acids are present in the normal un-ionized form and can be readily extracted with organic solvents. In practice, after the removal of the dinitrophenol, the solution of the dinitrophenyl amino-acid in 91 per cent sulphuric acid is diluted to 30 per cent and extracted with a mixture of *tert.* amyl alcohol and benzene. The dinitrophenyl amino-acid is finally transferred to an aqueous solution of sodium bicarbonate for colorimetric estimation.

The discovery of a method by which dinitrophenyl amino-acid can be separated from dinitrophenol is important even apart from the present study. The method has been used[2] to effect a clean separation of dinitrophenyl glycine from the hydrolysis products of casein which had been treated with dinitrofluorobenzene. Certain impurities which could not otherwise be removed were separated by dissolving the crude dinitrophenyl glycine obtained by the Sanger method[3] in 91 per cent w/w sulphuric acid and following the procedure described later.

Chromatographic separation of the amino-acids. These were separated on paper chromatograms, the apparatus and general conditions of development being substantially the same as those described for the phosphoric esters[4]. Two solvent systems were used. A single-phase mixture of *n*-propanol–water (80 : 20 vol.) was used for the mono-amino monocarboxylic amino-acids and a mixture of *n*-propionic acid – *tert.* butanol – water (60 : 30 : 10 vol.) for the separation of the two dicarboxylic amino-acids. The distances travelled by glutamic and aspartic acids and alanine on Whatman No. 1 paper in 15 hr. with these two solvents were 2·0, 1·3, 8·8 and 11·8, 8·0, 18·6 cm., respectively.

The solvent was removed from the chromatogram by hanging the paper in a current of air for 3–4 hr.; in the case of the second solvent, the last trace of *n*-propionic acid was removed by steaming the papers for a short time. Experience has shown that cellulose adsorbs a number of compounds such as *n*-propionic and acetic acids and phenol very tenaciously, and even long drying at 100° will not remove them. In the presence of water vapour, however, they are readily displaced from the paper.

The filter paper was chromatographically washed[4] to remove soluble impurities. Each paper was washed separately with 2 N acetic acid, water and 10 N ammonia. Tests have shown that this gives the most

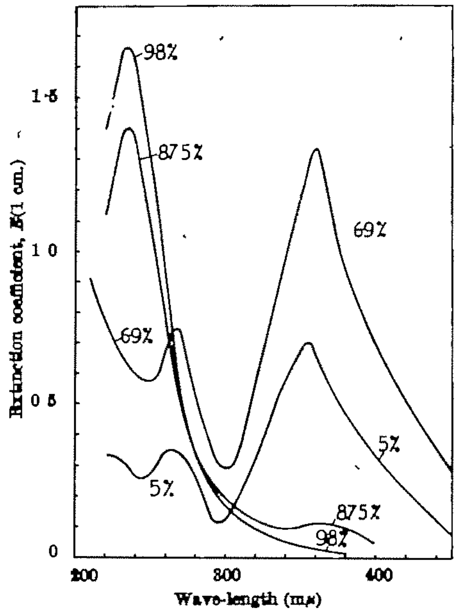

Fig. 1. Absorption spectra of dinitrophenyl glycine in various concentrations of sulphuric acid. Concentration of dinitrophenyl amino-acid, $M \times 10^{-4}$

satisfactory results. Washing filter papers[4,5] in the form of a pad does not seem so reliable, and it may be that the washing liquid tends to run through the capillary spaces between the papers rather than through the papers themselves.

Conversion of the amino-acids to their dinitrophenyl derivatives. The equivalent of 3–5 μl. of a 0·02–0·001 *M* solution of the amino-acid under investigation (in experiments on enzymes the total concentration of all amino-acids might be much larger) was present on the chromatogram. This was sprayed, as evenly as possible, at the rate of 5 ml. per 100 $cm.^2$ with a freshly prepared solution of dinitro-fluorobenzene in alcohol containing a borate buffer. An all-glass throat spray was used and the operation was carried out under a hood. The solution contained 0·06 gm. dinitro-fluorobenzene, 33 ml. of ethanol and 17 ml. of 0·2 *M* borate buffer *p*H 8·4 except in the case of the two dicarboxylic acids, when a 0·2-*M* borate buffer *p*H 10·0 was used. The amount of dinitro-fluorobenzene on the paper represented about 40 equivalents of amino-acid at the highest concentration at which they were applied to the paper (0·02 *M*). The reaction proceeded slowly in the cold but was very rapid at temperatures of 50–100° C. The recommended method is to heat the papers after spraying in a closed water-jacketed oven[4] at about 80° C. for 30 min., though successful results were obtained if the sprayed papers were left overnight in the dark at room temperature.

The detection of the amino-acid spots on the chromatogram was normally easy; but if the amount of amino-acid was very small, the paper was bleached by exposure to hydrogen chloride gas. The background colour, which was usually a pale yellow, was changed to white, and the dinitrophenyl amino-acids remained as orange-yellow spots. The limit of detection is about 0·0005 *M* calculated in terms of the concentration of the solution applied to the 'starting line' of the chromatogram.

Separation of dinitrophenol from dinitrophenyl amino-acids. This is effected by dissolving the mixture in strong sulphuric acid and extracting the dinitrophenol with benzene. The dinitrophenyl amino-acids are ionized in this medium and are not soluble in benzene.

The concentration of sulphuric acid which would cause the ionization of dinitrophenyl amino-acids but not of dinitrophenol was determined by a study of the absorption spectra of the dinitrophenyl amino-acids in various strengths of sulphuric acid. The simple fact that most organic acids and bases have absorption spectra which differ materially from those exhibited by the corresponding anions or cations means that the ionization can be followed by the change in absorption spectrum[6]. In Fig. 1 is shown the absorption spectra of dinitrophenyl glycine in 5, 69, 87·5 and 98·4 per cent (w/w) sulphuric acid, and in Fig. 2 that of dinitrophenyl phenylalanine in 69, 88 and 91 per cent (w/w) sulphuric acid. Inspection of the curves for dinitrophenyl glycine shows that the general appearance is the same in concentrations of sulphuric acid from 5 to 69 per cent, the change in the medium altering the extinction coefficient at all wave-lengths to much the same extent. In 98 per cent (w/w) sulphuric acid the dinitrophenyl glycine is almost certainly completely ionized, and it is significant that the absorption spectrum is very different from that in 69 per cent (w/w) sulphuric acid. In concentrations of acid between 69 and 98 per cent the absorption spectrum changes markedly, and this rapid change must be attributed to the presence in solution in varying amounts of two substances, one of which has an absorption curve like that in 69 per cent (w/w) acid and the other like that in 98 per cent (w/w) acid. Assuming the latter is due to the ionized form, a rough calculation based on the extinction coefficients at 350 mμ suggests that in 87·5 per cent acid at least 88 per cent of the dinitrophenyl glycine is ionized, and in 91 per cent acid at least 95 per cent: dinitrophenyl phenylalanine (Fig. 2) behaved similarly.

Examination of dinitrophenol under similar conditions showed that there was only slight ionization in 87·5 per cent w/w sulphuric acid, and even at

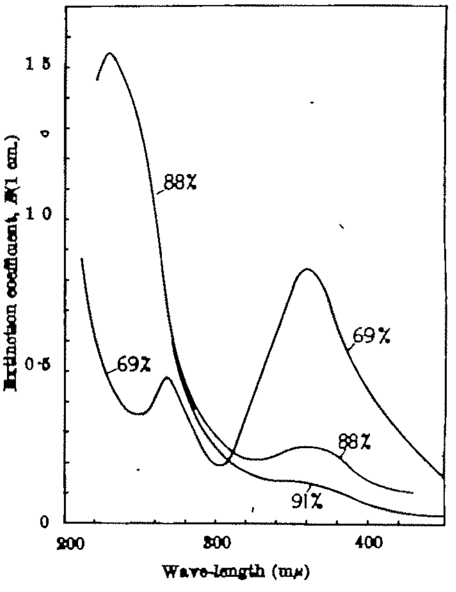

Fig. 2. Absorption spectra of dinitrophenyl phenylalanine in various concentrations of sulphuric acid. Concentration of dinitrophenyl amino-acid, $M \times 10^{-4}$

91 per cent it was not sufficient to interfere with the benzene extraction.

The theoretical treatment of the ionization is complicated by the fact that the dinitrophenyl amino-acids can ionize in two different ways. It is of interest that both benzoic and phenyl acetic acids are slightly stronger bases than dinitrophenyl glycine in sulphuric acid.

Recommended procedure. The analytical procedure based on the observations described above was as follows.

The piece of paper containing the dinitrophenyl amino-acid was cut from the chromatogram and then eluted with a solution containing 5 ml. of 0·2 *M* borate buffer (*p*H 8·4) and 10 ml. of alcohol. The extract (0·5 ml.) was collected in a standard test-tube (15 cm. × 1·5 cm.). Practically all the subsequent operations were carried out in this test-tube to avoid the losses which occur if solutions are transferred from one vessel to another. The alcoholic extract in the test-tube was evaporated to dryness by blowing a stream of cold air into the test-tube, and to the residue was added 1 ml. of 91 per cent (w/w) sulphuric acid. The test-tube was shaken for a few seconds until the dinitrophenyl amino-acid had dissolved. The solution was then shaken with 3 ml. of purified benzene for 3 min. A mechanical shaker (the 'Microid' shaker, by Baird and Tatlock, is suitable for this purpose) was used, and it was essential to obtain a thorough mixing of the two layers without the shaking becoming so violent that liquid was ejected from the tube. After standing for 5 min., the two phases completely separated and the benzene layer was sucked into a pipette with a fine tip, care being taken not to remove any of the sulphuric acid layer. The extraction was repeated five times. (The benzene used was purified by shaking it repeatedly with fresh 98 per cent (w/w) sulphuric acid until the acid layer was no longer coloured, washed with water and dried over sodium sulphate.) The solution of dinitrophenyl amino-acid in the 91 per cent (w/w) sulphuric acid was now free from dinitrophenol.

To recover the dinitrophenyl amino-acid, the acid layer was diluted to about 30 per cent by the addition of 2 gm. crushed ice and then extracted with an organic solvent. During the addition of the crushed ice, the test-tube was immersed in an ice–alcohol cooling-bath and shaken until the ice had dissolved. Tests showed that the temperature did not rise above − 6° at any time, and under such conditions no destruction of dinitrophenyl amino-acids took place. Without external cooling, the temperature may rise 40°–50° momentarily. When the ice had dissolved, the solution was removed from the cooling-bath. The dinitrophenyl amino-acid was then extracted by shaking with 3 ml. of 10 per cent (v/v) *tert.* amyl alcohol in benzene (the dinitrophenyl derivatives of most amino-acids are soluble but that of phenylalanine is best extracted with 5 per cent alcohol) and allowed to stand 5 min. The clear upper layer was carefully sucked up into a pipette and the extraction repeated twice. The combined extracts were then shaken with 1 ml. of a saturated aqueous solution of sodium bicarbonate and allowed to stand. 0·5 ml. of the clear aqueous layer was run into a 1-cm. glass micro cell and the extinction coefficient measured using a Hilger photoelectric colorimeter at either 3650 A. or 4047 A. Since the absorption spectra of the different dinitrophenyl amino-acids varied slightly, the reading was compared against that for a standard solution of the pure crystalline dinitrophenyl amino-acid dissolved in aqueous sodium bicarbonate. Blank readings were obtained by extracting an area of the paper close to those actually cut out for the estimation of the dinitrophenyl amino-acids. Such readings were never more than 2–4 per cent of those for the dinitrophenyl amino-acids and were probably due to impurities in the benzene and incomplete extraction of the dinitrophenol.

The above procedure has been applied successfully to the estimation of a number of mono-amino monocarboxylic acids and to aspartic acid. In the case of glutamic acid, the method was modified because dinitrophenyl glutamic acid is unstable in the presence of 91 per cent (w/w) sulphuric acid at room temperature. The modified method is as follows:

The dinitrophenyl glutamic acid was prepared and extracted from the paper chromatogram as described above. The dried alcoholic extract was then dissolved in 1 ml. of 91 per cent (w/w) sulphuric acid which had previously been cooled to − 12° C. in an ice–alcohol bath. The solution was extracted as described previously, with 3 ml. of a mixture of 30 per cent (v/v) purified toluene in purified benzene, the test-tube being immersed in an ice–alcohol cooling-bath throughout all the operations. The toluene was purified in the same way as the benzene. The mixture of toluene and benzene was used because, unlike benzene, it does not freeze at the temperature of extraction (− 12° C.). The extraction was repeated five times, working as quickly as possible and avoiding too vigorous shaking. To the acid layer was then added 2 gm. of crushed ice and the mixture shaken vigorously while still in the cooling-bath. As soon as the ice had dissolved, the test-tube was removed from the cooling-bath and the dinitrophenyl glutamic acid extracted with 10 per cent (v/v) *tert.* amyl alcohol–benzene as described previously.

Effect of light on the dinitrophenyl amino-acids. Light has been shown[7] to cause their destruction under certain conditions, and it was of interest to determine whether it had any effect in the present method. The result of experiments carried out in one case in direct sunlight and in the other in weak daylight are given in Table 1.

Table 1. EFFECT OF LIGHT ON THE ESTIMATION OF GLYCINE
Chromatograms developed with *n*-propanol–water (80 : 20 vol.) for 15 hr. Whatman No. 1 paper

Concentration of glycine applied to paper (3·03 μl.) (*M*)	Extinction coefficient (*E*, 4047, 1 cm.)		
	Solution of dinitrophenyl glycine equivalent to glycine added to paper	Solution from chromatogram in dim light	Solution from chromatogram in sunlight
0·04	1·32	1·027	0·963
0·02	0·66	0·64	0·481
0·01	0·33	0·32	0·210
0·005	0·165	0·165	0·111
0·0025	0·082	0·080	0·041
0·00125	0·042	0·041	0·012

It is clear from these figures that light has a harmful effect. The practice adopted for the final procedure was to shade the solvents and papers containing the dinitrophenyl amino-acids from strong light and, if convenient, to work in artificial light. The precautions need not be excessive, and by working in the absence of strong daylight no loss from this cause was detected.

Recovery of amino-acids. Quantities of the order of 6 μgm. (as 3 μl. of 0·02 *M*) of alanine can be estimated to within ± 5 per cent and the range of the method is from 0·5 µgm. to 20 µgm. The concentration of the amino-acid applied to the paper should not exceed 0·02 *M*, because at higher concentrations the reaction with the dinitro-fluorobenzene reagent does not give a quantitative yield of the dinitrophenyl amino-acid (cf. Table 1, concentration 0·04 *M*). Glycine, glutamic acid, aspartic acid, proline and phenylalanine give similar recovery figures to alanine.

Several workers have suggested that there is a loss of amino-acid depending on the distance travelled by the spot on the chromatogram[8,9]. Experience in the present study did not support this suggestion, though it must be emphasized that washed paper was used, and it may be that a compound is present in the unwashed paper which inhibits complex formation when using the copper method of assay. It is possible that the amino-acid can react with the dinitro-fluorobenzene reagent even in the presence of the inhibitor, whereas it may be less capable of forming a complex with copper. The shape of the spots on a paper chromatogram developed with *n*-propanol–water (80 : 20 vol.) was very much better if the paper had been washed. The outline of the spots was more nearly circular, and there was an absence of the forward-running shadow which is often present if ordinary Whatman No. 1 paper is used. It is significant that the recovery of phenylalanine, which has a high R_F value, and might be expected to show the maximum loss due to adsorption by the paper or combination with impurities, was of the order of 98 per cent.

So far as one of us is concerned (F. A. I.), the work described in this paper was carried out as part of the programme of the Food Investigation Organization of the Department of Scientific and Industrial Research. The other (D. H. C.) is indebted to the University of Adelaide for a grant and to Prof. G. E. Briggs for the hospitality enjoyed while working in his department. [March 4.

A PAPER CHROMATOGRAPHIC METHOD FOR THE QUANTITATIVE ESTIMATION OF AMINO-ACIDS

By Dr. ANTHONY L. LEVY

Hormone Research Laboratory, University of California,
Berkeley, California

A NEW method for the quantitative microanalysis of amino-acid mixtures has been developed, based upon the conversion of the amino-acids to their yellow N-2 : 4-dinitrophenyl (DNP) derivatives[1], followed by the separation of these compounds on a two-dimensional filter-paper chromatogram, and their subsequent quantitative elution from the paper and estimation at 360 mµ.

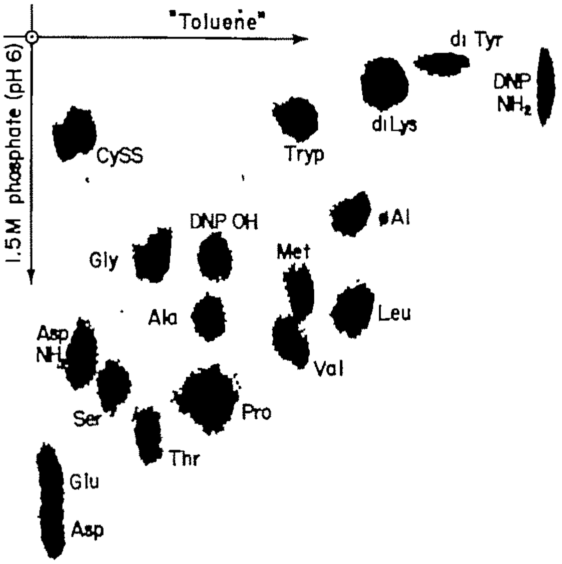

Fig. 1. 2-Dimensional chromatogram of a synthetic mixture of dinitrophenyl amino-acids (approx. 0·03 µ*M* of each)

Dinitrophenylation is effected quantitatively by stirring an aqueous solution of the amino-acid (20–30 µ*M* in 3 ml.) with a slight excess of 1-fluoro-2 : 4-dinitrobenzene (FDNB) for 30 min. at *p*H 9· and 40°, the *p*H being maintained at this valu throughout this period by intermittent additions o standard alkali; a Jacobsen–Léonis[2] autotitrator i particularly convenient for this purpose. Exces fluoro-dinitrobenzene is then extracted with ether the solution acidified, and the dinitrophenyl amino acids extracted into ether (5 × 5 ml.). The aqueou solution, which contains dinitrophenyl arginine an α-dinitrophenyl histidine, is diluted to 10 ml. A 2-ml. aliquot of the ether solution and a 1-ml aliquot of the water solution are next applied t adjacent corners of an 18¼ in. × 22¼ in. sheet o Whatman No. 1 filter paper, which is then irrigate by the ascending procedure with the toluene – chloro ethanol – pyridine – 0·8 *N* ammonia (modified t 5 : 3 : 1·5 : 3) mixture of Biserte and Osteux[3]. Th chromatogram is dried for 3–4 hr. at 40°, and th spots due to dinitrophenyl arginine and α-dinitro phenyl histidine excised at this point. The paper i then run in the second dimension by the descendin procedure with 1·5 *M* aqueous phosphate buffe (M NaH$_2$PO$_4$ + 0·5 M Na$_2$HPO$_4$) as irrigating flui to give the chromatographic pattern shown in Fig. 1 All the ether-soluble dinitrophenyl amino-acids ar thereby separated, except dinitrophenyl leucine an *iso*leucine. The positions of dinitrophenyl tryptopha and di-dinitrophenyl histidine coincide, but this doe not present a difficulty in practice since the forme amino-acid is not normally present in acid hydro lysates, and the latter is determined as its mono dinitrophenyl derivative.

The spots are cut out and dropped into a set o labelled test-tubes; three blanks are also cut fro each sheet. 4 ml. of water is pipetted into each o the tubes, which are then placed in a water-bath a 55–60° for 15 min. to allow complete elution of th colour. After an additional 15 min. to allow th solutions to cool to room temperature, they ar successively decanted into a 1-cm. quartz cuvett and the optical densities at 360 mµ (385 mµ in th case of dinitrophenyl proline) read in the Beckman model *DU* spectrophotometer against a water blank. The optical density reading of the tubes containing blank paper is 0·001–0·002 per sq. cm., and the appropriate corrections are made for each spot according to its estimated size.

The resulting ratios of the optical densities of the dinitrophenyl amino-acids are converted to molar ratios by multiplying by the following factors, which, within the accuracy of the method (± 4 per cent), are independent of the composition of the mixture analysed: Asp, 0·99; Glu, 0·94; CySS, 0·56; Ser, 0·97; Thr, 1·02; Gly, 1·03; Ala, 1·09; Pro, 0·93; Val, 0·99; Met, 1·21; Leu and *iso*Leu, 1·10; Phe, 1·03; Tyr, 1·54; Lys, 0·64; His, 1·62; Arg, 1·06. When the chromatograms are run in triplicate, the molar ratios are found to be reproducible to within 2–3 per cent. Tyrosine, however, is subject to rather wider variation, for reasons which are not at present understood.

For many purposes, a knowledge of the molar ratios is all that is required. However, when it is necessary to estimate the absolute amounts of the amino-acids present in a mixture, two independent methods of calculation are available. The less accurate one (2–5 per cent) involves a direct conversion of the optical density readings to micromoles by means of a set of effective millimolar extinction coefficients; they have the values 15·6/*F*, where *F* represents the above set of factors. The greater inaccuracy of this procedure arises from differences in the absolute recovery of colour from replicate chromatograms; however, these differences are not reflected in the molar ratios, since the variation seems to affect each amino-acid to a comparable extent. The preferable method, therefore, combines the more accurate (2–3 per cent) molar ratios with the total quantity of amino-acids present in the mixture; the latter figure, in turn, can readily be deduced from the alkali uptake which accompanies the reaction of the amino-acid mixture with 1-fluoro-2 : 4-dinitrobenzene. Thus, under the reaction conditions mentioned above, the alkali uptake is found to be 77 ± 1 per cent of the theoretical maximum (that is, 2 equiv. per NH_2 group, 1 equiv. for tyrosine OH and 0·25 equiv. for the iminazole ring of histidine), after due correction is made for the formation of dinitrophenol (0·044 μM of OH^-, $ml.^{-1}$ $min.^{-1}$). Incidentally, the latter by-product does not interfere with the chromatography when the condensation with fluoro-dinitrobenzene is carried out as described above in a solution approximately 0·01 *M* with respect to amino-acids; for more dilute solutions, however, it is necessary to reduce the dinitrophenol concentration by sublimation[4] before application to the paper.

The most obvious application of this method is to the analysis of protein hydrolysates, which requires about 0·2 mgm. of protein (equivalent to approximately 0·1 μM of each amino-acid) per chromatogram; although if paucity of material is not a decisive consideration, it is more convenient to weigh out 2–3 mgm. of protein, and take aliquots for chromatography as described above. The results of an analysis[5] made in this manner (in duplicate) of beef A insulin (kindly made available to us by Dr. Lyman C. Craig) are presented in Table 1, together with the results of an analysis[6] of the same material recently carried out by Dr. E. J. Harfenist using the classical ion-exchange column procedure of Moore and Stein[7], and, for comparison, the theoretical molar ratios for the structure proposed by Sanger[8]. Satisfactory analyses of α-corticotropin[9] (39 amino-acids), ribonuclease (123 amino-acids), growth hormone (361 amino-acids) and a variety of synthetic mixtures have also been made in this laboratory and will be reported separately.

Table 1. ANALYSES OF BEEF A INSULIN

24-hr. hydrolysates. Uncorrected for destruction or incomplete liberation from peptide linkages

	Residues per molecule		
	Levy and Chung (ref. 5)	Harfenist (ref. 6)	Sanger (theoret.) (ref. 8)
Asp	2·9	2·9	3
Glu	6·7	6·7	7
CySS	2·8	2·9	3
Ser	2·3	2·6	3
Thr	1·0	0·9	1
Gly	4·2	4·0	4
Ala	3·0	3·0	3
Pro	1·0	1·1	1
Val	4·6	4·7	5
Leus	7·1	6·5	7
Phe	3·0	3·0	3
Tyr	3·8	4·0	4
Lys	1·0	1·0	1
His	1·9	2·0	2
Arg	1·0	1·0	1
Totals	46·2	46·3	48

The method is, of course, ideally suited to the analysis of terminal amino-acids and peptides derived from proteins by Sanger's procedure[1], since they are already in the form of their dinitrophenyl derivatives. Further, by subjecting the hydrolysate to dinitrophenylation, an amino-acid analysis and end-group determination can be made on the same micro-sample of protein: examples of this application will be published elsewhere. Dr. J. I. Harris, in this laboratory, has successfully applied the method to the determination of very small quantities (0·05–0·2 μM) of amino-acids released by the action of carboxypeptidase on proteins. The method would also appear to be well adapted to the analysis of biological fluids, since it is unaffected by the presence of ammonia, salts or proteins.

The procedure described above has obvious affinities with the column-dinitrophenyl method of Mills[4], and with the many methods of quantitative paper chromatography of amino-acids using ninhydrin, copper, etc., as indicating reagents. Its particular feature is that it combines the convenience of the latter techniques with the accuracy of the former.

Full details of this method will be published shortly.

I wish to express my thanks to Mr. David Chung for his expert technical assistance, and to Prof. C. H. Li for his interest and encouragement in connexion with this work. The investigation was supported in part by research grants from the National Institutes of Health, United States Public Health Service (grant No. G 2907) and the Rockefeller Foundation. [Feb. 24.

Ribonucleotide Analysis of Individual Nerve Cells

CHEMICAL analyses of individual body cells are valuable in view of the importance of exact localization of substances; but reliable analyses can, however, be performed only to a limited extent. This is due to the difficulties of applying biochemical procedures in dimensions of the order of magnitude in question. It has therefore been necessary to rely almost entirely on histophotometric methods. In most cases there are only restricted possibilities of obtaining chemical data on the cell by such means. An account is given in the following of a procedure for the extraction, isolation and hydrolysis of the ribonucleic acid in individual nerve cells, with subsequent separation and identification of the mononucleotides formed.

The chromophil substance in the nerve cells has earlier been shown to contain a substance with many properties similar to those of ribonucleic acid[1]. It was, however, not known whether it also contains the four mononucleotides which characterize this acid. Analyses of the ribonucleic acid in nerve cells cannot be carried out with current macro- and microchemical methods. This is because of the structure of the nervous tissue, in which the cell bodies constitute only a small percentage of the volume. Consequently, it is necessary to analyse individual cells. Large cells with a volume of (10–100) × 10^3 μ^3 contain 100–1,000 pgm. of ribonucleic acid (1 pgm. = 10^{-12} gm.)[2]. Since the usual microchemical methods[3,4] require quantities a million times greater for analyses, we were obliged to use a special technique. By means of ionophoresis on a cellulose fibre, nucleotide analyses on individual motor anterior horn cells from the rabbit were performed.

Using a de Fonbrune micromanipulator[5], individual cells are dissected out of Carnoy-fixed nervous tissue, cut into sections 70 µ thick and mounted on cover-glasses. A section is saturated with dilute acetic acid and surrounded by liquid paraffin in an oil chamber[5]. A micro-needle is used for dissection, separate cells being placed on a free part of the cover-glass and crushed against it with the needle. Each cell is incubated with a volume of extraction fluid four to five times greater than that of the cell. The cells are extracted three times for a total period of 1 hr. at 20° C. The extraction medium consists of 0·4 mgm./ml. of ribonuclease in a 0·2-*M* ammonium carbonate, ammonium acetate buffer of *p*H 7·7. The buffering substances are volatile. The procedure so far is essentially the same as that used for quantitative determinations of ribonucleic acid from single cells[6].

The extracts are evaporated on another cover-glass, which forms the roof of a part of the oil chamber free from paraffin. The cell extracts are conveyed to this cover-glass with a micropipette. The extracted, enzymatically degraded nucleic acid is freed from buffer electrolytes by this evaporation. When each cell has been completely extracted and the extracts from one and the same cell have been evaporated on to the same point of the cover-glass, each cell extract is incubated with a volume of 1 *M* hydrochloric acid of the same order of magnitude as the extraction volumes. Evaporation is prevented with liquid paraffin. Hydrolysis is allowed to proceed for 18 hr. at 26° C. The hydrolysate is then evaporated on to a dry cover-glass, in the same way as in the extraction procedure. The hydrochloric acid is removed by this means from the mononucleotides formed during hydrolysis. When the extract is to be analysed, it is dissolved in a small volume of 0·02 *M* sodium hydroxide in the paraffin-filled chamber.

The mononucleotides formed are separated by ionophoresis on a cellulose fibre, using in principle the same technique as that described by Edström[7]. Artificial silk produced by the copper–ammonia method from cellulose is treated with alkali and saturated with a highly viscous, non-volatile citrate buffer of *p*H 3·6. A fibre is taken out of a thread and freed from excess moisture. It is then stretched on a quartz slide. Two dabs of a paste consisting of the citrate buffer stirred into silica gel are smeared on to the fibre at a distance of about 1 mm. from each other. The inverted quartz slide is then made to form the roof of a part of the oil chamber, free from liquid paraffin. A cover-glass with a dissolved hydrolysate forms an oil-filled part in the same chamber. Hydrolysate is taken from the cover-glass with a micropipette and, with the tip of the pipette applied to the fibre, it is evaporated at some point between the two dabs of paste. This part of the chamber is then also filled with liquid paraffin.

Metal wire electrodes are insdrted into the dabs of paste by means of the micromanipulator. When the buffer has a viscosity of 500 poises, a direct current voltage of 500 V./mm. is applied for 90 min. The mononucleotides move towards the anode and separate from each other to a total distance of about 0·5 mm. When adequate separation has been achieved, the quartz slide is removed from the chamber and taken to the Köhler ultra-violet microscope. The fibre is photographed in monochromatic light of 257 and 275 mµ. The migration velocities and the ratio of the absorption values for each band at 257 and 275 mµ have been found to be equal to those of the bands resulting from ionophoretic runs of pure preparations of the four ribomononucleotides. The bands, counting from the cathode to the anode, are: cytidylic acid, adenylic acid, two bands of guanylic acid and uridylic acid. Cytidylic acid and guanylic acid are found in the largest amounts. An ionophoretic analysis of a motor anterior horn cell from the rabbit is shown in Fig. 1.

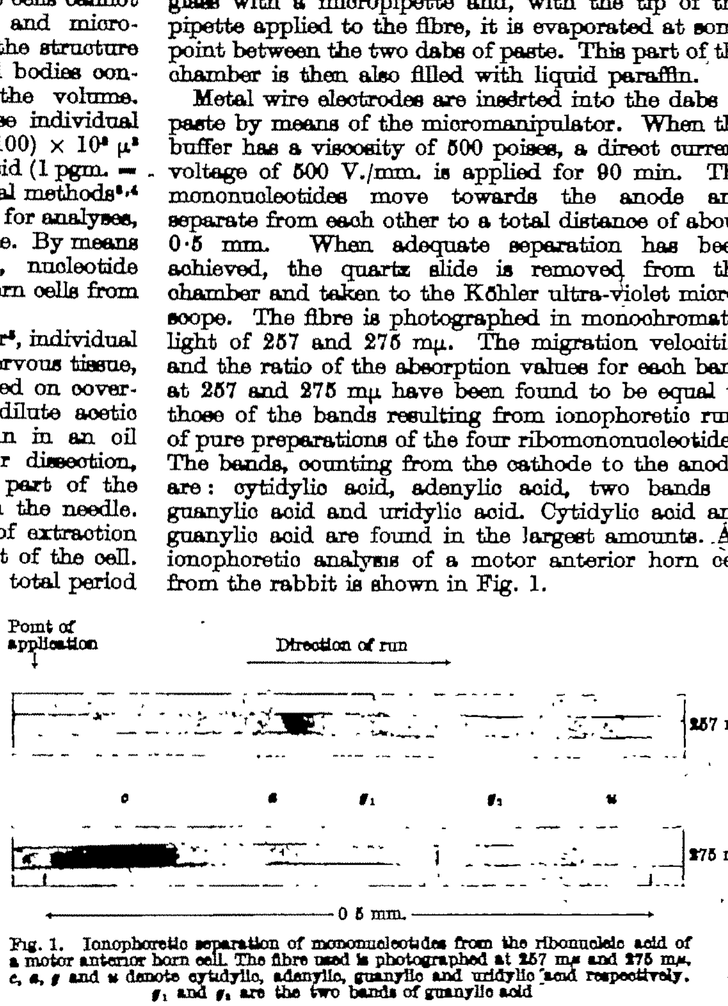

Fig. 1. Ionophoretic separation of mononucleotides from the ribonucleic acid of a motor anterior horn cell. The fibre used is photographed at 257 mµ and 275 mµ. *c*, *a*, *g* and *u* denote cytidylic, adenylic, guanylic and uridylic acid respectively. g_1 and g_2 are the two bands of guanylic acid

It is evident that the nerve cells contain a ribonucleic acid which, with respect to nucleotide composition, is similar to that obtained from other organs of the body.

A Possible Function of Intracellular Ribonucleases

MANY theories have been put forward concerning the mechanism of protein synthesis, and most of them have suggested that ribonucleic acid acts as a template upon, or alongside which, peptide chains are synthesized. The arrangement of the amino-acids in the peptide chain is supposedly regulated by the highly specific arrangement of the nucleotides which, it has been suggested[1,2], may contain high-energy phosphate at the proper intervals to effect peptide bond synthesis. A recent detailed account of this theory and some evidence for the phosphorylation of ribonucleic acid has been offered by Dounce[1,3].

It is not clear how the peptide chains, once formed, would be separated from the nucleic acid, since there would be strong electrovalent forces holding them together, particularly between highly positive basic amino-acids and strongly negative nucleotide residues, as well as secondary hydrogen bonding and van der Waals's forces. It is possible that the release of the protein may be accomplished by partial or complete degradation of the polynucleotide chain by intracellular ribonucleases. It should not be difficult to devise experimental procedures to determine whether these enzymes are able to break down the ribonucleic acid portion of ribonucleoprotein complexes, thereby releasing active enzymes. If a system could be obtained in which complexes of enzymes with ribonucleic acid tended to accumulate, then the addition of a ribonuclease to such a system should result in an increase in enzyme activity.

Attempts were made to demonstrate this using relatively old (7–10 days) cultures of *Tetrahymena pyriformis* S. The methods of preparation of the cultures, isolation of the organisms and preparation of the homogenates, as well as the enzyme assays have been previously described[4,5]. Assays were carried out for deoxyribonuclease and the oxidation of succinate. The results of a typical experiment with deoxyribonuclease are shown in Fig. 1. The addition of 2·5 mgm. of protease-free ribonuclease (Worthington Biochemical Sales Co.) approximately doubled the deoxyribonuclease activity, so that the hydrolysis of the substrate was essentially complete after 30 min., whereas in the control this required [illegible]0 min. Similar results were obtained with 8–10 day old cultures of the *W* strain.

In the assays for the oxidation of succinate the results were more variable. Increase in activity on addition of ribonuclease (0·1–0·5 mgm. per Warburg flask) ranged from 0 to 35 per cent. The succinate oxidizing system does not appear to be well suited to these experiments, as in older cultures the activity was quite low and small changes were thus likely to be magnified.

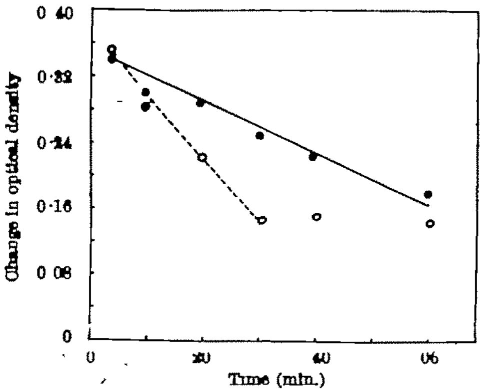

Fig 1. The deoxyribonuclease activity of a homogenate of an eight-day old culture of ***Tetrahymena pyriformis*** S. with and without added crystalline pancreatic ribonuclease. Closed circles, control, open circles, control plus 2·5 mgm. ribonuclease. The system contained 10·0 ml. of 0·1 *M* veronal-acetate buffer, *p*H 5·2, 10·0 ml. of 0·2 per cent NaDNA and 5·0 ml. of homogenate. The activity is expressed in terms of the decrease in optical density with time of aliquots precipitated with an equal volume of 1·0 *N* HCl. The values above have been corrected for the action of crystalline pancreatic ribonuclease on the RNA in the homogenate. The sample of pancreatic ribonuclease used had no action on NaDNA under identical conditions

The above results are admittedly only suggestive, but it may be possible to obtain a better demonstration of the release of protein enzymes by ribonuclease in some other biological system, possibly one that has been inhibited by ribonuclease inhibitors. Recently, Lundblad and Hultin[6] demonstrated the liberation of proteolytic enzymes of the sea urchin egg by ribonuclease. A clearer proof would be to show an increase in enzyme activity or the liberation of enzyme activity on treatment of purified isolated ribonucleoprotein with ribonuclease.

The rather rapid turnover of ribonucleic acid in both the cytoplasm and nucleus might be due to the action of intracellular ribonucleases, and the occurrence of these enzymes in the nucleus, as well as the cytoplasm, in certain tissues seems probable[7].

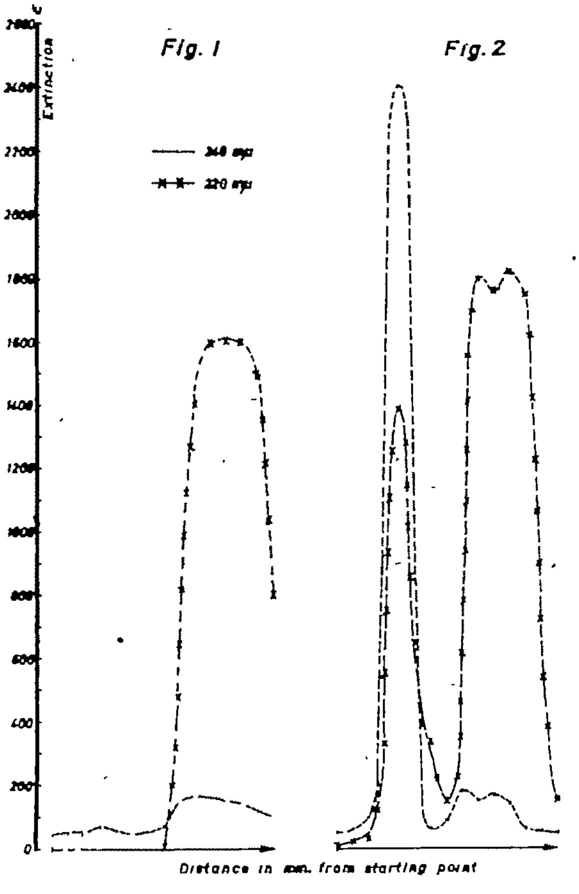
Solubility and Electrophoretic Behaviour of Steroid-Detergent Mixtures in Aqueous Buffers

WE have tried to overcome the well-known difficulty of preparing aqueous solutions of steroids by the use of detergents. We have been interested further in the study of the behaviour of the detergents themselves and of steroid-detergent mixtures in the electric field and in the practicability of separating steroids by this means. One of us[1] has described the application of paper electrophoresis for separating steroids after esterifying with anhydrous succinic acid and forming the sodium salt. There are very full accounts of protein-detergent complexes and their behaviour in the electric field[2,3]. Polonovski[4] has recorded his studies of the dissolving power of invert soaps in cholesterol, lecithin, cerebrosides and glycerides; but we were unable to find any similar observations on steroids and detergents.

A special procedure permits the emulsification or dissolution of crystalline steroids (deoxycorticosterone, androsterone, cortisone, testosterone (Schering A.G., Berlin)) and of the neutral ketonic fraction of urine in aqueous buffers by anionic, cationic or non-ionic detergents. There are seemingly analogous stoichiometric relations as in protein detergent complexes. In general, the ratio deoxycorticosterone: detergent was 1 : 4; but it was necessary to double the concentration for androsterone. The dissolving power increases from cationic through anionic to non-ionic detergent; but anionic detergents were most effective in our electrophoretic tests.

Paper electrophoresis was performed according to the method of v. Holt, Voigt and Gaede[5], using phosphate buffers of pH 7·2 and an ionic strength of 0·045. The paper strips after electrophoresis were examined by fluorescence and the required parts cut out and eluted; alternatively, lengths of 5 mm. were cut off and eluted.

Electrophoresis of detergents alone had various results according to the brand and purity of detergent. Up to seven distinct isolated bands could be determined by fluorescence and ultra-violet absorption.



Detergent W 6763 (Chemische Fabrik Stockhausen und Cie., Krefeld), the sodium salt of a sulphonated alkyl-benzene, was the most useful for the paper electrophoresis of steroids, its dissolving power being effective and having only one strong and a second weak band.

Fig. 1 shows the electrophoretic behaviour of W 6763; Fig. 2 shows that of the W 6763 cortisone complex. The abscissæ give the distances from starting point in mm. intervals, the ordinate the extinction at 240 and 220 mμ. The migration of the detergent-cortisone complex is evident. We were able to show the migration of deoxycorticosterone and androsterone in the same manner.

Investigations by this method are being carried out, especially in separating steroids of urine. Details of this work and the possible biological use of such steroid-detergent solutions will be described elsewhere.

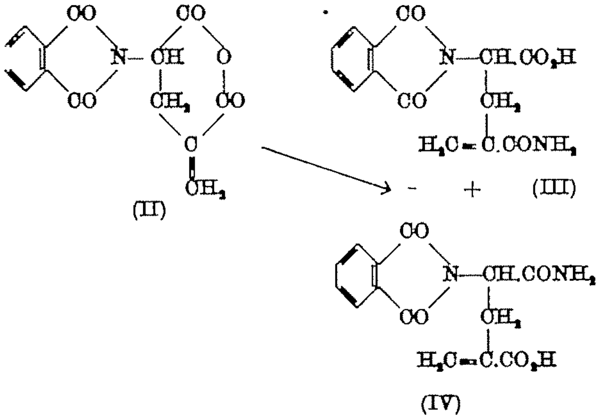
Synthesis of γ-Methyleneglutamic Acid and γ-Methyleneglutamine

The isolation of two unsaturated amino-acids (I, X = OH and NH$_2$) was recently reported[1]. They were first obtained from groundnut plants, but have since been detected in two quite unrelated species, namely, tulips[2] and hops[3]. In groundnut plants they have been shown[4] to be of considerable biochemical importance, playing a major part in nitrogen transport.

$$HO_2C.CH(NH_2).CH_2.C(=CH_2).CO.X \qquad (I)$$

We have now confirmed these structures by rational synthesis. 1-Formamidobut-3-yne-1 : 1-dicarboxylic ester[5] was treated with nickel carbonyl in aqueous-ethanolic acetic acid[6], when the expected Reppe carboxylation took place, giving the corresponding α-substituted acrylic acid in 45 per cent yield. Vigorous alkaline hydrolysis then removed ester groups and effected decarboxylation and extensive deformylation, giving (I, X = OH) directly, admixed with the corresponding formyl derivative, which was readily separated.

Treatment of (I, X = OH) with phthalic anhydride in pyridine and afterwards with acetic anhydride yielded (II), which was treated with ammonia under anhydrous conditions. In contrast to the corresponding derivative of glutamic acid itself[7,8], this anhydride gave a mixture of half-amides (III and IV) inseparable by crystallization, but counter-current partition between n-butanol and M-phosphate buffer (pH 6·2) separated the two isomers, which had almost identical melting-points (205°) but significantly different dissociation constants (pK values 5·18 and 5·99 in 60 per cent ethanol; cf. values of 4·93 and 6·38 for phthalimidoacetic and methacrylic acids, respectively, under these conditions). The more abundant and more acidic isomer, evidently (III), gave a complex



mixture of products on treatment with hydrazine in boiling alcohol[7b], but in cold, neutral aqueous solution[7a] gave a 25 per cent yield of an easily isolated amino-acid (I, $X = NH_2$). From (IV) no homogeneous dephthaloylation product could be obtained.

The identity of (I, $X = OH$) and natural γ-methyleneglutamic acid was established by racemizing the latter in acid solution and examining infra-red spectra of 'Nujol' suspensions[8a] and X-ray powder diffraction lines[8b]. In each case detailed and identical patterns were obtained. The two racemic acids were shown to be inseparable from the natural L-acid (configuration assumed) when co-chromatographed on Whatman No. 4 filter-paper, using water-saturated phenol, n-butanol–acetic acid[9], collidine–lutidine[10], or 70 per cent n-propanol as solvents. Identical and characteristic yellowish-brown spots were obtained when the dried chromatograms were treated with ninhydrin; in aqueous solution with an excess of the reagent normal blue-purple colours resulted. Finally, the synthetic and racemized natural acids were decarboxylated by *Clostridium welchii S.R.*12 (N.C.T.C. 6784), when under comparable conditions in a typical experiment the initial rates of carbon dioxide evolution were 149 and 154 $mm.^3$/hr., respectively. The natural L-form was decarboxylated at about double the rate of the DL-forms; in all cases complete decarboxylation of the L-isomer eventually occurred, with the liberation of the theoretical amount of carbon dioxide.

The identity of synthetic (I, $X = NH_2$) and the natural L-amide—which has not as yet been racemized without simultaneous hydrolysis—could not be confirmed by infra-red[8a] or X-ray diffraction data[8b]. These showed appreciable differences, due, no doubt, to the former being a true racemate; infra-red spectra of optically active amino-acids and the corresponding racemates are known[11] to show unusually large differences, probably because of the importance of hydrogen bonding in their crystal lattices. The two amides were, however, inseparable on paper chromatograms developed with the solvents listed above, and gave identical reddish-brown spots when the dried chromatograms were treated with ninhydrin. Both amides were enzymically deamidated to γ-methyleneglutamic acid by dialysed extracts of groundnut leaves at pH 7; using solutions equimolar with respect to the L-isomer the deamidation appeared to proceed at similar rates for the two substances. The natural acid was completely converted to γ-methyleneglutamic acid in less than 3 hr., while approximately 50 per cent of the synthetic amide (that is, the D-isomer) remained at the end of the same period. Since the other known deamidases are fairly specific as to substrates, these observations indicate, independently of other evidence, that the two amides are identical in structure.

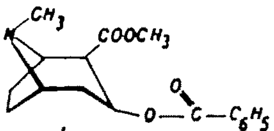
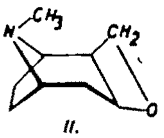
Stereochemistry of Cocaine

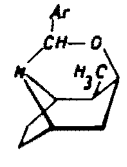
Two years ago, positive evidence was presented for the configurations of tropin and ψ-tropin[1], ψ-ecgonin[2], scopolamine and valeroidine[3] using the acyl migration reaction[4,5] and other methods. Regarding the steric structure of cocaine (I), the *cis* relationship of the COOH and OH groups has been demonstrated[2], while in ψ-cocaine these groups appear to be *trans* placed. The failure of N-acetyl-*nor*-ecgonin ethyl ester to undergo acyl migration was considered[3] as evidence for the *anti* position of both functional groups of (I) with respect to the ring nitrogen atom. However, we tried to get more conclusive experimental proofs; more so since our attention was directed by G. Stork (private communication, October 15, 1952) to the possibility of dehydration during acyl migration in the case of N-acetyl-*nor*-ecgonine ester. Furthermore, Prof. W. Hückel postulated (January 24, 1953) the hindering effect of the carbethoxyl group to be responsible for the failure of the acyl shift.



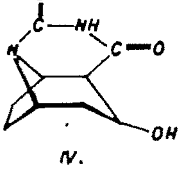
I.



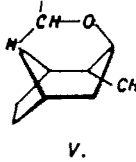
II.



III.



IV.



V.

Ecgoninol was converted into 2-chloromethyl-3-tropanol (hydrochloride m.p. 217° $[\alpha]^{20}_{D} = -60\cdot2$ (H_2O)), and this, in turn, forms by hydrogenolysis 2-methyl-3-tropanol (m.p. 56°, $[\alpha]^{20}_{D} = -58\cdot2$ (C_2H_5OH)).

On the other hand, the chloromethyl derivative furnished a compound on the action of sodium bicarbonate—a compound showing correct analytical data for the structure of an internal ether (II) (hydrochloride, m.p. 222°; $[\alpha]^{20}_{D} = -78\cdot3°$ (H_2O). Found: C, 57·08; H, 8·28; N, 7·28; Cl (ionic), 18·63. $C_9H_{15}ON.HCl$ requires: C, 56·97; H, 8·50; N, 7·39; Cl (ionic), 18·70 per cent). This did not show olefinic character, but can be reconverted by hydrochloric acid under pressure into the chloromethyl derivative and gave on the action of sodium methoxide 2-methoxymethyl-3-tropanol.

The formation of (II) from ecgoninol gives definitive evidence for the *cis* position of the CH_2OH and OH groups (already proved by the formation of a cyclic benzylidene acetal with a six-membered ring[3]) and consequently for that of the functional groups in cocaine, since a four-membered ring fused to a six-membered ring in the 1.2-position is too highly strained to exist in a *trans* modification[6].

2-Methyl-3-tropanol (from I, m.p. 56°) was converted into the *nor* compound ($[\alpha]^{20}_{D} = -57°$, H_2O) and this, in turn, furnished reversibly an oxazine derivative (III) ($[\alpha]^{20}_{D} = +3\cdot5°$), when treated with *p*-nitrobenzaldehyde. (The conversion of *nor-syn*-tropine into an oxazine was realized first by Hardegger *et al.*[8]. This method furnished obviously in the case of its homologues non-equimolecular mixtures of the two possible epimers on the μ-C-atom. Consequently, the analytical figures correspond to the calculated values, but the melting points are not sharp.) Thus the correlation of cocaine to ψ-tropine is established. Meanwhile, in agreement with our findings, Findlay recorded recently[7] another piece of evidence for the *syn* position of C_3—OH and ring N in (I) and consequently for the C_2-epimerism of cocaine and ψ-cocaine. This was based upon the method of acyl migration O → N, in the case of O-benzoyl-*nor*-ecgonin.

Direct evidence supporting the *syn* position of COOH and N in cocaine is now presented by us as follows.

N-cyano-*nor*-cocaine gave on hydration N-carbamyl-*nor*-cocaine (m.p. 180°; $[\alpha]^{20}_{D} = -34°$, CH_3OH), and this, in turn, furnished on the action of sodium methoxide at − 15° (to avoid epimerization at C_2) N-carbamyl-*nor*-ecgonin methyl ester (m.p. 212°; $[\alpha]^{20}_{D} = -93°$; in 70 per cent CH_3OH (H_2O)), together with the neutral cyclic ureid of N-carbamyl-*nor*-ecgonin (IV) (m.p. 198°. Found: C, 55·45; H, 6·30; N, 14·09; OCH_3 φ; active H, 1·03 per cent. Calc. for $C_9H_{12}O_3N_2$: C, 55·00; H, 6·16; N, 14·29; OCH_3 φ; active H, 1·01 per cent).

Furthermore, considering the formation of (II) and (III), the structure of (−) 2β-carbomethoxy-3β-benzoyloxy-tropane (for the stereochemical notation of tropane derivatives the α,β conventions proposed in our first paper[1b] were used) (I) for cocaine is confirmed.

These facts may also be regarded as additional evidence for the steric structure of ψ-cocaine, suggested previously by one of us[4]. A further direct proof for the *syn* position of C_3—OH and N was furnished by converting it via ψ-ecgoninol into 2-methyl-*nor*-3-tropanol ($[\alpha]^{20}_{D} = +50\cdot5°$), which afforded a cyclic oxazine derivative (V) ($[\alpha]^{20}_{D} = +70\cdot5°$) when condensed with *p*-nitrobenzaldehyde.

Since the stereochemistry of cocaine and ψ-cocaine seems to be settled, further investigations will be directed towards the synthesis and configuration of the two remaining epimers.

Experimental details will be published soon in *Helvetica Chimica Acta*[9].

Transition Temperatures of Polymers at Ultrasonic Frequencies

THE variation of ultrasonic velocities with temperature in methyl methacrylate polymers was determined by Protzman[1] and by Melchor and Petrauskas[2]. Using the optical diffraction method, Protzman found a transition temperature at which there is an abrupt increase in slope in the linear variation of the velocity with temperature and also found that this transition temperature decreases linearly with frequency, in the range covered by his experiments. Working in the same range of frequencies and using the pulse method, Melchor and Petrauskas reported a slightly different transition temperature which, however, was found not to vary with frequency.

Using the ultrasonic pulse method involving the principle of total internal reflexion described in detail

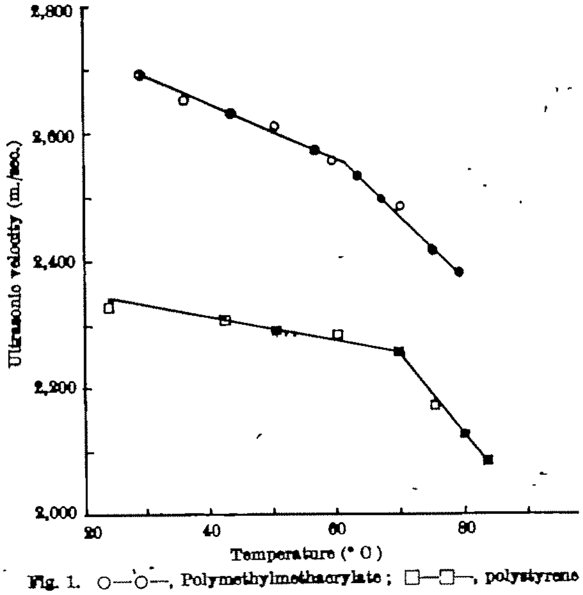

Fig. 1. ○—○—, Polymethylmethacrylate; □—□—, polystyrene

in a paper by Krishnamurthi and Balakrishna[3], we have determined the variation of longitudinal velocities with temperature in methyl methacrylate and styrene polymers. We have found that there is a transition temperature for sound velocity in polystyrene. The velocities are measured with an error of less than 1 per cent.

The velocities are determined at four different frequencies in each case, namely, 1·15, 2·30, 3·45 and 5·75 Mc./s. For the first two frequencies, the thickness of the samples used is not sufficient to give correct values of velocity, whereas for the two higher frequencies identical values of velocities are obtained at each temperature. However, at all frequencies, the transition temperature is found to be the same. In Fig. 1 the results obtained at the higher frequencies are plotted. The graphs show transition temperatures at 61° C. for polymethyl methacrylate and at 70° C. for polystyrene. Thus, in the frequency-range 1–6 Mc./s. used in this experiment, the transition temperature remains the same at all frequencies. This is in agreement with the earlier observation by Melchor and Petrauskas in polymethyl methacrylate.

We thank Prof. S. Bhagavantam for his guidance and interest throughout this work.

Chlorine Isotope Effect

DURING the past few years, there has been a growing interest in the differences in reaction-rates which arise from isotopic substitution. Attention has been largely focused on the isotopes of carbon, nitrogen and oxygen[1], but recently the effect has been demonstrated for heavier atoms, in particular for the isotopes of sulphur[2].

We have been able to demonstrate such an isotope effect for the natural isotopes chlorine-35 and chlorine-37. We allowed *tert.*-butyl chloride to react with silver nitrate in 98 per cent alcohol at room temperature and found that the chlorine-35 compound reacted faster than the chlorine-37 compound. Three experiments were carried out as follows.

(1) The silver chloride formed by reaction of the first 30 per cent of the *tert.*-butyl chloride was isolated, the silver chloride formed from the remaining 70 per cent being rejected. (2) The silver chloride formed by total reaction of the *tert.*-butyl chloride was isolated. (3) The silver chloride formed by the reaction of the first 95 per cent of the *tert.*-butyl chloride was rejected and that from the last 5 per cent was isolated. Each of the three silver chloride samples was converted to chlorine gas by a procedure designed to avoid isotopic fractionation, and the isotopic composition of the samples was determined by mass spectrometry. The ratios of chlorine-35 to chlorine-37 found were: (1) 3·104 ± 0·003, (2) 3·087 ± 0·003 and (3) 3·019 ± 0·005. (The natural abundance ratio as measured by Nier[3] is 3·07 ± 0·03.) The relative rates of reaction for the two isotopically distinguishable *tert.*-butyl chlorides, $^{35}k/^{37}k$, were calculated first from the results of experiments (1) and (2) and secondly from the results of experiments (2) and (3). The values thus obtained were 1·007 ± 0·003 and 1·008 ± 0·001.

We hope to present a more detailed account of this work at a later date.

Paper Electrophoresis of *Strychnos* Alkaloids

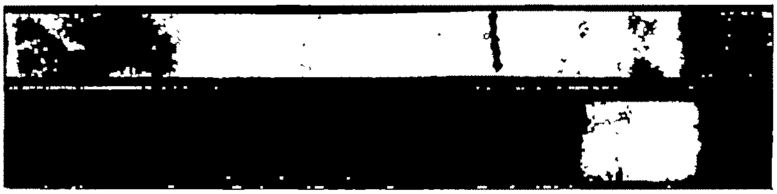
IN several recent publications, separation of the alkaloids of the South American *Strychnos* into a great number of constituents by paper chromatography has been recorded[1,2]. The most successful solvents for two-dimensional analysis yield, however, almost the same sequence of spots. Thus it was considered desirable to find methods of separation which gave sequences different from those obtained by partition chromatography.

Several authors have already used paper electrophoresis for the separation of organic bases, the acridine compounds[3] as well as some pairs of alkaloids[4,5]. Also some alkyl ammonium quaternaries, the functional group of which is common to all the *Strychnos* alkaloids, have been recently separated by one of us by paper electrophoresis[6].

Separation of the alkaloid chlorides of *Strychnos trinervis* prepared from soluble reineckates were effected: (i) with *M*/5 borax as electrolyte using Whatman No. 31 (extra thick) paper and a potential of 300 V. for one hour; for this separation the paper was sandwiched between two glass plates as previously described by one of us[7]; (ii) with 25 per cent acetic acid as electrolyte, also on Whatman No. 31 extra thick paper with 300 V. for one hour, but employing the technique of Durrum[8].

Both electrolytes produce fractionation into several bands. The fluorescent bands visible under ultraviolet light are shown in Figs. 1 and 2. Other bands may be revealed by using specific reagents for *Strychnos* alkaloids such as ceric sulphate solution[9], cinnamic aldehyde and hydrochloric acid[10], ferric chloride, etc.

The sequence of the bands is different in the two cases. Comparing the bands of the two electropherograms on the basis of the colorations with reagents and under ultra-violet light, it is possible to establish the presence and the position of some alkaloids such as C-calebassin, C-fluorocurin and C-alkaloid *K*, already detected in the same product by paper chromatography.



Since as many as eight to twelve bands can be detected by the various methods on a single electropherogram, a complete resolution of all the constituents may be feasible by carrying out a continuous electrophoresis with one of the two electrolytes followed by electrophoresis and/or paper chromatography of the fractions obtained.

A New Spray Reagent for Paper Chromatography of Polyols and Cetoses

VARIOUS reagents for indicating polyols in paper chromatography have been proposed by Hough, Buchanan *et al.* and Hockenhull[1]. These reagents all have the disadvantage of reacting also with the sugars, not distinguishing them from the polyols.

We have found a reagent which enables us to distinguish the polyols from the cetoses but does not reveal the aldoses. Just before use, one volume of 1 per cent vanillin solution in ethanol is mixed with one volume of 3 per cent perchloric acid in water. This is sprayed on the previously dried chromatogram, which is put in an oven at 85° C. for 3–4 min. Glycerol, erythritol, xylitol, arabitol, adonitol, mannitol and sorbitol give, on a pale sandy background, spots going from pale blue to lilac pink, then all swiftly turning to pale grey-blue. Inositol, dihydroxyacetone, the aldopentoses and the aldohexoses do not react, except rhamnose, which gives a brick red spot. Sorbose and fructose give a very deep grey-green spot, easily distinguished from that of the polyols.

The limiting amounts of these substances which can be identified are: 0·005 mgm. for the cetohexoses, 0·015 mgm. for the hexitols, 0·020 mgm. for rhamnose and the pentitols, 0·025 mgm. for erythritol and 0·03 mgm. for glycerol.

The phenols and some indolic compounds react also with this reagent, which explains why it cannot be employed when using phenol or cresol as chromatography solvent. Similarly, it cannot be used for some acids, especially malonic and gluconic acids, which give the same tint as the polyols. Acid and basic substances must be removed by suitable ionic resins before polyols can be identified by this reagent.

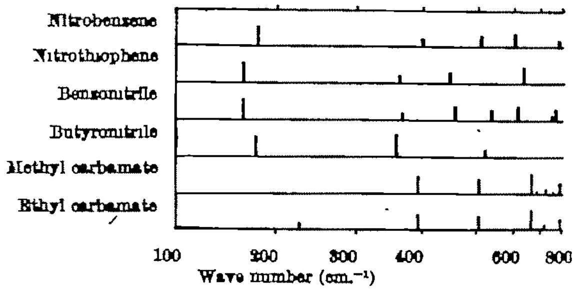
Odour and Molecular Vibrations

DYSON'S[1] hypothesis correlating odour specificity with molecular vibration has recently been extended by Wright[2] to frequencies below about 700 cm.$^{-1}$. In this region he claims to have found a statistically significant correlation for sixteen compounds with an almond-like odour, all but one (nitrothiophene) being benzene derivatives.



Our recent infra-red studies have included the aliphatic urethanes, the first member of which methyl carbamate, possesses a distinct almond odour Its Raman[3] and infra-red frequencies are shown above together with those of ethyl carbamate and the four spectra depicted by Wright. The spectrum of methyl carbamate bears a closer similarity to the spectra of the 'almond-like group' than the spectrum of butyronitrile does, in spite of the fact that the seemingly characteristic frequency at 170 cm.$^{-1}$ is absent. Due to the lack of a suitable prism, we were unable to extend our investigations to this region it also appears that the Raman studies were not extended as low as this, so that it is quite possible that methyl carbamate possesses this vibration and a search for such a frequency would be worth while

On the other hand, the spectrum of ethyl carbamate also shows a similar resemblance to the 'almond-like group' yet has no trace of such an odour, being in fact almost odourless.

These observations emphasize the necessity for a much more detailed survey, covering several groups of compounds of different odour, as suggested by Dyson[4]. Due to the sparse data in the region below 700 cm.$^{-1}$ it would seem that some long time must elapse before such a comprehensive survey can be attempted and a reasonable foundation for a molecular vibration theory of odour obtained.

This work was carried out at the Edward Davies Chemical Laboratories, University College, Aberystwyth, by kind permission of Prof. C. W. Davies.

Indirect Effect of Ultra-Violet Light on Skin Blood Vessels

IT is known that the ultra-violet wave-lengths responsible for producing vasodilatation or erythema penetrate only a short way into human skin[1,2]. These studies, however, do not by themselves exclude a direct action of ultra-violet light on the blood vessels as the cause of the characteristic erythema, for they have shown that a small fraction (up to 20 per cent) of these wave-lengths is able to penetrate through the avascular epidermis to the vascular corium. Further evidence that the effect of ultra-violet light on the skin blood-vessels is an indirect one would therefore seem of interest.

The following experiment was carried out. In each of six normal female subjects aged nineteen to twenty-three, three skin sites were marked out close together on the lower part of the back. Histamine was introduced into two of these three areas by iontophoresis; the anode (7·25 sq. cm.) of a d.c. circuit was applied to four layers of filter-paper soaked in a 10^{-4} gm./ml. solution of histamine, the cathode being a large pad of lint soaked in water and applied to the thigh. A current of 0·5 m.amp. was passed for 10 min. At the end of this time the skin was whealed and flared. Into one of the wheals a 2·5 per cent solution of tripelennamine hydrochloride ('Pyribenzamine', Ciba) was injected. All three sites were then exposed to ultra-violet light from a Kromayer lamp at contact range for 30 sec. The sites were inspected 24 hr. later. It was found that in each subject all three areas—control, whealed, whealed and injected with tripelennamine—showed a similar and normal sunburn response.

It is known that wheal fluid has a protein content similar to that of serum[3]. It is also known that serum[4], serum albumen[5] and tripelennamine hydrochloride[6] all strongly absorb the ultra-violet wave-lengths responsible for producing erythema. In the present experiment histamine was introduced into the skin by iontophoresis in order to involve the superficial blood vessels in a wheal and so provide them with a surrounding screen of serum-like fluid. An attempt was made to reinforce this screen in one of the two whealed areas by injecting tripelennamine hydrochloride into the wheal fluid. In spite of these screens, the development and appearance of vasodilatation following irradiation with ultra-violet light was quite normal. These observations supply further evidence that the ultra-violet wave-lengths responsible for vasodilatation act primarily on the epidermis and not directly on the blood vessels.

Structures of Native and Mercerized Celluloses

In *Nature* of February 13, p. 298, Sen and Roy report new equatorial reflexions in the X-ray diagrams of native and mercerized celluloses; the corresponding mean spacings are 13·6 A. for native, and 14·4 A. for mercerized, cellulose. Similar extra reflexions have been reported from time to time, but they have always been found to be spurious, in the sense that they were not due to diffraction of the characteristic radiation that was employed. They may even appear when supposedly monochromatic radiation, obtained by reflexion from a crystal, is used, if precautions are not taken to eliminate radiation with a wave-length half that of the selected radiation[1,2]. However, a commoner cause of spurious reflexions is the diffraction of certain components of the 'white' radiation present in the X-ray beam when unfiltered or filtered radiation is used[3-6].

The most complete study of this phenomenon is that of Sisson, Clark and Parker[6], who showed that the effective components of the 'white' radiation have wave-lengths coinciding with those of the silver and bromine absorption edges. These workers had previously observed spots in the X-ray diagrams of native and mercerized celluloses that corresponded to apparent spacings of 13·4 A. and 14·2 A. respectively, and they were able to demonstrate that these spots were, in fact, silver absorption edges. Their observations and conclusions have been confirmed in these laboratories, and silver absorption edges that could be mistaken for $K\alpha$ reflexions have also been observed in X-ray photographs of nylon, 'Orlon' and silk.

Sen and Roy state that their X-ray photographs were taken "under various conditions of prevailing humidity, intensity and purity of radiation (including monochromatic radiation)"; they thus imply that the new reflexions were obtained even when monochromatic radiation was employed; but they give no details about the method used to obtain such radiation. There is nothing in their communication to suggest that they gave special consideration to the possibility that these reflexions might be spurious, and until this possibility has been fully tested it would be premature to conclude that the accepted structures of native and mercerized celluloses require revision.

[6] Sisson, W. A., Clark, G. L., and Parker, E. A., *J. Amer. Chem. Soc.*, 58, 1635 (1936).

The article by M. K. Sen and S. C. Roy in *Nature* of February 13, p. 298, invites the following comments:

(1) A reflexion at $2\theta \simeq 6°$ which, if it resulted from copper $K\alpha$ radiation, would correspond to a Bragg spacing of ~ 14 A. is sometimes observed in X-ray photographs of cellulose (I, II, III or IV) when nickel-filtered radiation is used; but it is never observed with strictly monochromatic radiation (assuming that the cellulose is free from foreign matter having a spacing of this value).

(2) The intensity of this reflexion relative to (002) copper $K\alpha$ does not apparently depend upon whether the specimen is wet or dry, but is very sensitive to the particular copper anode in use at the time (demountable X-ray tube), being normally zero.

(3) The position of this reflexion is slightly different for each of the cellulose structures I, II, III and IV, and in every case is such that it would result from the reflexion of radiation of wave-length $\simeq 0·47$ A.

from the strongest plane(s). The two strong planes (002), (101) of cellulose II are not resolved at $2\theta \simeq 6°$ in the X-ray cameras generally employed for fibre work (excepting low-angle cameras), so that in all cases the extra reflexion appears single.

(4) With the tube conditions which produce a reflexion from cellulose at $2\theta \simeq 6°$, a reflexion is obtained from other substances, for example, from graphite at $2\theta \simeq 8°$, again corresponding to a wavelength of $\sim 0{\cdot}47$ A.

It can only be concluded that the reflexion at $2\theta \simeq 6°$ provides no justification whatsoever for revision of the unit cells of any or all cellulose structures.

H. J. WELLARD

British Rayon Research Association,
Barton Dock Road,
Urmston,

March 2.

THE occurrence of an equatorial reflexion of spacing about 15 A. in the X-ray photograph of jute has been observed consistently in this Laboratory over a period of more than six years. The following observations indicate that this reflexion is not spurious in the sense claimed by Warwicker and Wellard.

(1) It appears on photographs taken with radiation monochromatized by reflexion in calcite, using a line slit.

(2) It appears in photographs taken with nickel-filtered copper radiation from an X-ray tube run at 22 kVp., which is below the excitation voltage of 0·47 A. radiation.

(3) In photographs taken with filtered radiation (30 kVp.) and with a sheet of aluminium 0·3 mm. thick interposed between two photographic films, it appears on the first film but not on the second, on which the white radiation alone is recorded (transmission at 0·5 A. about 86 per cent for 0·3 mm. aluminium).

(4) We have observed the reflexion using an experimental Geiger–Müller spectrometer (filtered radiation).

(5) We have observed consistently that the intensity of the reflexion in jute depends on the humidity in the way described by Sen and Roy. The changes of intensity are, by visual estimation, much greater than can be ascribed to the effect reported by Legrand, who found (002) to be rather stronger for wet than for dry specimens.

(6) In our experience (and here we differ from Sen and Roy), the reflexion does not occur in ramie photographs taken under the same conditions as the jute photographs referred to above, although the (002) reflexion in ramie is at least as intense as, and is certainly sharper than, that of jute. We have evidence, at present inconclusive, that degradation of ramie fibres may, in certain circumstances, lead to the appearance of this reflexion or one of similar spacing.

Conductivity Induced in Polytetrafluoroethylene by X-rays

IN the course of further measurements of conductivity induced in insulating materials by X-rays[1,2], we have investigated polytetrafluoroethylene, and find a relatively large induced current with a very long time constant. A small cylindrical condenser 2·5 cm. long with polytetrafluoroethylene as the dielectric medium was used in a vacuum chamber for the measurements during irradiation. The current (down to 10^{-12} amp.) was measured with a Baldwin 'Ionex' Mk3 d.c. amplifier. The X-rays were generated at 220 kVp., with a half-value layer of 1·7 mm. of copper.

Dose-rate dependence. The equilibrium induced current i is related to the dose-rate R by the general relationship:

$$i \propto R^{\Delta},$$

where Δ is a characteristic of the material. For polytetrafluoroethylene over the range $R = 2$ to 65 r./min., and between 20° and 110° C., we find $\Delta = 0{\cdot}63 \pm 0{\cdot}08$, with the higher values at the lower temperatures. This is in contrast to 'Perspex'[2] and some specimens of amber, for which $\Delta = 1{\cdot}0$, but compares with polythene[2,3], for which $\Delta = 0{\cdot}8$.

Such a value of Δ leads us to postulate an exponential distribution of traps below the conduction band for polytetrafluoroethylene, using Rose's model of electron trapping[4]. Quantitative predictions can also be made of the temperature-dependence of induced current.

Temperature dependence. Fig. 1 shows the curves of log conductivity of polytetrafluoroethylene plotted against $1/T$°K. The relationship is of the usual form[1]:

$$\sigma = \sigma_0 \exp(-W/kT),$$

giving a straight line the slope of which is a measure of W.

Curve *a* in Fig. 1 is for the 'static conductivity' (that is, with no incident radiation; the specimen had, however, received a total dose of 10^4–10^6 r. some months previous to these experiments). This slope gives $W = 1{\cdot}1$ eV.

Curve *b* is for the equilibrium induced conductivity under X-irradiation, at $R = 7$ r./min. The slope in this case corresponds to $W = 0{\cdot}5$ eV.

From this slope, it can be seen that the induced current increases by a factor of 50 between 300° and 400° K. The corresponding increase predicted using Rose's model of an exponential distribution of traps, with $\Delta = 0{\cdot}63$, is by a factor of 30. The agreement is fair, and would be improved by taking a slightly higher value for the number of available energy-states in the lowest levels of the conduction band.

A further demonstration of the applicability of this model is provided by the variation of Δ with temperature. If $\Delta = 0{\cdot}63$ at 65° C., then calculation predicts $\Delta = 0{\cdot}60$ at 110° C. and $\Delta = 0{\cdot}66$ at 20° C. A systematic variation of Δ was in fact observed, with $\Delta = 0{\cdot}55$ at 110° C. and $\Delta = 0{\cdot}71$ at 20° C. The measured variation is somewhat greater than the predicted variation; but this is probably because the experimental accuracy is rather low with such a small specimen.

Decay of induced current. The time-constant of decay varies slowly with temperature, showing the

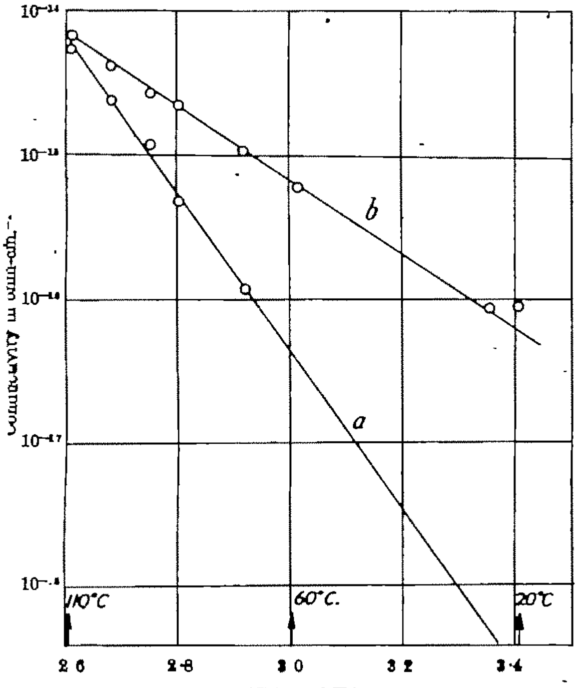

Fig. 1 (a). Without incident X-rays; (b) during irradiation

same general features as for polythene; at temperatures below 50° C., the current falls at first more rapidly, but after a few minutes more slowly, than at higher temperatures, so that complete decay takes longer at the lower temperatures. The time-constant decreases with increasing dose-rate. After a few minutes, the remaining current is inversely proportional to time, as for polythene. The magnitude of the time-constant is large. For example, the current induced in polythene at 80° C. falls to a enth of its initial value in 5 min., and to a hundredth n 25 min., whereas for polytetrafluoroethylene the fall to a tenth takes 6 hr. at the same temperature and dose-rate.

Comparison with other materials. The conductivity induced in polytetrafluoroethylene by X-rays is less han that induced in polythene under the same conditions by a factor of ten. Nevertheless, the fact hat the time-constant of recovery is much longer in polytetrafluoroethylene means that, so far as materials for ionization chambers are concerned, polythene and polytetrafluoroethylene are about equally undesirable. The induced conductivities in 'Perspex' (both red and colourless) and in some specimens of amber (for which we found Δ = 1) are less than that in polyetrafluoroethylene by a factor of ten, and in addition he time constants of recovery are very much shorter. This contrasting behaviour is likely to be a result of he different trap distributions.

Warner pointed out in 1949[5], from the expected complexity of molecular branching in polytetrafluoroethylene, that large induced conductivities would probably be observed under X- and γ-irradiation. Our results confirm this.

Liversage[6] has investigated the behaviour of polytetrafluoroethylene ionization chambers under X-rays. His information is too incomplete to corelate with the present results; but his general onclusions concerning this compound were the same: he insulating properties are seriously impaired by radiation in doses (and, we would add, at dose-rates) which leave amber relatively unaffected.

Photographic Recording of Cathode Ray Tube Traces

WHEN recording oscillograms by means of a camera, it is desirable to photograph at the same time the scale markings engraved on the oscilloscope graticule; if the graticule includes scales of distance along the two axes, direct measurements may then be made on a subsequent enlargement. It is also necessary to have some positive means of identification for each oscillogram, and the best method is one which allows the relevant data to be photographed at the same time as the cathode-ray tube trace.

A popular method of illuminating a 'Perspex' graticule is by means of edge-on lighting, but this does not provide any means for photographing, say, a written note, about the phenomenon to be recorded. To do so usually involves the use of ambient lighting, causing a loss of contrast which may not be permissible if the intensity of the trace is low.

A simple method by which it has been found possible to secure satisfactory illumination both of a graticule and a small slide of relevant data is by mounting two indicator bulbs behind the plane of the cathode-ray tube face, and over the gap between the internal graphite shield and fluorescent coating. This allows light to shine into the tube itself and upon the inside surface of the screen. The phosphor causes diffusion of the light, and possibly some fluorescence, resulting in an even illumination of the screen, graticule and small glass slide. This slide, which is ground on one side, is supported close to the tube face. Details of the oscillogram written on the slide in pencil can be clearly seen in the photo-

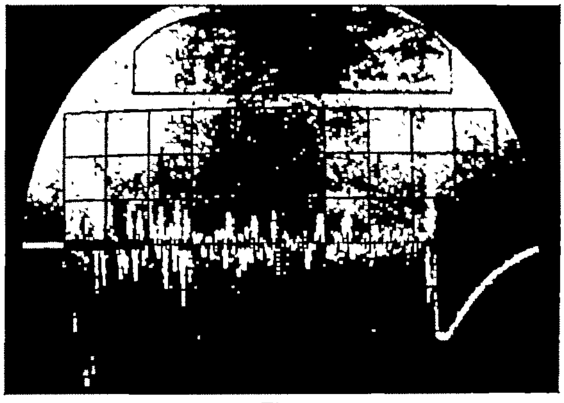

Fig. 1

graph (Fig. 1), and the visibility of even a faint trace is little affected by the illumination.

Unusual Doubling of Spectral Lines

When we were taking spectra of a high-frequency operated interrupted a.c. arc with the Zeiss autocollimation camera (Försterling set of 3 prisms, $f = 1{,}300$ mm.), a doubling of spectral lines was observed. The distances of the components increase with increasing refractive indices n and decreasing λ. It was ascertained that the trouble was due to oscillations of the prisms, which were in perfect synchronization as to period and phase with the cycles of the light source. These oscillations were caused by the vibrations of the housing of the arc source, which was placed too near the support of the spectrograph.

Such an explanation, however, seemed at first inconceivable, as differential deviations caused by oscillating prisms at minimum deviation should be zero for the region of the minimum rays and very inconspicuous in the other parts of the spectrum. But since there is also a Pellin–Broca prism of constant deviation in the prism set, things turned out rather differently. The reason for the difference is that the variation of the deviation ϑ with the variation of the incident angle α_1 is different for ordinary prisms and for Pellin–Broca types, namely,

$$\frac{d\theta}{d\alpha_1} = 1 \pm \frac{d\alpha_2}{d\alpha_1},$$

where the plus sign holds for ordinary prisms and the minus for the Pellin–Broca type (α_2 being the angle of the outgoing ray). The differential quotient $d\alpha_2/d\alpha_1$ is found to be

$$\frac{d\alpha_2}{d\alpha_1} = -\frac{\cos\alpha_1 \cos\beta_2}{\cos\beta_1 \cos\alpha_2},$$

β_1 and β_2 being the refracted angles within the prism. This quotient is equal to -1 for the ray of minimum deviation, and equal to a quantity $A_1 = f(\gamma, n_0, \Delta n)$ for rays the index of refraction of which differs from that of the minimum deviation (n_0) by Δn. We found, approximately,

$$\frac{d\alpha_2}{d\alpha_1} \doteq -\frac{1}{1 + C_0\Delta n} = A_1,$$

where

$$C_0 = \frac{2\sin^2\gamma/2\,(1 - n_0^2)}{n_0\cos^2\gamma/2\,(1 - n_0^2\sin^2\gamma/2)},$$

γ being the refracting angle of the prism, and n_0 the refractive index of the ray which is at minimum deviation. For 60° prisms C_0 reduces to

$$C_0 = \frac{8(1 - n_0^2)}{3\,n_0(4 - n_0^2)}.$$

A_1 holds only for a single prism. If there are several prisms of the same refracting angle and the same material, then for the prism k

$$A_k = \frac{1}{1 + (2k - 1)\,C_0\Delta n}.$$

For calculating the amplitude of the prism oscillation from the displacements of the spectral lines onl the region of the λ_0 of the minimum deviation ha to be considered. In addition, only prisms of constant deviation give a contribution to the effect i the sense that

$$d\vartheta = 2d\alpha_1.$$

In the present case these amplitudes range betwee 3·5′ for the original position of the arc source whe the effect was first observed, to about 8·5′ for position where the housing of the generator wa purposely pressed against the support of the spectrograph.

A fuller account will be published in *Ricerch Spettroscopiche*.

A Graphical Method of analysing Creep Curves

The retarded elastic extension of a high polyme under load can be represented by a series of Voig elements, each consisting of a spring and dashpot i parallel. With each element is associated a retardatio time, and a series of Voigt elements therefore give rise to a spectrum of retardation times. This spectru can be obtained from a creep curve by a method du to Alfrey[1]. In his method the extension is plotte against log-time, and the slope of this curve whe plotted against log-time gives a close approximatio to the spectrum.

When applying Alfrey's method to some cree curves of polyester, it was found that the spectr obtained were similar in outline to a Gaussian curv confirming a suggestion by Weichert[2] that such distribution of retardation times explained satis factorily the creep curves of some rubbers. Th graphical method of analysis described below sti uses the assumption of a Gaussian log-normal di tribution, but eliminates the need for tediou graphical differentiation and numerical calculation It provides a simple way of evaluating the thre constants involved and has been used to analyse th creep curves of polyesters, poly*iso*butylene, polythen and other high polymers. In all cases the experiment curves lie very close to those that can be calculate using the values of the three constants.

Applying Alfrey's method to a creep curve an assuming the resulting distribution to be Gaussia when plotted on a log-time scale, then it can b shown that

$$\frac{t\,d\gamma}{dt} = \frac{ch}{\sqrt{\pi}} \exp -\left(h \log \frac{t}{\tau_m}\right)^2,$$

where γ is strain, t is time, τ_m is maximum of th Gaussian curve, h is $1/\sqrt{2}\,\sigma$, σ is standard deviatio of the Gaussian curve and c is a constant.

When integrated from $t = 0$ to $t = t$ this gives

$$\gamma = c/2\,(1 \pm \operatorname{erf} h \log t/\tau_m),$$

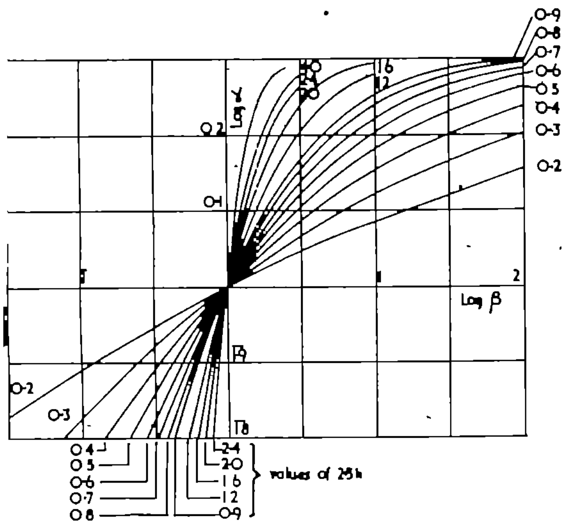

Fig. 1. Master curves

he positive sign referring to $t > \tau_m$, the negative ign to $t < \tau_m$.

It will be observed that when t is infinite then ' = c, and hence c is termed the equilibrium strain. A creep curve with no instantaneous extension and o viscous flow is therefore analysed in terms of three onstants, namely, the equilibrium strain (c) for a iven stress, the modulus of precision (h) of the etardation time spectra and the most common etardation time present (τ_m) in the deformation.

It has been found possible to develop a simple raphical method for the evaluation of the three onstants. If t is expressed in terms of τ_m, then a hange in τ_m results in a change in the time-scale of he experimental curve and moves a plot of γ against og t along the time axis with no change in shape. imilarly, if γ be expressed in units of $c/2$ and log γ s plotted against log t, then a change in c will move he curve along the extension axis with no change of hape. The shape of the curves of log γ against log t, herefore, will be independent of both τ_m and c and ill be determined entirely by h. It is therefore ossible to produce a set of master curves (Fig. 1) aving the general equation:

$$\log \alpha = \log(1 \pm \operatorname{erf} h \log \beta),$$

here $\alpha = 2\gamma/c$ and $\beta = t/\tau_m$.

The experimental curves when plotted as log-train against log-time will have a close fit in one and ne only of the curves, provided the distribution of etardation times can be satisfactorily described as Gaussian log-normal'. This has been found to be the ase with many types of polymers.

The general procedure for analysing experimental urves is as follows. The extensions are taken from he experimental curve at twenty to thirty points ogarithmically distributed along the time axis. A lot is then made on tracing paper of log-strain gainst log-time, using the same scale axes as for the aster curves. The unique position of this curve on he master set is then determined and the position f the point (log $\alpha = 0$, log $\beta = 0$) is noted as well s the value of h. When log $\alpha = 0$, $\alpha = 1$, and herefore the strain is $c/2$, and also log $\beta = 0$ and ence the time is τ_m. Both these values are read off rom the experimental axes.

With an experimental curve extending over three decades of time, $2{\cdot}3h$ is determined correct to at least 5 per cent, which causes τ_m to change by a factor of about 2 while the equilibrium modulus changes by ± 7½ per cent.

A Statistical Method of estimating the Periods of Incubation and Infection of an Infectious Disease

CERTAIN infectious diseases are supposed to have relatively constant incubation periods with short intervals of high infectivity. Greenwood[1] studied an idealized model, having a fixed incubation period and point-infectivity. He showed that a single primary case in a small family group of susceptibles would lead to a chain of binomial distributions of new cases. With measles, the observed distribution of the total size of family epidemics agreed closely with that predicted by the theory. Later, Wilson *et al.*[2], analysing new data with respect to the actual links of each chain, obtained only poor fitting of theory to observation. Following a hint of Greenwood's[3], Bailey[4] showed that satisfactory agreement could be restored by introducing a suitable distribution for the chance of infection in different families.

There has, however, always been difficulty in the 'chaining' of data, partly because the intervals between successive cases are liable to show appreciable variation, and partly because of the occurrence of multiple primaries. Some data had to be rejected before neat chains could be exhibited. An attempt has therefore been made to find a more realistic model of the process of infection, particularly one which would take account of the time-intervals between successive cases and which would not ignore parts of the data.

Attention was first turned to families with only two susceptibles, one of which was the index case. In some families this would be the only case; in others there would be a second case. Excellent detailed records of the right kind have been collected by Dr. R. E. Hope Simpson, of the Cirencester Public Health Laboratory Service[5]. Thus, in 264 families with two susceptible children under the age of fifteen, and at least one case of measles, 45 families had a single case, while for the remaining 219 the time-interval distribution between the two cases is shown in Fig. 1.

The distribution in Fig. 1 falls into two distinct parts: that marked A, which is presumably due to two primary cases, both infected from a single outside source; and B representing infection within the family. Consider the hypothesis of a variable incubation period, at the end of which there is a very short period of infection followed by the appearance of symptoms. The variance, v, of the curve B measures the variation of the incubation period. Curve A is the distribution of the difference, without regard for sign, between two incubation periods commencing at the same instant. The second

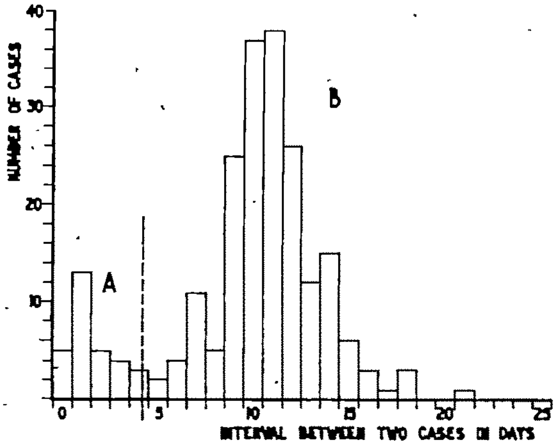

Fig. 1.- Distribution of time-interval between two cases of measles in 219 families with two susceptibles

moment, V, of this distribution about the origin should therefore be $2v$. It is a striking fact that in Fig. 1 V is only about $\frac{1}{2}v$. A new hypothesis is necessary.

Suppose now that after infection there is a latent period which is normally distributed with mean m and variance σ^2, and that it is followed by an extended period of infection of constant length a, after which symptoms appear. Following Hope Simpson[6], the incubation period is then constituted by the latent period plus the period of infection. When there is a single primary case, let the chance of the second susceptible being infected in time dt, during the period of infectivity of the first case, be $\lambda\, dt$. Let there be a total of N families. A of these have double primaries, and lead to curve A, for which we may put

$$V = 2\sigma^2. \tag{1}$$

B families have two cases, a primary and a secondary. The infection of the second case by the first occurs as a Poisson process operating over the limited time a, and this adds a variable time to the latent period to give the time-interval distribution of curve B. It can be shown that equating the mean $\bar{x}$, and the variance, v, of B, to their population values, gives the equations:

$$\bar{x} = m + \lambda^{-1} - a/\{\exp(\lambda a) - 1\}, \tag{2}$$

and

$$v = \sigma^2 + \lambda^{-2} - a^2 \exp(\lambda a)/\{\exp(\lambda a) - 1\}^2. \tag{3}$$

Finally, let there be C families with only one case. Setting this number equal to its expectation in the $(B + C)$ families without a double primary yields:

$$C/(B + C) = \exp(-\lambda a). \tag{4}$$

We can most easily solve successively for λ, a, m and σ from the following equations, which are derived from (1)–(4),

$$\lambda = \sqrt{\left\{1 - \frac{C(B + C)}{[B \log(1 + B/C)]^2}\right\}/(v - \tfrac{1}{2}V)}, \tag{5}$$

$$a = \lambda^{-1} \log(1 + B/C), \tag{6}$$

$$m = \bar{x} - \lambda^{-1} + aC/B, \tag{7}$$

$$\sigma = \sqrt{\tfrac{1}{2}V}. \tag{8}$$

Expressions for the standard errors are availab but are tedious to write down here. Arbitrari separating the distributions A and B by the vertic dotted line shown in Fig. 1, we find that for the data the mean and standard deviation of the di tribution of the latent period are 9·52 and 1·32 day while the period of infectiousness, a, is 3·84 days a λ is 0·43. Thus the incubation period has mean a standard deviation 13·36 and 1·32 days.

A more sophisticated treatment is by using t method of maximum likelihood, which provid efficient estimates, together with their standa errors, and a measure of the goodness-of-fit. It al enables us to dispense with an arbitrary assignme of border-line observations to curves A or B. is intended to describe this work more fully els where, and to include extensions to families wi more than two susceptibles.

Determination of Sour Orange Rootstock by Paper Chromatography

'QUICK decline', a devastating virus infection orange trees, was first found to be present in southe California in 1939, and by 1952 it had spread to s of the fourteen counties in which oranges are grow in California. Inoculation tests[1] demonstrated th tolerance to the virus varies with the variety of t rootstock on which the sweet orange is growing, an that the disease is likely to be fatal only if the roo stock is that of the sour orange (*Citrus aurantium* L. Because of this scion-rootstock relationship to t seriousness of the disease, which in one form or anoth is widely spread throughout the citrus-growing are of the world, a method for the detection of the so orange rootstock in established orchards is of co siderable significance.

In this study more than 2,400 ascending a descending chromatograms were made of ten varieti of citrus seedlings, and nine varieties of rootstoc budded with valencias and the same nine budded navel oranges. The ten varieties of seedlings we the Palestine sour, Wolf sour, bittersweet, Robbi grapefruit, Robbins sweet, Wieland rough lemo Cleopatra mandarin, tangelo (variety ?), Troy Citrange and Rubidoux trifoliate orange. T varieties of rootstocks budded to valencias and nave which were planted in 1927 included the Brazili sour, Rubidoux sour, Duncan grapefruit, Koetha sweet, rough lemon, Cleopatra mandarin, Sampso tangelo, Troyer citrange and trifoliate orange.

Fresh pieces of the entire thickness of the bar approximately one-eighth of an inch square, are c from the roots that are to be tested. The piec are placed cambium side down on Whatman No. filter paper and are mashed or struck with a hamm

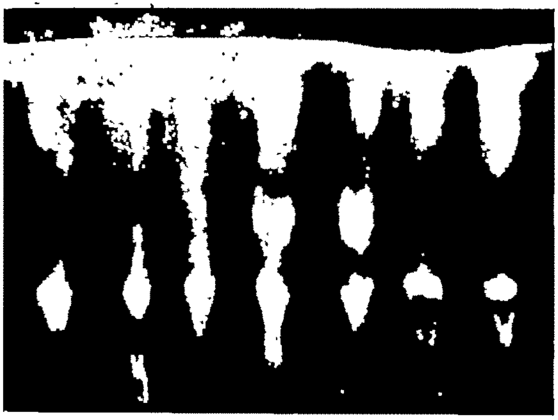

Fig. 1. Chromatograms of seven varieties of seedling citrus rootstocks, from left to right: Troyer citrange, Trifoliate orange (Rubidoux), Cleopatra mandarin, Sour (Palestine), Sour (Wolf), Sweet (Robbins), Grapefruit (Robbins). The solvent was *n*-butanol – acetic – water mixture. The chromatograms were sprayed with ninhydrin, photographed with long-wave ultra-violet light on Plus *X* film and Wratten *K2* filter

order to squeeze out the juices of the bark; or an ation of the bark may be made in the butanol ixture described later and drops of it placed on the ter paper. This is of particular value when working ith the small roots of seedlings[2].

Of the twenty-six different solvents that were sted, the most satisfactory one is the organic phase a mixture of 4 parts of normal butanol, 1 part acial acetic acid, and 5 parts of water. After the lvent has ascended six or seven inches, the paper dried and sprayed with a 0·2 per cent solution of nhydrin in 95 per cent ethanol. The colour is lowed to develop for 24 hr.

Under a long-wave ultra-violet lamp (3600 A.) the nhydrin-sprayed chromatograms of the sour orange otstocks show a yellowish fluorescent, 'flame-like' ot with an R_F value of approximately 0·50. Fig. 1 ows the chromatograms of seven seedling rootstocks. he fourth and fifth ones from the left are those of o varieties of sour orange. Commercial rootstocks of citrus trees that are not 'sour' do not give the 'flame reaction'.

Table 1

	Solvent	Quality of 'flames' on Whatman No. 1 filter paper when sprayed with ninhydrin
1	*n*-Propyl (2): 5 per cent ammonium hydroxide (1)	None
2	*n*-Propyl (70): glacial acetic (15): water (10)	Hazy
3	*iso*-Propyl (2): 5 per cent ammonium hydroxide (1)	None
4	*iso*-Propyl (70): glacial acetic (15): water (10)	Hazy
*5	*n*-Butyl (4): glacial acetic (1): water (5)	Very good
*6	*n*-Butyl (4): propionic acid (1): water (5)	Very good—equal or better than 5
7	*n*-Butyl (80): 25 of (10 con. formic + 1,500 water)	Good
8	*n*-Butyl (80): 25 of (10 con. hydrochloric + 3,000 water)	Fair
*9	*sec.*-Butyl (4): glacial acetic (1): water (5)	Fair
*10	*iso*-Butyl (4): glacial acetic (1): water (5)	Good
11	*tert.*-Butyl (70): con. formic (15): water (10)	All rootstocks appear similar
12	*tert.*-Butyl (70): glacial acetic (15): water (10)	Hazy
*13	Amyl (4): glacial acetic (1): water (5)	Poor; small R_F values
*14	Octyl (4): glacial acetic (1): water (5)	Nothing
*15	Butyl acetate (4): glacial acetic (1): water (5)	Nothing

* Mixture separates; only the top phase is used

Table 1 shows that the three four-carbon, water-insoluble butyl alcohols (namely, *n*-butyl, *sec.*-butyl and *iso*-butyl) give the 'flame reaction' with sour orange rootstocks. *Tert.*-butyl, which is water-soluble, produces a haziness in the 'flame' area with acetic acid, and when formic acid is used all rootstocks have similar and indistinctive chromatograms.

'Sour' rootstocks form 'flames' with the organic phase of *n*-butyl alcohol – water mixtures when the *p*H is adjusted between 2·4 and 3·0 with a number of acids including acetic, propionic, formic and hydrochloric.

This method makes it possible to determine which, if any, of the trees in a citrus orchard are growing on sour orange rootstock, and therefore susceptible to the virus of quick decline.

I wish to thank Dr. Carl Wolf, of the La Cienega Nursery, Fillmore, California, and Dr. W. P. Bitters, of the University of California Citrus Experiment Station, Riverside, California, for supplying rootstocks of known pedigrees. I also acknowledge valuable discussions with my colleague Dr. Frank L. Lambert.

Frequency Distribution of the Concentrations of Elements in Rocks

IN a recent communication[1], Ahrens reported some data on the frequency distribution of some of the elements in igneous rocks, and enunciated a geochemical law to the effect that the concentration of an element in a specific igneous rock is lognormally distributed. Observations have been made at the Fuel Research Station of the Department of Scientific and Industrial Research on the trace elements in coals and coal ashes. Our data, although applying to this special type of sedimentary material, have suggested certain considerations which appear to be relevant to the subject of Ahrens's communication.

In dealing with the concentrations of a minor constituent expressed as a proportion of the whole, it is clear that there are far greater possibilities for the data to vary to higher values than to lower values. It would be expected, therefore, that such data would have a positive skew distribution which might, to some extent, simulate the lognormal. The position is different when considering the concentrations of a major constituent of a material. In a system with only two main components, it is clear that if the distribution of concentration of one of these has a positive skewness then that of the other will have a negative skewness, which will be a mirror image of the distribution of the first constituent. The position is less well defined when the number of major constituents is increased; but here again the distribution of the data for at least one of the constituents will tend towards a negative skewness. This may be illustrated by data for the three most abund-

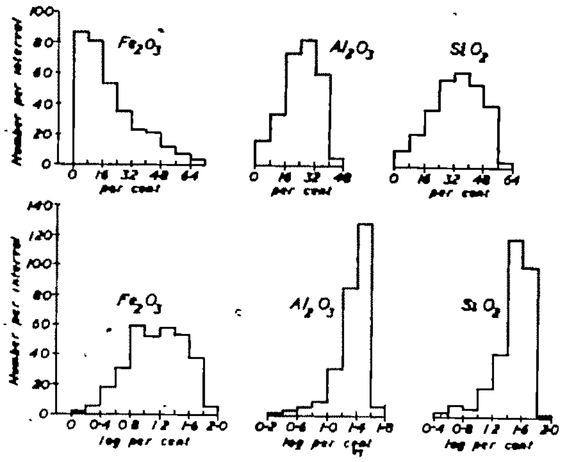

Fig. 1. Frequency distributions of the major constituents of coal ash. Crown copyright reserved

ant radicals in coal ash, namely, SiO_2, Al_2O_3 and Fe_2O_3 (Fig. 1): the figures for Fe_2O_3 follow very approximately a lognormal distribution, but those for SiO_2 and Al_2O_3 exhibit a slight negative skewness for the untransformed variable and a marked negative skewness for the logarithmic derivative. It is assumed that the law suggested by Ahrens was meant to apply only to minor constituents, but the above considerations raise the interesting point as to the level of concentration at which the distribution of the data for an element might begin to lose its positive skewness.

The same considerations also indicate the possibility that even a trace constituent of a rock might fail to follow a lognormal, or even an approximately lognormal distribution. This could arise if the trace element were closely bound to one particular ma constituent which itself failed to exhibit a positi skew distribution. Ahrens has shown that the co centrations of many trace elements in igneous roc follow an approximately logarithmic distributior but if a law, rather than a working rule, is to enunciated, it would be desirable to show that departure from a strictly lognormal distribution h been observed or might be expected. In this co nexion it appears that the data quoted for rubidiu (*loc. cit.*) show some evidence of a slight negati skewness when in the logarithmic form.

The data obtained at the Fuel Research Station the occurrence of about twenty trace elements more than two hundred British coals have provid many examples of an approximation to a lognorm distribution. This is exemplified by the diagran for the distribution of concentration of copper coal, on a linear and logarithmic basis (Fig. 2 Other elements, such as vanadium (Fig. 2), exhib a certain amount of negative skewness in t distribution of the logarithmic derivative, althou it is clear that the distribution is nearer to the lo normal than to the normal. It has been possible some cases to relate these differences to the differe parent materials responsible for introducing t elements into coal. This and other aspects of su data for coal will be discussed in greater det elsewhere.

This work forms part of the programme of t Fuel Research Board of the Department of Scienti and Industrial Research and is published by pe mission of the Director of Fuel Research.

Light Cages for Birds

THE principle of bird-cages using a screen bright light, but no glass, wire or other mechanic means of preventing escape, was arrived at approxin ately simultaneously and independently in the zo at Antwerp and Basle.

I do not wish to claim priority for the discover of this principle of display.

H. HEDIGER

Copenhagen.
June 25.

[Dr. Hediger, who is director of the Zurich Zo logical Gardens, in his book "Wild Animals Captivity" (London, 1950) wrote on p. 58: "Follo ing the conference of zoo directors in Rotterdam 1946, the author had a conversation with the ne director of the Antwerp Zoo about this improve type of cage. That same year he constructed similar experimental cage in the Basle Gardens. Th was officially visited in 1947 when the conference zoo directors met in Basle. In 1948 cages of th sort were opened to the public for the fir time in the modernized aviary in the zoologic gardens at Antwerp and claimed as an Antwe discovery".]

FORTHCOMING EVENTS

Monday, July 19

St. Bartholomew's Hospital Medical College (in the Physiology cture Theatre, Charterhouse Square, London, E.C.1), at 5.30 p.m.—of. Seymour S. Kety (U.S.A.): "The Theory and Applications of art Gas Exchange".

Monday, July 19—Tuesday, July 20

University of Birmingham, Department of Metallurgy (at e University)—Conference on "Mechanical Effects of Dislocations Crystals".

Monday, July 19—Friday, July 23

Department of Atomic Energy (at Oxford)—Radioisotope nference.

Wednesday, July 21

Society for Analytical Chemistry (at the Royal Institution, Albemarle Street, London, W.1), at 6 p.m.—Special Meeting on "The Use of Perchloric Acid in Analytical Chemistry".

Thursday, July 22—Friday, July 23

Society for the Study of Fertility (at the Meeting House of e Zoological Society of London, Regent's Park, London, N.W.1)—nference.

Friday, July 23—Saturday, July 24

Nutrition Society (in the Dobbie Lecture Theatre, University llege of North Wales, Memorial Buildings, Deiniol Road, Bangor, aernarvonshire)—Symposium on "The Efficiency of Food Conversion Farm Animals".

APPOINTMENTS VACANT

Applications are invited for the following appointments on or fore the dates mentioned:

Assistant Lecturer (with special qualifications in petrology) in he Department of Geology—The Registrar, University College Wales, Aberystwyth (July 20).

Head (with a good honours degree and/or an appropriate professional alification, and senior experience in a technical college or university) the Engineering Department, and Head of the Science epartment, Royal Technical College of East Africa, Nairobi—The cretary, Advisory Committee on Colonial Colleges of Arts, Science d Technology, 1 Gordon Square London, W.C.1 (July 20).

Research Fellow (with previous research experience) in Geology -The Registrar, The University, Edgbaston, Birmingham 15 (July 21).

Assistants (2) (with a degree in agriculture, botany or agri- ltural botany, and a special interest in grasses), for recording getation changes resulting from the death of rabbits through the read of myxomatosis—The Establishment Officer, The Nature nservancy, 19 Belgrave Square, London, S.W.1 (July 22).

Senior Scientific Officer (with a degree of high standard in athematics or one of the physical sciences) in the Department of pply, Research and Development Branch, Central Staff, Mel- urne, for research activities with the Australian Army Operational search Group, involving the scientific study and analysis of a wide nge of operational problems including the assessment of new eapons—The Senior Representative (A.P.19), Commonwealth of ustralia, Department of Supply, Australia House, Strand, London, .C.2 (July 23).

Physicist or Fuel Technologist (preferably with a university gree or equivalent qualifications) to undertake miscellaneous in- stigations on the physical properties of fuels and refractories—The ivisional Chief Scientist, National Coal Board, Roundwood Colliery fices, Parkgate, Rotherham (July 23).

Assistant Lecturer (preferably with qualifications in physical d inorganic chemistry) in the Department of Chemistry—The gistrar, The University, Hull (July 24).

Research Fellow (preferably with experience in use of mass ectrometer or molecular stills) in the Department of Chemistry, r the investigation of evaporation processes, with special reference the break-up of complex molecules—The Registrar, The University, dgbaston, Birmingham 15 (July 24).

Lecturer (with a university degree, or equivalent and considerable aching experience) in Mathematics—The Principal, Royal Aircraft tablishment Technical College, Farnborough, Hants (July 26).

Research Fellow in Theoretical Nuclear and Elementary rticle Physics—The Professor of Natural Philosophy, The Univer- y, Glasgow (July 26).

Lecturer (with special interests in animal husbandry) in Agri- lture—The Registrar, The University, Nottingham (July 28).

Demonstrator in the Department of Animal Pathology—e Secretary, Appointments Committee of the Faculty of Biology B", Department of Pathology, Tennis Court Road, Cambridge uly 31).

Lecturer or Assistant Lecturer (with a special interest in the nnective tissues) in Pathology—The Registrar, The University, anchester 13 (July 31).

Lecturer (with experience in hydraulics and public health gineering (water supply, sewage treatment, etc.), and able to lecture d organize laboratory and research courses on these subjects) in vil Engineering—The Registrar, King's College, Newcastle-upon- ne (July 31).

Research Assistant (with an honours degree in metallurgy or ysical chemistry) to the Joseph Lucas Research Fellow in Electrometallurgy, to undertake research on the growth and properties of electrodeposits; and a University Research Fellow (graduate in metallurgy, engineering or a related science), to engage in research in the field of metal working—The Registrar, The University, Edgbaston, Birmingham 15 (July 31).

Research Officer (Geomorphologist) (with a university honours degree in science, with geology as a major subject, or equivalent qualifications, and preferably with experience in field surveys and the interpretation of aerial photographs) in the Land Research and Regional Survey Section of the Commonwealth Scientific and Industrial Research Organization, to be a member of a scientific survey team which is conducting potentiality surveys in the Papua–New Guinea region—The Chief Scientific Liaison Officer, Australian Scientific Liaison Office, Africa House, Kingsway, London, W.C.2, quoting 570/31 (August 7).

Scientist, Grade III (with a good honours degree or equivalent in a science subject, and preferably with a sound background in geology and chemistry), in the National Coal Board Survey Laboratory, Birmingham, for work which will include the preparation of detailed reports on the structure and physical and chemical properties of the coal seams covered by the laboratory—The National Coal Board, Establishments (Personnel), Hobart House, Grosvenor Place, London, S.W.1, quoting TT/804 (August 7).

Lecturer in Plant Physiology at Auckland University College (University of New Zealand)—The Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1 (New Zealand, August 10).

Lecturer in Classical Archæology at the University of Sydney, Australia—The Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1 (Sydney, August 14).

Lecturer in Dressing of Minerals and Coal Preparation, to undertake and promote research, lecture on coal preparation and mineral dressing, and assist in the supervision of laboratory work—The Registrar, The University, Leeds 2 (August 14).

Lecturer (with special qualifications in physical or inorganic chemistry) in Chemistry—The Secretary, Bedford College (University of London), Regent's Park, London, N.W.1 (August 27).

Lecturer (preferably with qualifications in the fields of human and regional geography) in Geography, at Victoria University College, Wellington, New Zealand—The Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1 (New Zealand, August 31).

Senior Lecturer in Chemical Engineering, and a Lecturer in Geography, at the University, Cape Town—The Secretary, Association of the Universities of the British Commonwealth, 5 Gordon Square, London, W.C 1 (August 31).

Reader in Pure Mathematics at the University of Oxford—Prof. E. C. Titchmarsh, Mathematical Institute, 10 Parks Road, Oxford (September 15).

Senior Research Officer (with a doctor's degree in physics), and Research Officers (with an honours degree in physics or equivalent, or a degree in light current engineering) in the Nuclear Physics Division of the National Physical Laboratory, Pretoria, South Africa—The South African Scientific Liaison Officer, Africa House, Kingsway, London, W.C.2 (Pretoria, September 15).

Assistant Experimental Officer (with a pass degree or H.N.C. or equivalent in chemistry, and preferably with experience of analysis), in the Department of Scientific and Industrial Research, Fire Research Station, Boreham Wood, Herts, for duties which will involve chemical analysis, assistance in research on fire extinction, and the investigation of industrial fire hazards—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S W 1, quoting F.355/54A.

Assistant Lecturer, Grade B, in the Department of Chemistry, and an Assistant Lecturer, Grade B, in the Department of Mathematics, at the College of Technology and Commerce, Cardiff—The Director of Education, City Hall, Cardiff.

Assistant Lecturer, Grade B (with a good degree in botany and zoology) in the Department of Biology, and an Assistant Lecturer, Grade B (with an honours degree in chemistry, and able to teach one branch of chemistry, preferably physical or inorganic, up to B.Sc. Special Chemistry standard) in the School of Chemistry—The Registrar, College of Technology and Commerce, The Newarke, Leicester.

Biochemist (Senior Scientific Officer or Scientific Officer grade), for research on the composition and metabolism of leaves—The Secretary, Rothamsted Experimental Station, Harpenden, Herts.

Electronics Engineers and Physicists, Scientific Officer grade (with first- or second-class honours degree or equivalent) or Assistant Experimental Officer grade (with H.S.C. (science) or equivalent), at Ministry of Supply Experimental Establishments at Farnborough, Hants, Malvern, Worcs, Sevenoaks, Kent, and elsewhere, mainly in Southern England, for duties which include research, development or design of telecommunications and radar equipment; guidance and control systems; instrumentation for a variety of research problems—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S.W.1, quoting D.296/54A.

Laboratory Assistant (female) (with a degree in pure botany, agricultural botany, or equivalent) in the Plant Pathology Section of the Department of Agriculture, Scott Agricultural Laboratories, Kenya—The Director of Recruitment, Colonial Office, Great Smith Street, London, S.W.1, quoting BCD.63/7/09.

Lasdon Research Fellow (with an honours degree in one of the biological sciences, and some research experience) to work on the chemotherapy of tuberculosis, under the direction of Dr. V. C. Barry, in the Laboratories of the Medical Research Council of Ireland—The President, University College, Dublin, Ireland.

Lecturer in Pharmaceutics at the Technical College, Bradford—The Director of Education, Town Hall, Bradford 1.

Lecturer (with a degree or equivalent qualification, and some industrial experience, preferably in the field of electrical measurements) in the Department of Electrical Engineering—The Secretary, Royal Technical College, George Street, Glasgow, C.1.

Lecturer (with special qualifications in pure mathematics) in Mathematics—Head of the Mathematics Department, Imperial College, London, S.W.7.

Metallurgist (with a first- or second-class honours degree in metallurgy, or A.I.M., or equivalent, with at least three years industrial experience), to advise on selection of materials for use on specialized plant; to deal with day-to-day metallurgical problems arising on design work; and to maintain liaison between development laboratories and design offices—Department of Atomic Energy, Industrial Group Headquarters, Risley, Warrington, quoting 693.

Metallurgists to study industrial problems on the melting, casting and fabrication of non-ferrous metals—The Secretary, British Non-Ferrous Metals Research Association, 81 Euston Street, London, N.W.1.

Physical Chemist (with post-doctorate or equivalent research experience, and preferably with experience in vacuum techniques and a knowledge of electronics), to study evaporation from solid surfaces—The Laboratory Superintendent, Department of Chemistry, The University, Edgbaston, Birmingham 15.

Protozoologist (with a medical or veterinary degree or diploma registrable in the United Kingdom, and with two years postgraduate research experience, and a sound knowledge of protozoology), with the East Africa Tsetse and Trypanosomiasis Research and Reclamation Organization, to undertake research in the human and animal trypanosomes—The Director of Recruitment (Colonial Service), Colonial Office, Sanctuary Buildings, Great Smith Street, London, S.W.1, quoting BCD.195/188/01.

Reader or Senior Lecturer in Agricultural Genetics and Plant Breeding; Lecturer in Agricultural Genetics and Plant Breeding, and a John Mortlock Research Fellow, in the Department of Agronomy, Waite Agricultural Research Institute, University of Adelaide, Adelaide, South Australia—The Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1.

Research Assistant (graduate (honours or pass degree), with qualifications in botany or biochemistry) **in the Department of Botany**, to work on the physiology of plant growth hormones and inhibitors—George Harrison Professor of Botany, The University, Manchester 13.

Scientific Officers (with a first- or second-class honours degree in physics or equivalent qualifications) for (*a*) to undertake studies of the mechanical effects of stresses applied to atomic weapons (Ref. 109/WGH/34); (*b*) to work in close conjunction with a group of chemists engaged in research on radioactive materials (Ref. 161/WGH/34), and (*c*) for work of a qualitative and quantitative spectrographic analysis of inorganic substances—The Administrative Officer (Recruitment), Atomic Weapons Research Establishment, Aldermaston, Berks, quoting appropriate Ref. No.

Senior Entomologist or Entomologist (with a university qualification with entomology as a special subject, and for the senior post, some years experience) **in the Veterinary Department**, Kaduna, Nigeria, for work on the eradication of tsetse fly in relation to trypanosomiasis of cattle—The Director of Recruitment (Colonial Service), Colonial Office, Great Smith Street, London, S.W.1, quoting BCD.67/14/07.

Teachers (with high qualifications and able to teach to advanced level and university scholarship standard) **of Mathematics and Chemistry**—The Headmaster, Dartington Hall School, Totnes.

SCIENTIFIC ADVANCES AND INDUSTRIAL DEVELOPMENT

IN an address on science and our industrial future to the Parliamentary and Scientific Committee on May 11, Sir Ben Lockspeiser reviewed some of the ways in which scientific advance has modified profoundly the pattern and character of manufactured goods in international trade. The decline in importance of the older industries in favour of the metal-using industries and those yielding engineering products of a much higher capital value in relation to raw materials used is, he believes, to the advantage of Great Britain. We have the scientific power, the mechanical skill, ingenuity and design ability required; but we can only adapt ourselves to changing conditions by deliberate forethought and concentration of purpose. Sir Ben instanced some of the new opportunities presented to the gas scientists and engineers and in the manufacture of chemicals from oil, as well as in industrial microbiology; but his main stress was laid on the far-reaching consequences which might flow from the applications of the electronic computor in its fully automatic general purpose form. Such machines make considerable demands for the use of scarce and expensive materials such as germanium. A new atomic battery which uses a silicon transistor might be no more than a scientific curiosity; but it could equally prove the first step in the direct conversion of atomic radiation to electrical power.

The full exploitation of transistors, special circuits and electronic innovations generally would no doubt promote the coming of the fully automatic factory. It would also have a profound effect on the development and conservation of natural resources and on human relations in industry. We are, Sir Ben said, within sight of being able to remove the boredom of repetitive routine work, and in the future people may be called upon more and more for creative activity which machines cannot give. This would undoubtedly involve social strains. It could, for example, call for a larger number of highly skilled technicians associated with a comparatively small number of unskilled workers. Already the diminishing differential in pay between skilled and unskilled workers tends to discourage the young worker from serving the years of apprenticeship or training necessary to acquire skill or technique, and the situation envisaged by Sir Ben may well require considerable readjustment of such differentials in pay.

We would require also a much clearer understanding of human behaviour. The Department of Scientific and Industrial Research, said Sir Ben, is already studying the effect of automatic control on human relations in industry, on the skills required and on the problems of management, organization and control, and he referred to an exploratory research project which the Human Relations Committee, established last year jointly by the Department and the Medical Research Council, is sponsoring at the University of Cambridge. This project will cover such matters as the skills required to operate automatic control techniques, problems of adaptation and re-learning by operators, the attitudes of workers to the changes and the implications for management structure and communication.

Many old conceptions on both sides of industry are still current in Great Britain, although completely out of step with modern technology; a considerable revolution in thought by employers' federations, trade unions, and the nation as a whole must be faced if we are to keep our place as an industrial nation. Scientists may need to broaden their outlook; but we may well advance more quickly in the field of human relations if, to the classical tradition in education, is added a working knowledge of the scientific method, thus enabling more people to bring the rich background of the humanities to the systematic study of human relations. The problem must be tackled realistically, making use of knowledge from the social as well as from the physical sciences.

As Sir Ben pointed out, we cannot expect anybody to invest the large capital required for these new developments without some assurance that they will be operated fully and properly. It is this that gives such importance to the study of the human factors facilitating and restricting the introduction of new production techniques and methods. At the University of Liverpool, for example, the Human Relations Committee is sponsoring an investigation designed to throw light on the factors which tend to facilitate or impede change, the kinds of relationship which tend to promote the absorption of change, and the methods by which change can be absorbed with the minimum disturbance of human relations and welfare. Another study, at the Tavistock Institute of Human Relations, seeks to clarify particularly the way in which technological factors and social or works organizations are related to each other, while a fourth project sponsored by the same Committee at the University of Edinburgh is on the adaptation of the management structure in several Scottish firms to their new activities in the development of electronic equipment, and the adjustment of individuals and groups to new requirements and routines.

The rate of technological innovation is likely to be the most significant factor determining industrial productivity in the future, but the study of human relations is only one of the ways in which technological innovation makes great demands on management. Some of the wider implications have been discussed by Dr. Alexander King, chief scientific officer, Intelligence Division, Department of Scientific and Industrial Research, in a recent article in *The Manager*. Dr. King was concerned with the personal qualities which are needed for wider application of science in industry and the rapid adaptability of industrial design to need and to changing conditions. He recognizes that technological development depends on other factors also, including investment policy and the availability of capital, which are in turn related to the level of taxation and general economic conditions, apart from the psychological conditions under study by the Human Relations Committee and that since established by the Royal Society of Arts, the British Association and the Nuffield Foundation. He insisted, nevertheless, that, at the least, the management of a firm must possess a general background understanding of science and sufficient knowledge of its own expanding technology to enable a balance to be struck between the scientific and economic factors. All major technological development depends on striking such a balance—also, as we are now realizing, on striking it with the social or psychological factors also. There must be, Dr. King says rightly, some point in the councils and management of industry where scientific and technical ideas can be considered with full understanding in making decisions on policy.

Hitherto, admittedly, failure to build a bridge between manager and scientist has been due as frequently to the narrowly specialized attitude of the scientist as to the lack of appreciation of scientific needs by the manager. It is a problem of communication which has been considered at more than one conference organized by the Federation of British Industries in recent years. As yet we know little about the best training for the scientific administrator. The ability to find or select new knowledge, to recognize its significance and the need for change is only one aspect. The manager must also possess sufficient will and initiative to effect the change required, including the persuasion of others, from directors to work-people, to accept the innovation and to co-operate.

As yet we do not really know to what extent the smooth flow of science to industry is blocked by traditional attitudes, bordering upon prejudice, at different levels, or among the workers, nor how far such resistance to change arises from the structure and psychology of the firm or the general thinking of the industry. There are variations in the climate of opinion here, ranging from that current in the family firm, through the large private enterprise to the executive board of a nationalized industry, which may repay study, equally with those rational or irrational factors noted by Dr. King on which managements customarily base their decision to adopt an innovation.

The way in which existing methods of finance stimulate some kinds of innovations and inhibit others, or the extent to which monopoly and free competition, respectively, force or retard the adoption of new methods to the interest of the consumer and the economy, may well involve much more research before decisions are based on knowledge rather than prejudice. The influence of labour costs as an incentive, and the effect of technological change on the general level and distribution of employment are commonly matters of opinion rather than factual inquiry, and there are also such general differences of opinion as that noted by Dr. King in regard to the advantage of being the first in the field with an innovation. In the United States, this is almost axiomatic. In the United Kingdom, on the other hand, it is often held that the first firm to introduce a major innovation bears an undue share of development costs which are escaped by competitors who ome in later when the change is made and a new market created. Each of these beliefs may or may not be valid in the different circumstances prevailing in the two countries. Clearly it would be of great value to British industry to determine that validity, as would more accurate knowledge of effects of echnological innovation on the general level and distribution of unemployment assist in overcoming he opposition of work-people to development, and in reconciling their interests with the increase of productivity and the interest of the community. Nor does the small firm escape such problems. As Dr. King showed, the small firm has advantages as well as disadvantages, compared with the large firm, in applying new knowledge. The one essential need of he small firm is at least one reasonably well-trained echnologist to keep in touch with the advances of echnology and the best general practice of the industry, and to help put these to productive ffect.

Dr. King's paper provides the perspective against which a sounder judgment may be made of some of he projects now being sponsored by the Human Relations Committee with Conditional Aid Funds, particularly those which at first sight might appear o be of dubious value, like the study of the flow of information in industrial organizations. The special eference to the making of decisions relating to production made in this project is liable to give an impression which may well be entirely unjustified.

Both Sir Ben Lockspeiser's address and Dr. King's paper, like the recent inquiry sponsored by the Manchester Joint Research Council, point to he importance of getting more men into the management of British industry competent to meet the scientist and technologist on equal terms, and to assess the scientific and technological factors along with the economic, financial and social factors in development; such men would also be able to see hat full use is made both of the results of scientific research and of the opportunities which new scientific techniques, such as operational research, afford in management. Nevertheless, training for management, or the training of the technologist, is only one spect of the problem. There are personal qualities involved, and perhaps the scientist or technologist will seldom prove to possess administrative gifts of high order. The more talented he is as an investiator, the more likely his gifts are to find their fullest xpression in research and its immediate direction. There are limits also to the use which can be made f such techniques as operational research and improvements in communication.

What needs to be remembered is that there have been changes in the way in which technical innovation works in the British economy, of which the establishment of the National Research Development Corporation in 1949 is one sign. Sir Henry Tizard ommented on this in his Messel Memorial Lecture at Aberdeen in 1952, and its implications were disussed in a recent supplement, "Research for ndustry", in *The Economist*. Sir Henry judged that Government appropriations supply more money for engineering development than all the engineering industries put together, and the main stimulus to British engineering of the highest quality in recent years has come, he said, from defence research and development rather than from private enterprise. Even then the question could be asked whether the taxpayer would in future have to undertake the risks which formerly were taken by private enterprise. Sir Henry said frankly that he was not happy at the principle behind the National Research Development Corporation, and he did not like to think that the leaders of British industry were becoming less adventurous.

Something more than research on the factors affecting the speed at which technological innovation proceeds is required to answer the questions which the growing dependence of research upon government support raises. Those questions are a matter of concern in the United States quite as much as in the United Kingdom; nor should it be assumed that the balance between public and independent or private support should be the same in both countries, still less that the balance between applied and fundamental research should be the same. It may well be true that, as *The Economist* suggests, Britain should be devoting a much greater proportional effort to research than the United States. It may also be true that the proportion devoted here to applied research and development requires to be increased relative to that devoted to fundamental research. The major issue to be raised first, however, is whether the direction of our research effort, as well as its distribution, is likely to be wise if it continues to be financed so preponderantly from government sources.

Admittedly, in such new fields as atomic energy the main research effort for some time to come is likely to remain entirely under State control; but with the Ministries most concerned with research and development almost trebling their expenditure in the past four years, there is, in the first place, some risk that the continuance of such dependence on State support may warp the direction of research effort away from the lines that ordinary economic demand would indicate. It is no answer to point out that defence research may and does assist in the commercial development of some valuable technical innovations. The price which has to be paid in the retardation of technical progress elsewhere for the civil developments which defence research brings in its train should be remembered. Often it cannot be estimated, particularly if we think in terms not of money or materials, but of the even scarcer factor—outstanding scientists.

The second factor which Sir Henry Tizard had chiefly in mind is even more important. Can we rely on a government department to select the right targets and to take the risks inherent in technological development as wisely and as boldly as the individual entrepreneur? Arguments advanced in the debates on the Atomic Energy Authority Bill should give pause to any such thinking. The weakness, if not fallacy, of any such assumption was demonstrated in a pamphlet, "The Chemical Industry and Challenge to Britain", issued by Imperial Chemical Industries, Ltd., last February for the information of stockholders and employees. If British industry is defective in initiative, in enterprise or in judgment, its weaknesses are unlikely to be rectified from without the industry by any public body.

This is not to say that the National Research Development Corporation will not perform useful functions, or that self-financing and institutional investment will not promote as many risks as saving by the individual investor. But they may not, and if Britain is to devote the maximum share of her industrial resources to research, and if her present industrial economy is to be as effective in promoting technical advances as those out of which it has emerged, it would be prudent to see that individual initiative and originality have their opportunity to contribute to the scientific industries of the future. Moreover if, as the investigators of the Manchester Joint Research Council found, the personalities of directors and managers at the highest level in a firm and the attitudes to the scientific approach to production are the dominating factor determining the use of new knowledge or the adoption of new ideas, the decisive factor will be the industrial and social climate of opinion which the late Dr. K. T. Compton stressed in his address to the Parliamentary and Scientific Committee last February.

In forming such a climate of opinion in which technological progress and productivity thrive, education, and especially higher technological education, as Dr. Compton pointed out, is of far-reaching importance. More light on the factors which assist or retard the adoption of technological innovation in industry will be welcome, and it is possible that some of the investigations already in progress in this field may yield results which will enable measures for the encouragement of enterprise and originality, or the removal of hindrances to change, to be based on factual knowledge rather than on political theory or prejudice. The essential task, however, is that of education, and education at all levels affecting the climate of opinion within which the scientist and technologist work. If by the expansion of higher technological education and the broadening of the content of education, not only of the scientist and technologist but equally of the administrator, the industrialist, the manager and the trade unionist, we encourage the development of such a climate of opinion that the implications of technological change for Britain's industrial and economic future are clearly understood, it will become relatively less important whence the main support for research is derived. The direction of research and the application of its results are likely to lie, in that event, in the hands of those competent to appreciate the significance of new discoveries, to evaluate the complex scientific, technical, economic and social factors involved and to secure the co-operation of all concerned in and affected by the technological changes they initiate.

LYSENKO IN PERSPECTIVE

Agrobiology

Essays on Problems of Genetics, Plant Breeding an
Seed Growing. By T. D. Lysenko. (Translated from
the Fourth Russian edition.) Pp. 636+12 plate
(Moscow: Foreign Languages Publishing House
London: Collet's Holdings, Ltd., 1954.) 15*s*.

BRITISH research workers regard polemical pape with suspicion, not to say distaste. This circumstance has engendered among us a delicate ar of scientific (as distinct from literary) criticism. A critic is permitted to demonstrate that his colleague' facts are incorrect. He can go further and demonstrate that his colleague's hypotheses are inconsisten with the facts. But he cannot with propriety g further still and impute motives or reasons for hi colleague's inaccuracies: as that his technique wa sloppy, or that his ambition drove him to publis prematurely, or that his political views coloured hi writing, or simply that he is a liar. Therefore w would not expect to read in the *Annals of Botany* passage like the following: "Why has . . . one o our outstanding biologists fallen into error in hi work on mutation of species? . . . Because he ha departed from the principles of Darwinism . . . [an because his] statements have not been subjected t the appropriate comradely criticism without which as our teacher Stalin points out, science canno advance".

This quotation is from the *Botanicheski Zhurna* (Botanical Journal) for December 1952. The write is a *bona fide* botanist and the outstanding biologis he refers to is T. D. Lysenko. British scientifi journals would not be likely to accept such a passag as this, even if it were about Lysenko, and it i important to remember this difference in intellectua climate when we discuss Soviet science. Of cours the Russians publish scores of papers which are a objective and impersonal as the papers in Britis journals. But when they do descend to scandal the do so unambiguously and in public.

This much understanding of the Russian temperament is a prerequisite for reading the recentl translated volume of Lysenko's collected essays o agrobiology. If the British reader approaches it a he would (for example) a volume of essays from Rothamsted he will be nauseated. If he approache it to gain an understanding not of agrobiology bu of Lysenko's career he will be deeply interested. Fo this book contains some of the data necessary for a understanding of the recent history of biology i the U.S.S.R.

It begins with two essays on phasic developmen in plants, published nineteen years ago. Lysenk had stumbled upon the discovery made by Gassne in 1918 that certain plants ripen earlier if subjecte to a cold period, and he spent some years unsuccessfully trying to apply Gassner's technique on a commercial scale. These early essays, though tediou and unconvincing, do make some pretence of recording and interpreting observations. Their obviou intention is not to advance science but to appl science to agriculture. It has to be remembered tha while Lysenko was working on phasic developmen Russia was passing through a terrible crisis. Compulsory collectivization of farms had brought abou a collapse of food production, and millions wer dying of starvation. It is therefore not surprisin that Lysenko's work was tendentious.

There follow in "Agrobiology" half a dozen essays which are little more than harangues to collective farmers. For Lysenko had discovered his flair. He had an uncanny power of persuading peasants to adopt better methods of husbandry and to take a pride in increasing yields; and that was what Russia needed twenty years ago: not so much more science in farming, but simply more common sense in farming. In fulfilling this need Lysenko was notably successful.

His success brought him into conflict with the genuine biologists of Russia for two reasons. First, he sincerely imagined that his successes as a propagandist for better farming were due to his ideas about biology, for he was not content with a pragmatic approach to crop yields: he had to rationalize his methods with the pseudo-philosophical theories of men like Michurin. This he tried to do in a series of violently polemical papers (1937–48), many of which are reproduced in this book. His train of thought was transparently tendentious. "If," he says (p. 230), "I have made a trenchant assault on Mendel's law . . . it is primarily because this law greatly hinders me in my work." Secondly, he sincerely imagined that the failure of other Russian biologists to improve the efficiency of agriculture was due to their preoccupation with fruitless scientific problems and fundamentally unsound theories. The natural reaction of Russian biologists was to ignore Lysenko and his colleagues as troublesome cranks; and this they did successfully until 1948. In that year the State made the decision to give Lysenko official support, and his powerful adversaries were driven into obscurity. It is a mistake to suppose that any reputable Russian scientist was under the impression that Lysenko had made any major discovery. It was a temporary triumph of expediency over truth. As Zhukovsky said at the time, it is important "at this juncture to cherish the prestige" of Lysenko.

"Agrobiology" reproduces in full Lysenko's speech to the Academy of Agricultural Sciences on this melancholy occasion in 1948. There follow a series of essays in which Lysenko's ideas, now free from public criticism, undergo an unrestrained proliferation. He claims to have produced, by manipulating the environment, soft wheats from hard wheats and rye from wheat. He writes less agricultural propaganda and more woolly theory. Apart from advocating the sowing of forest belts on hills, he has little to say which is likely to catch the imagination of the peasant. His articles, notably one (p. 582) published in 1952 for the "Soviet Encyclopedia", become more speculative and more fantastic. Meanwhile, Russian agriculture has again entered upon a crisis, and N. S. Khrushchev, first secretary of the Central Committee of the Party, initiated in 1953 a new set of reforms on collective farms. He heavily criticized the previous policy of the Ministry of Agriculture, and it seems as though he is now willing to charge Lysenko with the very sort of inefficacy with which Lysenko charged his critics in 1948. For on March 29, 1954, the official journal of the Communist Party published the following statement: "The monopolisation of science leads . . . to the cutting off of people who do not think on orthodox lines, and living scientific thought is stifled. This has been shown, for instance, in the All Union Academy of Agricultural Sciences".

Lysenko is still director of this Academy. For a time, and probably due to the critical condition of Soviet agriculture, the Russian Government backed a man who would otherwise have sunk into the scientific obscurity he deserves. His book of essays is a warning against confusing science with practice; and it now seems that it may mark the end of a deplorable incident in the history of scientific thought.

E. ASHBY

THE RISE OF EVOLUTIONARY CONCEPTS

Evolution

Die Geschichte ihrer Probleme und Erkenntnisse. Von Dr. Walter Zimmermann. Pp. ix + 624 + 8 plates. (Freiburg–München: Verlag Karl Alber, 1953.) 32 D. marks.

THE author of this book, Dr. W. Zimmermann, aims at providing a detailed historical survey of the gradual emergence of the concept of evolution in plants and animals and of the progressive realization of the problems it presents. It is divided into three parts. The first, entitled "Doctrines of Descent, without a Scientific Foundation" (Abstammungslehren ohne Abstammungswissenschaften), embraces the ancient period up to the Middle Ages and is largely concerned with a consideration of the attitude of the Greek and Roman philosophers. The second part, "Evolutionary Science without Evolutionary Doctrines" (Abstammungswissenschaften ohne Abstammungslehren), covering the period from the Renaissance to the eighteenth century, is mainly devoted to the role of such pioneers of classification as Caesalpinius, Ray, Linnaeus, etc., but also includes sections on the development of the scientific method (Bacon, Descartes, Spinoza, Leibniz and others) and on the commencing realization of the meaning of fossils. The third part, covering recent times, the "Period of Conscious Evolutionary Science" (Zeit der bewussten Abstammungswissenschaften), deals successively with the pre-Darwinian period (Lamarck, St. Hilaire, Oken, A. Braun), Charles Darwin, and the post-Darwinian period; under the latter heading are included sections dealing with the return to the idealistic point of view (Troll), the rate and causes of evolution (viruses), the biogenetic law, speciation, etc. Such an outline gives but a bare indication of the many aspects of biological science taken into consideration and of the innumerable authorities whose attitude and contribution are evaluated.

The method of treatment is peculiar, since much of the book is occupied by frequently lengthy quotations from various sources, for the most part citations (in German) from the particular authority momentarily under discussion. These are interspersed with often quite brief passages (printed in smaller type) in the author's own words, which serve as commentaries and to link together the matter in successive quotations. This, combined with the division of the subject-matter into numerous sections and subsections, gives a somewhat disjointed character to the whole presentation, and one is inclined to wonder whether a less fully authenticated account would not have resulted in an equally valuable and shorter, but more readable, version. The disadvantage of this dissection makes itself specially felt when the author is tracing the progressive steps in interpretation arrived at by such pioneers as Goethe and A. P. de Candolle, the protagonists of comparative morphology, or, in other domains, of such men as Linnæus and Darwin. There is no doubt that Dr. Zimmermann brings out successfully the gradual development in Darwin's mind of the theory of descent and of the struggle for existence; but could it not have been done more smoothly and just as convincingly in a more connected narrative and in less than twenty-three pages?

On the whole, that dealing with the post-Darwinian period is the least impressive part of the book. Referring, as it must, to almost every aspect of biological science, it is too much crowded with detail to give that broad conception of the forward march during this modern era that would have been specially valuable.

F. E. Fritsch

PROGRESS IN NUCLEAR PHYSICS

Progress in Nuclear Physics

Vol. 2. Editor: O. R. Frisch. (Progress Series.) Pp. viii+295. (London: Pergamon Press, Ltd., 1952.) 63s. net.

The second volume of "Progress in Nuclear Physics" contains an authoritative series of articles on the electron optical properties of magnetic beta-ray spectrometers, by N. F. Verster; nuclear paramagnetic resonance, by R. V. Pound; luminescent materials for scintillation counters, by G. F. J. Garlick; the neutron–proton interaction, by G. L. Squires; nuclear fission, by W. J. Whitehouse; the low-lying excited states of light nuclei, by W. E. Burcham; the nuclear shell model, by B. H. Flowers; and ionization by fast particles, by T. E. Cranshaw. These articles are well written by leading workers in their respective fields.

The review by R. V. Pound describes the magnetic resonance experimental methods for measuring nuclear magnetic moments, the interaction of nuclear moments with the surrounding media and the *g*-values describing the relation between magnetic moments and cylinder momentum. An account is given of the theory of these phenomena.

The scintillation counter has now become one of the most widely used tools of nuclear physics, and Mr. Garlick's review gives an account of their construction and application to the detection of neutrons, cosmic-ray particles, fission fragments, gamma-ray energies and X-rays.

The interaction of the neutron and proton is determined by the all-important nuclear forces. Mr. Squires gives a good account of the contribution of experiments on the scattering of neutrons by protons, protons by protons and the photo-disintegration of the deuteron to the study of this interaction. The experimental data are not yet good enough to come to any firm conclusion about the potentials describing the interaction, and this subject is still being pursued energetically by most laboratories equipped with large cyclotrons.

A vast amount of data has been published since the Second World War on the important subject of nuclear fission, and Mr. Whitehouse's review is very useful and timely in bringing all this together. A brief account of the theory of fission and the experimental techniques is followed by experimental data on fission cross-sections and thresholds; fission yields for particles of different energies; and studies of the energy distribution and properties of fission fragments. An account is also given of the phenomenon of delayed neutron emission, which is a important to reactor design and spontaneous fission rates.

Prof. Burcham gives a brief theoretical description of nuclear spectra in the light elements in terms o the characteristic of nuclear forces. A brief account of the experimental methods used in low-energy nuclear physics is followed by an account of important experimental phenomena such as the energy-levels o mirror nuclei and their interpretation in terms o spin and parity.

Mr. Flowers gives an account of the evidence fo the shell model in terms of spin-orbit forces. Mr Cranshaw describes the theory of loss of energy by ionization of high-energy particles and compares thi with experiments with cosmic-ray particles.

J. D. Cockcroft

SUGAR TECHNOLOGY

Principles of Sugar Technology

Edited by Pieter Honig. Pp. xxii+767. (Amsterdam and New York: Elsevier Publishing Company, Inc. London: Cleaver-Hume Press, Ltd., 1953.) 95s.

Many up-to-date handbooks on sugar technology already exist which might be supposed to cove the needs of the sugar industry, but the one now under review fills a new niche. The editor, Dr. Pieter Honig at present research director to the West Indies Suga Corporation of New York, is rather better known fo his earlier work at the renowned Proefstation voo de Java Suikerindustrie (Java Sugar Experimenta Station), Pasuruan. He has enlisted the assistance o some former colleagues and a number of other leading authorities to write the eighteen chapters of thi volume. The endeavour has been made to link physical and chemical properties of sucrose, reducing sugars and non-sugars with the processes involved in suga manufacture and to assess the degree to which theory underlies actual practice. A second volume is proposed which will be concerned with evaporation crystallization, heat transfer, drying and cooling. The volume is divided into Part 1, which deals more with chemistry and physics, and Part 2, which is concerned with purification of sugar solutions.

Taking these in reverse order, for the latter part i of direct practical importance, it can be said that the three chapters on clarification (chemical technology fundamental reactions and process technology) are uniformly of high standard, and the references in the bibliography at the end of the chapters, as is the case throughout the volume, are extensive and well up to date. Some overlapping occurs, as is usual with a number of authors. The succeeding chapters deal with sulphitation, carbonatation (by Dr. Honig), middle juice carbonatation and ion exchange, and are also to be commended.

Part 1 is open to some criticism; it includes matter which could well have been omitted. For example, in Chapter 2 the tables of physical constants occupy about 42 out of 52 pages and are already available in standard text-books—Spencer-Meade, Brown and Zerban, Circular *C*.440 of the National Bureau of Standards. The physical properties of sucrose are given in bare detail without much discussion of their significance, and the subject of optical rotation is discussed in one page. No reference is made to the recent work on solubility of sucrose by

L. Taylor. Activity coefficients are not defined; those uoted of Downes and Perman (1928) have been otally superseded by the far more accurate work of catchard (1938). The value quoted for the thermal onductivity of packed granulated sugar is undoubtedly too low and approximates more nearly to hat given for raw sugar. The chapter generally lacks o-ordination, being just a compilation of isolated ots and figures. It does serve, however, to emphasize he lack of existence of much correlated data on the hysical properties of sucrose and the need for more oncerted effort in this field. The physical and hemical properties of reducing sugars comprise a ell-written chapter that is marred by inclusion f methods of analysis already mainly found in ell-known works of reference. Other chapters of eal merit have some shortcomings. Some subjects re not discussed at a length commensurate with a olume of this size: for example, kestose, bone harcoal and sugar salt complexes in relation to olasses formation. The described preparation of ure sucrose is out-dated, and later, more suitable ethods are ignored. It is doubtful whether, in fact, ure sucrose can be prepared by recrystallization f beet sugar without some contamination with ffinose.

Chapter 11, with its curious title, is nevertheless a ear and enlightening account of a difficult subject. might have given greater stress to the necessity for lass electrode systems in process control and should ave mentioned the more accurate pH of buffer lutions at elevated temperatures, published by the ational Bureau of Standards, Washington, D.C.; also, more recent book than Dole's is that of L. Kratz, amely, "The Glass Electrode and its Applications".

Chapters on non-nitrogenous acids as well as amino-cids are a useful inclusion, there being no other mprehensive up-to-date collection of data. Chromatographic analysis for the latter has been well covered, ut one is puzzled at the absence of chromatographic amination of sugars and derivatives. One must, wever, be grateful for small mercies, and there is no oubt that Honig's information is by no means small. much useful material has been collected, screened d discussed, together with multitudinous references, at no progressive sugar company can afford to glect this volume; and even the sugar beet industry, hich has not had special attention by Dr. Honig and s colleagues, will find much of interest and importance in its pages.

H. C. S. DE WHALLEY

BRITISH MEDUSAE

he Medusae of the British Isles

nthomedusae, Leptomedusae, Limnomedusae, achymedusae and Narcomedusae. By Frederick ratten Russell. (E. T. Browne Monograph of the arine Biological Association of the United Kingdom.) p. xiii + 530 + 35 plates. (Cambridge: At the niversity Press, 1953.) £6 10*s*. net.

THIS very fine book is not only an outstanding monograph on an animal group and a monument the skill and energy of Mr. F. S. Russell, but is also beautiful thing to have and possess; apart from its rious scientific merits, it has a good deal of entertainment value. This will not have been lost on the thor himself. It is the persons (not to say personalities) of the medusae and polyps which lend themselves to this effect: not only are their figures often elegant, but their postures are frequently lively, comic or grotesque, their tentacles and other parts are waved or brandished with decorative or dramatic insistence, and sometimes assume the semblance of the arms and legs of humanity (see, for example, Figs. 255–6). Thus the volume is full of Russian ballet *décor* and has also its moments of comic relief, as in the clog-dancer of Fig. 211, who is misleadingly described as a "portion of umbrella margin". Here and there the text achieves the same result, where Mr. Russell quotes from an earlier author (as on p. 88, from Forbes, 1848) who uses a descriptive language more vivid than is customary in scientific works of the present day. To return to Mr. Russell's skill and industry, he has illustrated the volume by 319 text figures and 35 plates, the drawings for which were made by himself except where otherwise stated. Among the figures he has included not only many showing the elegancies of living polyps and medusae, but also others giving the appearance of preserved material—very different in its crumpled aspect from that of the live animals, but the more useful for identification in that many collections of planktonic species have to be named from preserved specimens. An interesting and ingenious feature is the introduction of a very effective pictorial key to the British species. A small diagrammatic figure of each is given, and the figures are so arranged as to make preliminary identification practicable not only more quickly but also with less possibility of error than would be the case with a verbal key. The thirty-five plates are reproduced, in the main, from exquisitely delicate coloured drawings by the author. These have been excellently reproduced on pleasing paper, but it is unfortunate that the caption for each plate has been printed in black on the back of its predecessor, so that it shows through the paper slightly and mars the perfection of the preceding plate.

The text begins with an introduction, which is followed by a clear account of the structural features of medusae, including a section on their nematocysts. The next sections deal with life-histories and distribution, the rearing of hydroids and medusae, collection and preservation, with a subject index to the literature. There follow a note on the identification of medusae, and the pictorial key already mentioned. After this begins the main part of the book, which is occupied by descriptions of the British species. These attain the high level to be expected of Mr. Russell, and include notes on distribution, developmental stages, nematocysts, seasonal occurrence and habits, as well as the customary details of structure and history. Finally, there are appendixes and a thirty-page bibliography.

The publication of this book, which has naturally been very expensive to produce, was made possible in the first place by a bequest to the Marine Biological Association from that well-known student of the medusae, Mr. E. T. Browne, who first stimulated Mr. Russell's interest in the group. This initial bequest was supplemented by grants from the Browne Fund of the Royal Society and from the Syndics of the Cambridge University Press. As it is now more than a hundred years since Edward Forbes's "Monograph of the British Naked-eyed Medusae" appeared (in 1848), the publication of a new and much fuller account has been greatly needed. Its achievement in this majestic form redounds greatly to the credit of Mr. Russell, Mr. Browne and the Cambridge University Press.

Onoranze a Leonardo Da Vinci nel Quinto Centenario della Nascita—Comitato Nazionale

Nr. 1: Leonardo Da Vinci: la Vita. Da Titina Strano. Pp. 84+9 plates. Nr. 2: l'Ingegneria Militare di Leonardo. Da Ignazio Calvi. Pp. 40+24 plates. Nr. 3: la Visione Scientifica di Leonardo Da Vinci. Da Carlo Zammattio. Pp. 46. Nr. 4: le Armi di Leonardo Da Vinci. Da Luigi Tursini. Pp. 14+13 plates. Nr. 5: la Botanica nel Pensiero di Leonardo. Da Alessandro Bazardi. Pp. 40+17 plates. Nr. 6: Geografia e Geologia negli Scritti di Leonardo Da Vinci. Da Agostino Gianotti. Pp. 48+7 plates. Nr. 7: Leonardo Da Vinci e la Meccanica Tessile. Da Giovanni Strobino. Pp. 100. Nr. 8: l'Anatomia e la Fisiologia di Leonardo Da Vinci. Da Mario Senaldi. Pp. 64 (24 plates). Nr. 9: Programma e Idealità del Museo Nazionale della Scienza e della Tecnica "Leonardo Da Vinci". Da Guido Ucelli. Pp. 102 (45 plates). Nr. 10: Vinci Leonardo e la sua Famiglia. Da Renzo Cianchi. Pp. 106 (22 plates). Nr. 11: Leonardo Architetto e Urbanista. Da G. U. Arata. Pp. 182+6 plates. Nr. 12: il Pensiero Estetico di Leonardo Da Vinci. Pp. 30. (Milano: Museo Nazionale della Scienza e della Tecnica.)

TO readers of *Nature* the value of eleven monographs on the life and achievements of Leonardo da Vinci is limited by their being written in Italian and the fact that only Nos. 5, 7, 8 and 11 contain bibliographies. All but Nos. 3 and 12 are profusely illustrated, many of the pictures being of the lavishly produced models sponsored by the Italian Government before the Second World War and now re-built to furnish the Italian National Science Museum in Milan (see *Nature*, **172**, 377; 1953). Others among the illustrations will be familiar to those who visited the Royal Academy exhibition in London last year, and it is particularly interesting to note the way in which Leonardo's scientific methods of observation illumine his artistic work on physiology, botany, geology and geography. The range of his interests is astonishing, but there is still doubt as to how far his recordings were of his own original devices and, if so, how far they actually influenced future developments. Pamphlet No. 7 on textile machinery traces devices similar to Leonardo's right down to those in modern machines. Less than justice is done to his work on aeronautics in this series, although it is probably true to say that no evidence exists to show that he had the slightest influence on the future, and some of his ideas were fundamentally unsound. Pamphlet No. 9 is largely an illustrated account of science museums in other countries designed to stimulate Italian interest in the Museum newly raised to Leonardo's honour in Milan.

Physics

By Prof. Noel C. Little. Pp. viii+648. (Boston: D. C. Heath and Company; London: George G. Harrap and Co., Ltd., 1953.) 35*s*.

THIS course represents a decided break from the traditional approach to physics, for it is organized around five fundamental concepts and five types of phenomena. Thus the watertight compartments of heat, light and so on have been broken down, and the subject is presented as a unified whole. Now all will agree that this method has undoubted merits; but the real test of its efficacy is whether it will be more beneficial to students than the more orthodox teaching. Apparently the author and his colleagues have used the course for many years and are satisfied with the results; so far as British schools are co
cerned, one feels that it would probably take a lon
time to establish such a departure from the orthodo
method, whether desirable or not.

For an elementary text tradition has again bee
broken by the use of the M.K.S. system (probably th
most useful) rather than the C.G.S. system of unit
while the British units are confined to the gravitation
system; it will come as a shock to the uninitiate
student that the unit of force is the 'newton', not th
'dyne'.

The course is evidently well planned and excellentl
presented; the mathematics involved is quit
simple, and many typical questions are worked out i
the text. It is sad, however, to find that the ter
'electromotance' supersedes our old friend 'electr
motive force'; in spite of this, though, one suspect
that students and engineers will continue to speak
'e.m.f.'.

Geometrical Optics

By Dr. C. Curry. Pp. viii+173. (London: Edwar
Arnold and Co., 1953.) 21*s*. net.

ALTHOUGH the reviewer is not wholly satisfie
that it is necessary or desirable to devote a separat
book to geometrical optics at this stage of the worl
yet the author, Dr. C. Curry, as a result of his e
perience, is undoubtedly convinced that such a boo
is necessary. His aim is to give a balanced account
the subject suitable for students in the two yea
before a degree examination, at the same time keepi
in view the underlying physical principles and t
ultimate application to optical instruments and the
design.

It must be said at once that Dr. Curry has achiev
his aim very satisfactorily, and he has studiousl
avoided the temptation to lengthen the book
developing certain sections to a more advanced lev
The explanations are very clear and easily followe
and if any section can be singled out it is that on t
aberration of optical systems, which is particular
well done.

Certain departures from the usual nomenclatu
have been made. For example, μ is used exclusive
for relative refractive index, while the time-honour
u and *v* for object and image distances have d
appeared. The so-called new Cartesian sign co
vention is used as being most in line with advanc
optical practice, and in this connexion dare we ho
that one day just one convention will be adopted f
universal use?

River Purification

A Legal and Scientific Review of the Last 100 Yea
By F. T. K. Pentelow. (Being the Buckland Lectur
for 1952.) Pp. viii+63. (London: Edward Arno
and Co., Ltd., 1953.) 5*s*. net.

THIS small volume contains the text of the thr
Buckland Lectures for 1952, which were deliver
by F. T. K. Pentelow, chief inspector of salmon a
freshwater fisheries in the Fisheries Department
the Ministry of Agriculture and Fisheries. The fi
lecture—on the development of the law affecti
pollution of rivers—is an admirable summary, w
a useful bibliography of Acts of Parliament. T
remaining two lectures deal with the effect of poll
tion on streams and with methods of treating was
waters; they are necessarily brief, are addres
primarily to river authorities concerned with fre
water fisheries, and give a sound account of t
elements of the subject. B. A. S.

THE REOPENING OF PULKOVO OBSERVATORY

IN 1835, F. G. W. Struve was commanded by the Emperor Nicholas to superintend the erection, /ithout regard to expense, of an astronomical bservatory at Pulkovo on the summit of the low ills some eleven miles south of St. Petersburg. broad highway already led due south (actually t is a degree away from the true meridian) from he Admiralty spire in the centre of the city, and he site chosen was on the line of this road. The bservatory, which "was acknowledged to surpass ll others of its kind in splendour, efficiency and ompleteness", was opened in August 1839 with truve as director. The renown of the Observatory nainly rests on the incomparable series of meridian bservations, made with great skill and care, without nterruption and with the same instruments—a transit elescope for right ascensions and a vertical circle for eclinations. The value of these observations to ositional astronomy is very great. But its fame also ests on a broader basis, especially in later years.

Pulkovo Observatory maintained its standing hrough the Revolution of 1917, and its traditional ork on fundamental astronomy was continued on a igh level until the Second World War. During the iege of Leningrad in 1942, the Observatory was in the direct line of fire, and its site, commanding the plane of the city and clearly of military importance, was occupied by the enemy. The buildings were completely destroyed, but the smaller instruments, the optical parts of the larger instruments and the more valuable records and books (including the Kepler manuscripts) were moved to safety; among other losses the mounting of the 30-in. refractor was demolished. At the end of the War the Observatory lay in ruins.

The rebuilt and re-equipped Central Observatory of the Academy of Sciences of the U.S.S.R. at Pulkovo (Fig. 1) was formally inaugurated on May 20–22 in the presence of some five hundred astronomers and scientists, including representatives from most countries from China to the United States. The inaugural address was given on the evening of May 20 in the hall of the Academy of Sciences in Leningrad by Academician Bardin, acting on behalf of the president of the Academy, who was ill. On the following day he declared the Observatory open by formally cutting the tape at the entrance to the main building; this ceremony was followed by the presentation of congratulatory addresses and a general inspection of the Observatory. Many of the addresses were in elaborate

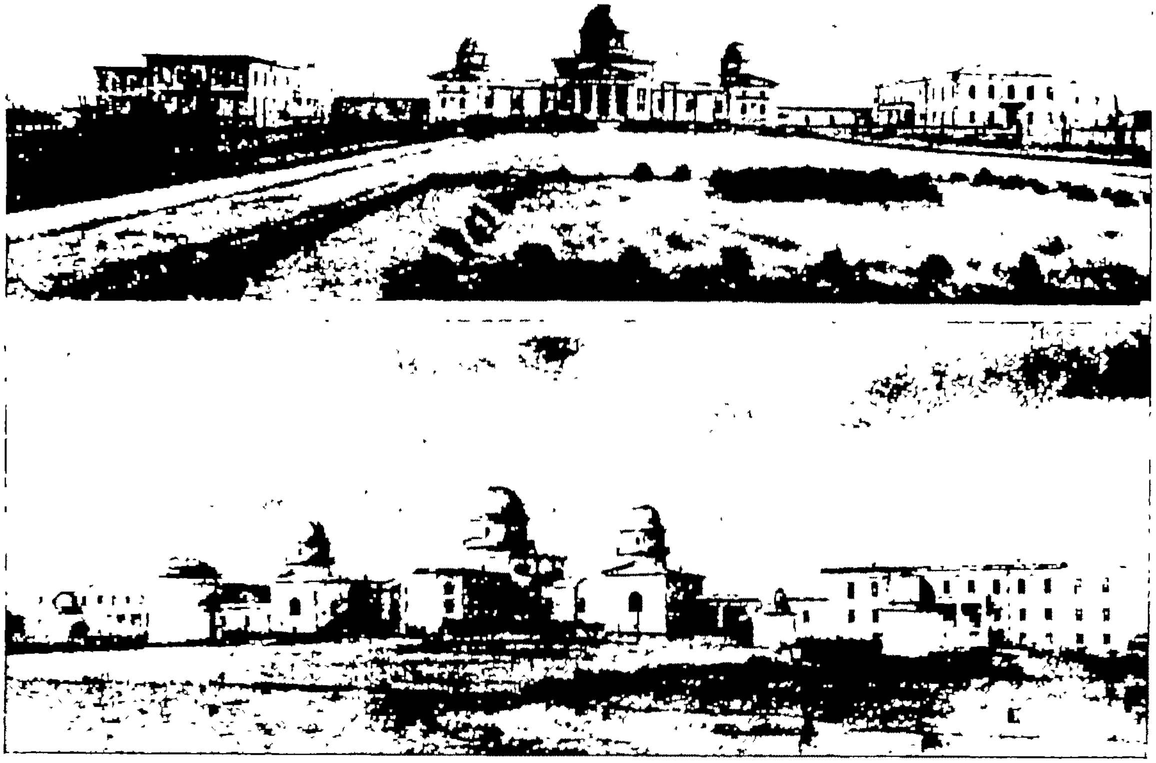

Fig 1. General views of Pulkovo Observatory: above, from the north; below, from the south

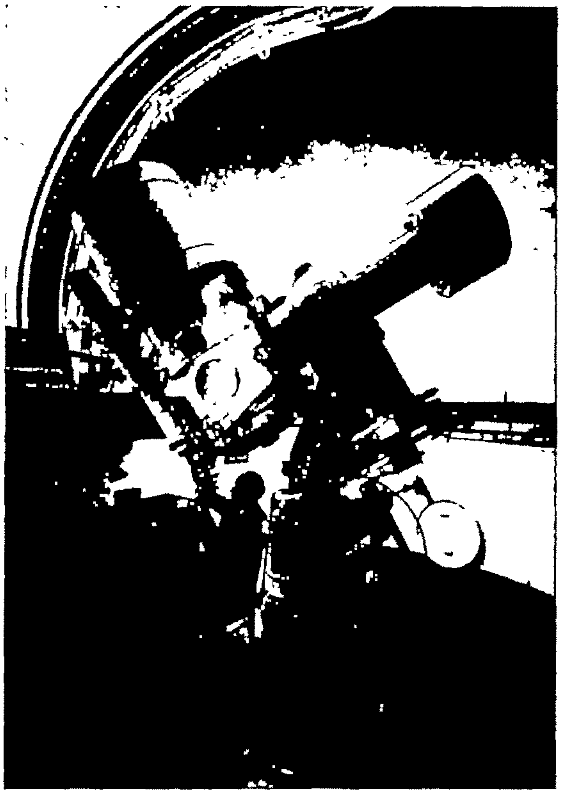

Fig. 2. The Maksutov meniscus telescope. The ultra-violet spectrograph is designed for attachment at the end of the polar axis

bindings, and the Chinese delegation presented a magnificent red and gold silk banner. The following day was devoted to a series of papers describing the work of the Observatory by the astronomers in charge of the different departments.

The main building of the Observatory has been rebuilt exactly as it was (even to the date 1839 over the main entrance), thus preserving the well-known silhouette of the three domes (actually they were turrets in the old building), which is such a fine landmark as seen from Leningrad. But two large wings have been added, containing offices, laboratories, residences for the director and senior staff, and a magnificent conference room; seating more than 250 in tip-up chairs, panelled in marble, with fine curtains, with cinema projectors and screens, it must surely be the finest in any observatory.

In the central building are the two famous old meridian instruments of 1839, restored and in working condition, side by side with new instruments. One of these is a mirror transit in which star passages are observed through fixed north–south telescopes by reflexion from a steel mirror, which is the only moving part; the results are encouraging. At present the three domes contain only minor instruments or are awaiting new ones.

However, there are some twenty other groups of buildings and domes, a few still in course of erection The larger buildings comprise a hotel which can accommodate fifty students or guests, living quarters for the staff, and a hostel for junior staff; there is even a kindergarten. Some of the domes and pavilions contain the pre-war instruments, such as the 7-in meridian circle (1914), the astrographs and the vertical telescope; but there are four or five entirely new instruments. Perhaps the most interesting is the 500-mm. Maksutov meniscus telescope (Fig. 2) designed for use with a spectroscope in the ultra violet; it appears to have been built entirely in the Soviet Union.

Another remarkable instrument is a polar telescope designed by the director, Prof. A. A. Mikhailov. I must be one of the few telescopes with which observations are made through a glass window; this allows the whole building to be thermally insulated The instrument is operated by remote control, so that the observer need not enter the building during the night's observation. Careful measurements show that, by excluding the body-heat of the observer internal refractions in the telescope tube are substantially reduced; there is a still further reduction when the building is left sealed for several days. Fo simplicity the plate is fixed, and exposures are made by means of a rotating shutter in front of the objec glass; the position of the pole is therefore determined on each plate from a series of short arcs for each o four or five stars. The interesting feature is that th Loomis telescope at Yale, adapted for precisely th same programmes, uses an entirely different design the long tube is open to the outside air, and the plate rotates to counteract the earth's rotation. The eventual comparison of results from the two instruments will indicate which choice of desirable an undesirable factors is the better.

A rather revolutionary instrument is an interferometer (looking like a range-finder) designed by Academician Linnik for observing, with extreme accuracy, the horizontal component of the separation of double-stars (see Fig. 3). By observing at differen

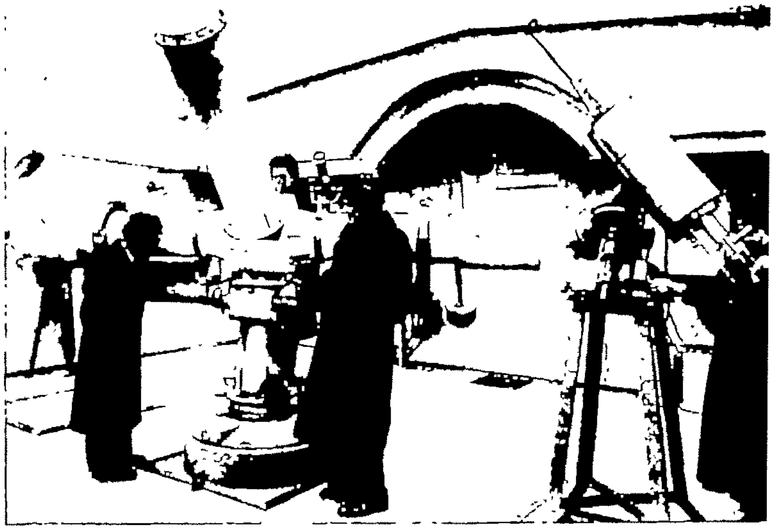

Fig. 3. The Linnik interferometer for measuring the separation of double stars. Academician Linnik is in the centre of the picture

our angles, the actual separation and position angles can thus be calculated.

The horizontal solar telescope with its several different spectrographs is apparently giving good results, due mainly (according to Prof. Krat) to the excellent definition which is a feature of Pulkovo during the early summer. Some of the direct photographs, on a scale of 56 cm. for the sun's diameter, show remarkable surface detail and solar granulation, with individual granules about 0·4″ in diameter.

It has been decided not to remount the 30-in. object glass, and a new 32-in. objective has been constructed in Leningrad; a mounting is being designed.

It is impossible to assess the merit of an observatory, especially one of which the main work is astrometric, from a superficial tour of inspection. To British ideas some of the building work (largely done by women) is rather poor and some of the equipment rather naive. But the general impression is that Pulkovo is a fine observatory, with a wide range of instruments, and, above all, with a first-class staff under the direction of an astronomer who commands world-wide respect; there seems every prospect that Pulkovo will attain the eminence in the future that it has so justly been accorded in the past.

This account would not be complete without recording that the rebuilding of Pulkovo is but one of the many evidences of great astronomical activity in the Soviet Union. For example, the Sternberg Institute and Observatory of the University of Moscow are being rebuilt on a grand scale on the Lenin Hills, in the shadow (as it were) of the towering new university buildings; but the main observing station will be some twenty-five miles south of Moscow. The opening ceremonies were followed by two conferences—one on astrometry and the other on variable stars—both of which were the eleventh of a regular series organized by the Astronomical Council of the Academy of Sciences. The numbers present at these conferences and the reports from the different observatories confirmed the increasing interest in astronomy. Other evidence is the great number of text-books, at all levels, being produced: some are extremely good.

There is not, and perhaps has never been, any doubt as to the genuine desire of the Soviet astronomers themselves to co-operate with those of other countries; the personal contacts at Pulkovo reaffirmed this, and it is greatly to be hoped that freer intercourse will be possible.

The astronomers from the Western countries (two American, one Canadian, two British, two French, one Belgian, two Dutch, one Norwegian, one Swedish and one Italian) are most grateful to the Soviet Academy of Sciences for making possible this meeting with their colleagues in the U.S.S.R., and for its most generous and comprehensive hospitality both in Leningrad and later in Moscow.

D. H. SADLER

A GREAT HAUL OF AMBERGRIS

By ROBERT CLARKE

National Institute of Oceanography, Wormley, Surrey

DURING the last Antarctic whaling season a boulder of ambergris weighing 926 lb. was found in the large intestine of a bull sperm whale (Fig. 1). The whale, which was 49 ft. long, was being worked up on board the floating factory *Southern Harvester* on December 21, 1953, in 58° 23′ S., 14° 13′ W.

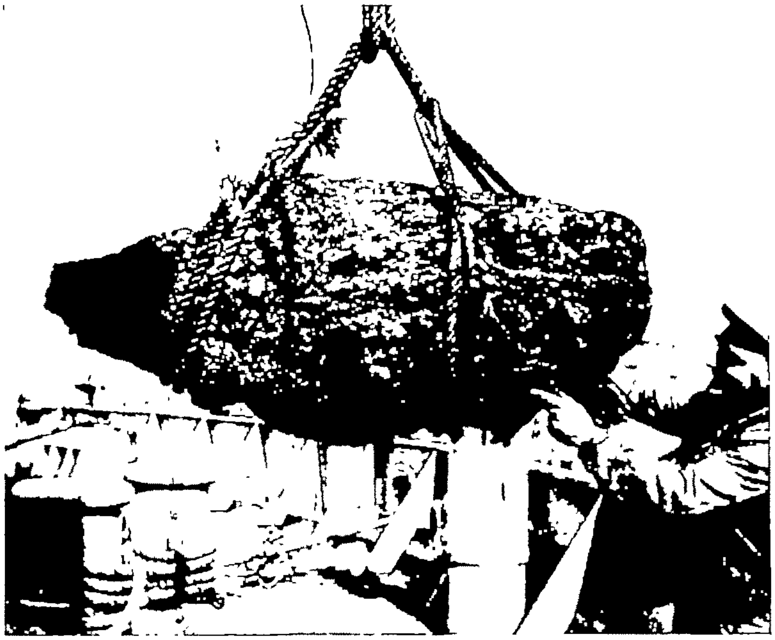

Fig. 1. Ambergris weighing 926 lb taken from a sperm whale in the Antarctic on December 21, 1953. (*Photo by courtesy of Messrs. Chr Salvesen and Co*)

Although this boulder is no doubt the largest single mass to be properly examined and authenticated, the figure of 926 lb. is actually exceeded by four others in the literature. However, when these figures are examined, at least three of them do not necessarily refer to a single mass from one whale: the largest figure is to be found in *The Times* of December 15, 1947, which printed a report that the Brazilian steamer *Araxa* chanced upon ten tons of ambergris at sea. This was described as a "gray, odoriferous mass"; but it is not conceivable that such a quantity could have come from one whale, and, if the substance was ambergris and its weight not exaggerated, then it could only have been an extraordinary drift of numerous lumps of flotsam ambergris close together. The other three figures are more reasonable when judged by the present haul. 983 lb. of ambergris were entered in the manifest of the whaling bark *Splendid* of Dunedin, New Zealand, in 1883 [1]; but this was a production figure at the end of a whaling voyage and so may have included ambergris from more than one whale. The Portuguese Fisheries Statistics record 928 lb. (422 kgm.) from San Miguel, Azores, in 1944; but this may have comprised a lump of 708 lb. (322 kgm.) plus one or more smaller finds[2]. The only figure, in fact, which specifically refers to a single mass of ambergris greater than the present haul is one of 982 lb. and describes ambergris which once belonged to the Dutch East India Company[3]. Even here van Beneden and Gervais (p. 304) thought they should record this gigantic mass cautiously and therefore suggested that it might be an agglomerate of several pieces stuck together while in some plastic state fresh from the sperm whales. But the present haul weighs only 56 lb. less, so it seems reasonable to admit this 982 lb. mass from the Dutch East India Company to be the largest known mass of ambergris, with the present haul of 926 lb. taking second place. A lump practically as large, weighing 924 lb. (420 kgm.), is recorded from a sperm whale taken on the Australian coast many years ago[4].

The present mass is 65 in. long and its greatest diameter measures 30 in. In the same factory ship, on November 21, 1947, and in 55° 59′ S., 03° 32′ E., I had the good fortune to find and examine a smaller, but still notable, boulder of ambergris which weighed 340 lb. and measured 26 in. across its greatest diameter[5]. Presumably because of their size, very large lumps of ambergris have been said to be invariably found in the stomach of the whale and not in the intestine[6]. But both masses from the *Southern Harvester* were found in the large intestine, which is the organ where I have in the Azores once or twice found small 'parcels' of ambergris, and where, indeed, have been made all those ambergris finds inside the whale for which reliable accounts exist. Now, without measurements to hand, I recollect the adult sperm whale's large intestine as measuring 6 or 7 in. in collapsed diameter. These ambergris weights and measurements, combined with a glance at Fig. 1, therefore show how astonishing it is that a sperm whale is able to carry, within an intestine which can distend fourfold without rupturing, such a vast weight in its body and can still maintain its digestive processes and not appear obviously sick. For both these whales had food in their stomachs and both were in good condition, although for nearly two centuries it has been customary to say that ambergris comes only from sick, lean whales.

The nature and origin of this intriguing substance are problems which deserve to be re-examined. Modern text-books either describe ambergris as a "biliary concretion" or as a substance arising from irritation of the intestine by the horny beaks of the squid which form the chief food of the sperm whale. Schwediawer[7], however, in 1783, wrote: "We may therefore define Ambergris to be the praeternaturally hardened dung or faeces of the Physeter Macrocephalus, mixed with some indigestible relics of its food". By the examination of these two great masses, and of smaller finds, and by descriptions in the literature, I am led to a similar conclusion. Local increase in water absorption by the large intestine, and the chemical transformations enacted by the resident intestinal bacteria, probably each play their part in the formation of ambergris from faeces impacted around some matrix of indigestible material.

It may be possible to produce ambergris in the laboratory by incubating sperm whale faeces in suitable conditions. The matter is of some commercial importance because ambergris is still a valuable commodity without equal as a fixative in perfumes.

An account of ambergris is projected which, besides describing its history and mythology, its composition, properties and uses, will attempt to explain its origin in the whale in the way briefly indicated here.

I would like to thank Messrs. Chr. Salvesen and Co., owners of the *Southern Harvester*, for their facilities in 1947–48 and in May of this year when I examined the new find; I am grateful to Mr. Desmond King and to Commander Percy Ashe, R.N., respectively chief chemist and whaling inspector of the vessel, for their kind assistance.

SOME CHEMICAL ASPECTS OF ABNORMAL GROWTH*

By Prof. F. BERGEL
Chester Beatty Research Institute, Institute of Cancer Research, Royal Cancer Hospital, London, S.W.3

SOME chemical aspects of normal growth and development were considered by me last year[1]; very little has since been published to add to our limited knowledge in these fields. This is particularly so with respect to the fundamental problem of reduplication of specific functional and structural macromolecules in the cell[2–5]. In this article I shall deal with chemical-biological problems connected with abnormalities of growth and development of a non-malignant character. One has to assume that during the normal processes a most admirable harmony prevails between the stimuli and inhibitors which act at the right moment on the correct cell or tissue receptors. When this harmony is upset, disorders of growth, or during embryonic stages, disturbances of differentiation and morphogenesis, or both, are produced. The expert can recognize them on a cellular, tissue, organ or whole-body level[6–8].

Disorders of Growth

One distinguishes between hypertrophic and hyperplastic states, on one side, and atrophic and hypoplastic on the other. The latter, which amount to diminution in size of an organ or muscle, are due to shrinkage of tissue or reduction in the number of cells respectively and are usually connected with lowered metabolism. Whether this is caused by old age, malnutrition, starvation, disuse or traumatic damage, the normal turnover of metabolites, that is, the synthetic and catabolic processes of the cells, has decreased. Often, vitamin deficiencies contribute to these reductions, resulting in irregularities of enzyme functions. In some cases they are the sole primary cause, as in the muscular dystrophy of rodents through vitamin E deficiency[9]. Hormonal deficiencies, apart from their overall effect, often produce glandular atrophies and hypoplasias: for example, pituitary dysfunction causes, under certain conditions, thyroid and adrenal hypoplasia[10]. Hypoplasia seems to be present also in the bone marrow of some anaemic patients; but pernicious anaemia and reticuloses often show the opposite, namely, hyperplasia.

This hyperplastic state, which is due to an increase in the number of cells above the normal, occurs requently together with hypertrophy, meaning an nlargement of cells, fibres and, with them, of tissues nd organs. At other times, hypertrophy can be bserved on its own, and might be of a physiological, daptive or compensatory nature. While the pregnant uterus with its fibres enlarged ten times their ngth and four times their width represents a hysiological case, the over-exercised motor muscle n the 'strong man' illustrates that of the adaptive mechanism. A typical example of the compensatory ype can occur in double organs, such as the kidney, where, after removal or atrophy of one half, the emaining half is enlarged. This hypertrophic reaction can surprisingly be enhanced in rats, ccording to Gross and Meier[11], by dosing them with ortisone, which usually suppresses protein synthesis. Thus the biochemistry of hypertrophy and also of hyperplasia deserves further attention, particularly s the results may throw some light on that of malignancy.

---

* Synopsis of two lectures given at the Pharmacology Department, University College, London, on February 4 and 9, 1954.

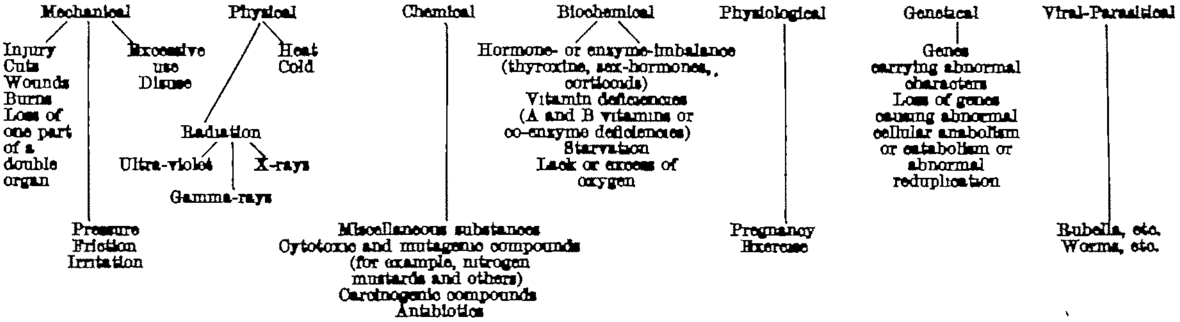
Before giving more details of abnormal growth, it may be useful to mention differences between the wo forms of excessive growth which include benign tumours and neoplasia of a malignant character. Although the dividing line between benign abnormality and cancer is not always well defined, it can be said that the main differences are these: truly neoplastic tissue is capable of invading normal tissue, it can cause secondary tumours or metastases, is, under experimental conditions, transplantable within he same species, and shows histological and cytoogical irregularities. While it has been found that essation of action of a stimulus or an appropriate inhibitor which may be one of the primary causative agents in the formation of hyperplastic and neoplastic issue will lead to regression or even arrest of the former, malignant neoplasia shows irreversibility or autonomy. At present the most favoured hypothesis as to the cause of neoplasia on a cellular level is that he cell has undergone a change in its somatic-genetical characters and is gradually losing some of its differentiation characteristics. It has acquired, instead, the growth potency of immature embryonic cells without obeying, as they do, the controlling nfluence of the tissue to which they belong or the organism as a whole. However, biological and, particularly, chemical differences between cancer cells, abnormal and normal cells are more of a quantitative than a qualitative nature.

Numerous examples of such quantitative differences in biochemical behaviour have been quoted in the iterature[12]. On the whole, benign hypertrophic and hyperplastic abnormalities yield, in several respects, results occupying a medium position between those obtained with normal and malignant material. This s the case[13], for example, with respect to the oxygen consumption in the absence and presence of succinic acid in conformity with Warburg's original observation of the preponderance of aerobic glycolysis in tumours. It also becomes manifest when comparing the amounts of trace elements present in normal, hyperplastic and neoplastic tissue[14,15]. As this problem of trace metals in tissues, particularly in view of the part played by some of them as enzyme activators, deserves further investigations with improved analytical methods, a start has been made by workers at the Chester Beatty Research Institute and the Royal School of Mines, London[16], to assay a great number of normal and abnormal tissues, including malignant tumours, as to their contents of major and minor metallic constituents.

In the following, a few examples of hypertrophic and hyperplastic conditions are given, together with relevant experimental findings. Not only the tissues of animals and man may show abnormalities of growth, but also plants are subject to such disorders, called 'galls'. Crown gall, for example[17], is caused by a microbe, *Agrobacterium tumefaciens*, and simultaneous injury. This plant tumour shows some similarities with mammalian neoplasms as it is autonomous and transplantable. There exist other galls[18] of a more benign nature which are produced by certain insects when laying their eggs, by insertion into the plant tissue. The character of these galls is determined by the insect species or by the active chemicals released by it, and not by the plant species. It would be very desirable if the substances causing these abnormalities could be isolated. This is the more important as growth regulators, such as indole acetic acid, when injected into plant tissue, can initiate the formation of galls having greater likeness to those produced by insects than to the malignant crown galls. But the situation is somewhat complicated by the fact that plant tissue, invaded by *Agrobacterium*, shows an increase in indole acetic acid content, and that early crown gall transfers[19] are suppressed by maleic hydrazide, a typical indole acetic acid antagonist. Although much can be learned from growth abnormalities in plants, their production by insects and relatively simple growth regulators should introduce an element of caution into comparing them directly with animal or human disorders. On the other hand, it has been established that the activity of protozoa, bacteria and viruses can lead to abnormalities in avian or mammalian tissues. This can be demonstrated in human skin[20] where, apart from verruca or warts, caused by mechanical trauma, possibly followed by an infection, a disease called molluscum contagiosum occurs. There the agent producing proliferation is a virus, while, in keratoderma blenorrhagica, cocci are responsible for the histological changes. We are only slowly learning what these changes mean in chemical terms, with regard to enzymes, proteins, nucleic acids and other cellular constituents.

It is not unlikely that continued investigations will reveal that other agents, whether physical or chemical, causing disturbances of growth, produce similar metabolic irregularities in the end. In the case of injury, taking again the skin as an example, where a most admirably ordered process of regeneration takes place normally, the repairing tendency, particularly of the connective tissue, may become exaggerated and collagen synthesis too abundant. The consequence is cheloid formation or scarring. Looking at other parts of the body, such as glands and organs, one finds that hypertrophic or hyperplastic changes can develop due to a number of different factors. In those parts of the body which are under the control of hormones, often an imbalance of hormonal production is at the back of pathological changes. One gland studied in great detail is the thyroid[21], where hyper- or hypo-activity of the iodo-thyronines may lead to various forms of goitre accompanied by other symptoms of ill-health. The sex organs are particularly sensitive to changes in the quantities of steroid derivatives such as œstrogens, androgens and progesterone, either as growth stimulants or inhibitors, and in this connexion it is interesting to note that Boyland *et al.*[22] have succeeded in producing hyperplasia in testes of young cockerels by application of certain sulpha drugs, such as sulpha mezathine.

Fig. 1. POSSIBLE PRIMARY CAUSATIVE AGENTS AND FACTORS OF ABNORMAL GROWTH AND DEVELOPMENT



Mechanical
Injury
Cuts
Wounds
Burns
Loss of one part of a double organ
Excessive use
Disuse
Pressure
Friction
Irritation
Physical
Heat
Cold
Radiation
Ultra-violet
X-rays
Gamma-rays
Chemical
Miscellaneous substances
Cytotoxic and mutagenic compounds (for example, nitrogen mustards and others)
Carcinogenic compounds
Antibiotics
Biochemical
Hormone- or enzyme-imbalance (thyroxine, sex-hormones, corticoids)
Vitamin deficiencies (A and B vitamins or co-enzyme deficiencies)
Starvation
Lack or excess of oxygen
Physiological
Pregnancy
Exercise
Genetical
Genes carrying abnormal characters
Loss of genes causing abnormal cellular anabolism or catabolism or abnormal reduplication
Viral-Parasitical
Rubella, etc.
Worms, etc.

The effect observed is independent of the bacteriostatic action of the drugs and is not neutralized by the administration of *p*-aminobenzoic acid or folic acid. Green[21], when injecting an androgen into goldfish, has succeeded in producing epithelial hypertrophies, which the males develop normally during the breeding season on gill plates and pectoral fins. With regard to œstrogens, numerous results have been reported on their growth-stimulating effects[22]. While the original observation of hyperplasia of the whole uterus in rodents following prolonged application of such œstrogens was extended by Horning[22] in the rabbit to the formation of discrete tumours, so-called fibromyomata or fibroids, others, and particularly Lipschutz[23], found that under certain conditions female guinea pigs developed such fibroids, not only of the uterus but also of other organs in the abdominal cavity. Such proliferations, however, were reversible and regressed when the application of the œstrogenic substance was stopped; only in exceptional cases did they show irreversible and, thus, malignant properties. Lipschutz, who established that fibromatogenic activity went parallel with the œstrogenic activity of the drugs used, discovered that other steroids, among them progesterone, androgens and deoxycorticosterone, showed fibroid-preventing effects. Strangely enough, cortisone and related compounds turned out to be inactive. All these experimental results are, of course, of great value in human medicine, which has known the spontaneous formation of fibroids and non-malignant tumours for a long time. It seems that, in woman, sex hormone imbalance is also one of the causative factors.

There are in man a number of other organs which are prone to benign proliferative abnormalities, such as the intestines, the kidneys, the reticulo-endothelial system and others. Interesting results have been obtained by Haddow[24] when injecting rodents with certain analogues belonging to the group of pteridines and purines. Among others, the naturally occurring xanthopterin produced hypertrophy of the kidneys in experimental animals by stimulation of cell division in the epithelium of the tubules. These effects are reversible and may be due to interference with activity of enzymes. A number of substances synthesized by Timmis, Ross *et al.*[25] were therefore tested as to their inhibition on one of the enzymes of nucleic acid catabolism—namely, xanthine oxidase—and for their kidney effects. Although in some cases the *in vivo* and *in vitro* activities, or their absence in these two effects, showed good correlation, in others no such parallelism could be noted[25]. It is therefore unlikely that the hypertrophy is solely due to the inhibition of xanthine oxidase, and work is continuing on other enzymes and metabolic events.

Disorders of Development and Morphogenesis

Just as disorders of growth are the consequenc of irregularities of cellular and tissue metabolism, s disturbances during the embryonic period and thereafter are followed by disorders of development an morphogenesis and result in malformation.

Last year[1] an attempt was made to summarize th state of the biochemistry of morphogenesis as reviewe by Needham[26], Brachet[27] and others. Space does no permit me to go into details as given during m recent lectures[28], and it must suffice to mention recen findings by Toivonen[29] which seem to confirm th existence of specific evocators, released by organize regions and inducing in competent areas of the ovu the development of neural and mesodermal tissues. Brachet[30] has emphasized the close link betwee morphogenesis and the gradients of ribonucleic acid in the fertilized egg. He has also mentioned the disturbing effects of chemicals or oxygen deficiency leading in extreme cases to the arrest of development It becomes more and more apparent that any disturbance of the interplay between organizers an the growth process of the embryo will produc developmental disasters. Such disasters can be, o course, genetically conditioned in that the sperm o the egg have carried abnormal genes. As genes ar known to control enzyme synthesis and the vita reduplication of other cellular constituents, it i obvious that abnormal ones will bring about abnormalities in the embryo. On the other hand, outsid factors, whether they are of physico-chemical o parasitical nature, can cause maldevelopment an malformations. Thus, temperature, radiation, toxi concentration of ions or drugs do more harm durin this sensitive period than at any other time. Girou and collaborators[31] have demonstrated that sligh vitamin deficiencies in the rat, which do not touc the mother animal, will produce most serious malformations in the embryo. While he has studie mainly the effects of shortcomings in the B group o vitamins, other vitamin deficiencies, such as A, etc., have been shown to cause maldevelopment even i the pig. A temporary lack of oxygen during incubation of chick eggs, as demonstrated by Büchner e *al.*[32], will lead to malformations of the heart and th major blood vessels, and cortisone, again in the same animal, according to Chester Stock *et al.*[33], suppresse overall growth. Forbus[8] describes, with regard t human pathology, a great number of abnormalitie in whole organs and limbs, which are reminiscen of those produced experimentally as already mentioned. Apart from a complete breakdown o development which leads to production of amorphou embryonic masses, abnormal twinning may give ris o the formation of monsters and teratomas which n the old days have often formed the subject of airy tales and sagas. Giants and dwarfs are also lescribed, or men with supernumerary or missing imbs, eyes and features. Each of these abnormalities s known to modern embryologists or pathologists s hyper- and hypo-genesis, including those nalformations which, due to endocrine deficiencies, nay turn up as late as in childhood or even later still.

All these disturbances of development have many eatures in common, in some yet incompletely recognized way, with disorders of cellular and tissue growth. Summarizing, it is permissible to speculate hat they all derive basically from irregularities of cellular constitution or metabolism in the form of ailures of normal protein or nucleic acid synthesis and thus enzyme or hormonal imbalance. Considering the possible primary causative agents and factors of abnormal growth and development, one can arrive entatively at a diagram as shown in Fig. 1. In conclusion, one may state with Ingersoll : "In nature here are neither rewards nor punishment, only consequences".

OBITUARY

Prof. T. G. Hill

THOMAS GEORGE HILL, emeritus professor of plant physiology in the University of London, died on June 25 at his home at Hambledon near Godalming in his seventy-ninth year.

Born in London in 1876 he was educated at St. Olave's Grammar School and the Royal College of Science. He was for a time demonstrator in biology at St. Thomas's Hospital and in later years seemed very proud of his early connexion with this Hospital. After holding various lectureships in the University of London he became, in 1912, reader in vegetable physiology at University College, London, and following F. W. Oliver's retirement in 1929, professor of plant physiology and head of the Department of Botany.

His Department was a very happy one ; all students who entered it, and not only those reading special botany, were made to feel they were members of the Department. To undergraduates entering his Department for the first time 'T.G.' gave the appearance of being fierce and rather awe-inspiring. But as one got to know him better one realized that beneath the gruffness of manner he was a kindly gentleman—more than a little sentimental and not without his prejudices.

It is perhaps worth recording the advice 'T.G.' gave to one assistant lecturer he had appointed. "Prepare all your lectures carefully and thoroughly and always tear up your notes after you have given your lecture." His own lectures were models for any beginner to follow. He used few notes and spoke lucidly and fluently. It was a delight to listen to him build up an argument in a way that made the topic seem both logical and easy. The important points would be brought out by some telling phrase or striking analogy (generally far removed from botany). The result was a course of lectures which fifteen years later still remain vividly in the mind.

T. G. Hill's botanical researches fall into two parts. The first part of his researches was devoted to plant anatomy, and he never lost his interest in this field. His most important anatomical work was perhaps the series of papers published with Ethel de Fraine on seedling structure. The work was at first based on a phylogenetic point of view ; but the final paper in the series (still worth reading) in the *Annals of Botany*, 1913, marked the end of an era. The point of view had changed ; the varying structure of seedlings was not to be interpreted phylogenetically but physiologically ; the investigation had become a study in causal anatomy.

The second part of Hill's researches concerned plant chemistry and metabolism and was carried out largely in collaboration with Dr. Paul Haas (then reader in plant chemistry). They were the first botanists in Great Britain to study an oxidation-reduction system, hermidin, from *Mercurialis perennis*. Later appeared a long series of biochemical papers on the metabolism of marine algae. This was pioneer work in a field the importance of which is only now being generally realized.

In 1913, with Dr. Haas, he wrote "The Chemistry of Plant Products", which became a standard work. It is now, of course, somewhat out of date, but Vol. 2 on "Metabolic Processes" can still be read by students with profit, for its dynamic method of approach and presentation. It must remain a matter of regret that the authors did not see fit to revise this work.

As a member of F. W. Oliver's Department, Hill paid many visits to Blakeney Point, Norfolk. One result of this was his paper (with J. H. Hanley) on "The Structure and Water Content of Shingle Beaches", as well as studies on the osmotic pressures of salt-marsh plants.

In 1915 he published "The Essentials of Illustration". This book was not without its effect upon the standard of illustrations in biological journals; but it never became well known and indeed was not noticed in any botanical journal. In later years 'T.G.' suggested that this might have been because some of the material he used for his illustrations was rather frivolous.

From 1911 T. G. Hill served in the University of London Officers' Training Corps. He was adjutant during the First World War, became major in 1917 and resigned his commission in 1919. During the Second World War he took his department to Bangor, where he entered into the teaching and demonstratin with a zest which must at times have been a trial t his hosts. He was nearly seventy when he retirec

'T.G.'s retirement was spent at his home i Hambledon. He was well known and liked in th village and will be remembered for his kindnes especially to the children. He was a keen supporte (and critic) of the Hambledon Cricket Club and serve as president. He was also at one time president of th now defunct Hambledon Garden Club.

During the post-war years he became a governo of Guildford Technical College, in which he took great interest. Characteristically, he resigned a fe months ago, when he was no longer able to get to th governors' meetings.

At University College 'T.G.' was well known an well liked in the smoking room. He will be remembered with respect and affection by many studen and colleagues.

D. J. B. White

NEWS and VIEWS

Biochemistry at Oxford :

Sir Rudolph Peters, F.R.S.

Sir Rudolph Peters retires at the end of the present academic year from the Whitley professorship of biochemistry in the University of Oxford, a post he has held since 1923. Peters studied as an undergraduate at Caius College, Cambridge, of which he became Drosier Fellow and Tutor. He took his B.A. in 1911 and graduated M.B., B.Chir. in 1915. After research and lecturing in biochemistry at Cambridge he joined the R.A.M.C., being awarded the M.C. with bar during the First World War. In 1919 he gained the M.D. degree of Cambridge. At Oxford, from 1923 onwards, he built up a flourishing school of dynamic biochemistry and found the first clue to the mode of action of thiamine from a study of its *in vitro* effects on metabolic processes. In the Second World War the development of British Anti-Lewisite, a substance of usefulness in a wide range of metallic poisonings, was a delightful example of the practical outcome of theoretical considerations. More recently, Peters has investigated the toxic action of fluoroacetic acid and has elegantly demonstrated how the incorporation of this substance into constituents of the tricarboxylic acid cycle leads to toxic action.

Peters has earned many distinctions. He was elected a Fellow of the Royal Society in 1935, receiving a Royal Medal in 1949 and delivering the Croonian Lecture in 1951. Many honorary degrees and many distinguished lectureships have been held by him, including the Dunham Lectureship at Harvard University. During 1946–50 he was a member of the Medical Research Council. Caius College elected him an Honorary Fellow in 1951. Fortunately, he will not be lost to the world of science on his retirement from Oxford, since he takes up a post with the Agricultural Research Council at the Institute of Animal Physiology, Babraham.

Prof. H. A. Krebs, F.R.S.

Prof. H. A. Krebs has been appointed to succeed Sir Rudolph Peters as Whitley professor of biochemistry at Oxford. He has been professor of biochemistry in the University of Sheffield since 1945, and the award to him, jointly with Dr. F. Lipmann, of the Nobel Prize for Medicine for 1953, was noted in these columns last year (*Nature*, 172, 837; 195 Prof. Krebs was educated at the Universities Göttingen, Freiburg i. B., Munich and Berlin, bei assistant in the Department of Prof. Otto Warbu at Berlin-Dahlem during 1926–30. He went t Cambridge as a Rockefeller Research Student in 19 and was appointed demonstrator in biochemistry that University in the following year. In 1935 was appointed lecturer in pharmacology in th University of Sheffield, a post which was afterwar converted to that of lecturer in biochemistry a then to professor. Since 1945 he has also be director of the Medical Research Council Unit f Research in Cell Metabolism at Sheffield.

Prof. Krebs's work has largely been concerne with the study of metabolic processes *in vitro*. 1932, in collaboration with Henseleit, he propose a mechanism for the formation of urea in the liv with the participation therein of ornithine, citrulli and arginine by means of a cyclical process, a theo that was afterwards the centre of controvers although it is now widely accepted. In 1937 he p forward his now classical citric acid cycle as a pat way of oxidation of carbohydrate, and it has sin become clear that this cycle is concerned not on with oxidation of carbohydrate but also with th of fat and of protein. Indeed, as the years ha passed, the importance of the citric acid cycle h grown rapidly, and Krebs's original idea has be amplified rather than modified. More recent Krebs and his colleagues have been especially int ested in the movement of substances across me branes, and the significance of such movements metabolic processes in general. His Medical Resear Council Unit will accompany him to Oxford, and is to be hoped that there will be no more than slight interruption of research as the result of th move.

Evidence for the Antiproton

It is firmly believed by most theoretical physici that the antiparticle to a proton can exist. Inde if the proton is to be described by a modification the Dirac equation, the existence of negative ener states is required. This particle should bear the sa relation to a proton as does the positron to an el tron. Should it be possible to create such a parti by a proton–nucleon collision, the incident proton will require a kinetic energy of at least $5 \cdot 6 \times 10^9$ electron volts. At present only one particle accelerator, the Berkeley 'Bevatron', exists which is designed to reach this energy. At this energy the production of antiprotons is not expected to be very copious, and their abundance relative to other particles formed will probably be far smaller than in many cosmic ray phenomena which have already been extensively investigated. The problem of the conclusive identification of the antiproton may be a difficult one for some time to come. A direct mass and sign measurement might be expected to identify it. However, this would require a high precision to distinguish it from known negative heavy mesons of mass greater than half the proton mass. Further, any such direct mass and sign determination could, in itself, always be attributed to a new type of negative heavy meson.

There is a characteristic feature of an antiproton that should render its identification more simple. On coming to rest in matter, an antiproton should be attracted into the nucleus of an atom and annihilate itself and one ordinary proton. This process, liberating as fast mesons (or less probably γ-rays) twice the rest energy of the incident particle, is by definition unique to an antiparticle, and should be readily observed. One cosmic ray event has been seen in a multiplate cloud chamber by DeStaebler, Bridge, Courant and Rossi (*Bull. Amer. Phys. Soc.*, **29**, No. 4, 74; 1954), which is consistent with this process, and hard to reconcile with an alternative explanation. Within the past year the use of large blocks of nuclear emulsions, and the combination of magnet and multiplate cloud chambers, have both greatly increased the amount of information that may be obtained from the observation of a single particle. It is quite possible that with the aid of these techniques conclusive evidence for the existence of the antiproton may be found in the near future. Moreover, it may become possible to identify the annihilation products of machine-produced antiprotons by a counter experiment, even if the particle is not detected.

Recollections of Lord Rutherford

At the request of a number of its Fellows, the Physical Society has reprinted the first five of its Rutherford Lectures in a booklet entitled "Rutherford by those who knew him" (pp. 69; from the Physical Society, 1 Lowther Gardens, London, S.W.7; 1954; 5*s*. to members or 8*s*. 6*d*. to non-members, with 6*d*. postage). All five Lectures are reminiscent in character and are obviously tributes by men who, like so many, if not all, of Rutherford's research workers, had fallen under the magic spell of their chief. There are a number of illustrations, some of which are rather charming in that they are snapshots, for the most part rather poor ones, taken from photographic albums and no doubt highly prized by their owners; unfortunately, the reproductions are very poor. The Lectures are by Prof. H. R. Robinson (Manchester period); Sir John Cockcroft (Cambridge period); Prof. M. L. Oliphant; Dr. E. Marsden; and Dr. A. S. Russell (Manchester period). Perhaps the Lectures by Prof. Robinson, Sir John Cockcroft and Dr. Russell are the more personal, or even anecdotal, of the five; Prof. Oliphant's Lecture is an attempt, in all too short a space, to appraise the impact of Rutherford and his work upon the science and life of the present time, and Dr. Marsden, as befits the only New Zealander, for the most part emphasizes the importance of Rutherford's early New Zealand background in the development of his character. The Lectures make fascinating reading, because their subject was a fascinating personality. Perhaps none has summed up Rutherford better than the late Sir James Jeans in a tribute shortly after Rutherford's death: ". . . In his flair for the right line of approach to a problem, as well as in the simple directness of his methods of attack, he often reminds us of Faraday, but he had two great advantages which Faraday did not possess—first, exuberant bodily health and energy, and second, the opportunity and capacity to direct a band of enthusiastic co-workers. Great though Faraday's output of work was, it seems to me that to match Rutherford's work in quantity, as well as in quality, we must go back to Newton. Rutherford was ever the happy warrior—happy in his work, happy in its outcome, and happy in its human contact".

Nuclear Reactor in Stockholm

On July 13 a nuclear reactor moderated with heavy water and using natural uranium was started in Sweden. The reactor, which is of the *CP* 3 type, has been built by the Atomic Energy Co. in Stockholm, a company jointly owned by the Government and private industry. The reactor is located in an underground room in the neighbourhood of the Royal Institute for Technology. Construction was started in the middle of 1951. The designed power is 300 kW. and the heat is dissipated by circulating the moderator through a heat exchanger, where it is cooled by air.

Work of the British Council

The tribute to the value of the work of the British Council which was paid six years ago by the Select Committee on Estimates was fully endorsed on both sides of the House of Commons in the debate on Overseas Information Services on July 6. That debate arose essentially out of the failure of the Government to reach any decision on the recommendations for the re-organization of these services in the report presented a year ago by Lord Drogheda's Committee. The second annex to that report, of which a summary was published in April last (Overseas Information Services. Miscellaneous No. 12 (1954): Summary of the Report of the Independent Committee of Enquiry into the Overseas Information Services. (Cmd. 9138.) Pp. 56. (London: H.M.S.O., 1954.) 1*s*. 9*d*. net), reviews the work and requirements of the British Council and, while making proposals for curtailment and rearrangement of the Council's work in Europe, stresses the value of the work being done elsewhere. The Drogheda Committee was well impressed with the standard of the staff in those British Council centres it visited, and directs attention in this report to the importance of establishing a long-term programme for British Council work overseas and sticking to it if staff of high quality are to be attracted and freed from the atmosphere of frustration and uncertainty in which the Council works to-day. The recommendations of the Drogheda Committee, including provisions for pensions, staff allowances, etc., would increase the total annual grants to the British Council by about £630,000, thus restoring the position to about what it was during 1948–49. What it believes the British Council needs more than anything else is a five-year programme of development with some guarantee that the necessary funds will be provided for its execution.

This principle of the quinquennial grant found general support in the debate on July 6, and the need for continuity was admitted even by the Government spokesman, Mr. Anthony Nutting, though he declined to commit the Government to any specific action on the report; by implication, he rejected the essential recommendation of the Committee, namely, that information work, whether conducted by the British Broadcasting Corporation, the British Council, the Central Office of Information or individual Government Departments, should be viewed as a whole with its strategy planned and its finances guaranteed over a period of years. While it would thus appear that the Government is unwilling to accept the Drogheda Committee's suggestion of a permanent Advisory Committee, Mr. Nutting joined with other speakers in repudiating emphatically the attacks made on the British Council and its work, particularly those being made in the Beaverbrook press. The British Council Staff Association has recently replied to these attacks by publishing at its own expense a pamphlet entitled "The Beaverbrook Press and the British Council" (pp. 12; 6*d*.), and this pamphlet was commended by the Minister. It is just such occurrences which the Press Council was formed to investigate, and it is to be hoped that the Council will in due course take up the matter.

Ciba Foundation: Support for Gerontological Studies

THE Ciba Foundation has decided to support experimental work and basic investigations into the problems of ageing as an additional item in its general programme for the promotion of international co-operation in medical and chemical research. An extra sum of money has consequently been set aside for gerontological studies over the next five years, and these studies will take the form of regular colloquia, informal discussion meetings, lectures, special awards and travelling fellowships. The recent colloquium on "Aspects of Ageing", held by the Foundation during July 14–16, was the first of a series in this field, and the proceedings of this colloquium will be published as a series of volumes on lines similar to the Foundation's well-known "Colloquia on Endocrinology". When the opportunity occurs, guests staying in the Foundation with special knowledge in gerontology will be invited to open informal discussion meetings. The annual Ciba Foundation Lectureship will be open to distinguished workers in the field. For the Foundation's awards for original researches, candidates are invited to submit unpublished work (though it may be under consideration for publication), and prize-winning entries may be printed in English and bound periodically to form a separate series of volumes representing international progress in the field. It is proposed to make five such awards in the first year, of an average value of £300 each, but the size and number of the awards may be varied according to circumstances. The Foundation will also from time to time make grants for travelling fellowships, especially where it is considered that candidates would benefit from a visit or visits to laboratories in another country.

Cairngorms Nature Reserve

THE declaration by the Nature Conservancy in Edinburgh on July 9 of the Cairngorms Nature Reserve brought into existence much the largest nature reserve in Great Britain and one of the largest in Europe. The 62 square miles, or 39,689 acres, now declared omits Cairngorm but includes the three highest summits and is slightly larger than the 38,000 acre area originally recommended by the Scottish Wild Life Conservation Committee. Only about one-eighth of the area, covering the higher lands of Invereshie, has been bought by the Conservancy. The remainder is brought in under a series of nature reserve agreements which are the first under Section 16 of the National Parks and Access to the Countryside Act, 1949, to be completed between the Nature Conservancy and private landowners. It is also planned later to enlarge the Reserve, which is intended to preserve as nearly as possible unchanged this grand stretch of country and its highly interesting wild life and vegetation for the enjoyment of the present and future generations and for scientific study. There will be no charge as regards access, but formalities will be required for those wishing to undertake research, to take specimens of animals or plants (which will be prohibited except for scientific purposes) or to obtain permits for camping. Applications for collecting or other scientific purposes should be addressed to the Nature Conservancy at 12 Hope Terrace, Edinburgh 2. Two Conservancy wardens are already in residence and will be glad to inform and assist visitors. Deer-stalking, grouse-shooting and the destruction of a few undesirable pests will continue, but special protection zones have been arranged for ptarmigan, and no birds of prey except sparrowhawks will be killed.

A strong Cairngorms Consultative Panel has been established to advise the Conservancy on all matters affecting public rights and interests, including mountain rescue arrangements, and the Conservancy hopes to assist in the provision of footbridges and the care of mountain shelters. The programme of scientific investigations will probably include the natural regeneration of native Scots pine in the remnants of the Caledonian Forest, the ecology of mountain birds, plants and insects, and high-altitude meteorology. The primary object of the Reserve, however, is to safeguard its characteristic Highland wild-life, including the golden eagle, ptarmigan, dotterel, snowbunting, blackcock, greenshank, crested tit and Scottish crossbill, as well as red deer and roedeer, wild cat and other mammals, and more than two hundred species of flowering plants and hundreds of species of non-flowering plants and invertebrates, many of which are of considerable rarity and interest.

Society for the Promotion of Nature Reserves

THE 1953 handbook of the Society for the Promotion of Nature Reserves gives an account of the eight reserves administered by the Society: Woodwalton Fen (Huntingdonshire), Dancer's End (Buckinghamshire), Meathop Moss (Westmorland), Badgeworth Marsh (Gloucestershire), the Coward Memorial Reserves (Cheshire), Mickfield Meadow (Suffolk), Sharpham Moor (Somerset) and Bellairs Great Wood (Essex). All these reserves were established in order to preserve certain rare plants, insects or birds, and each year their value becomes greater with increasing housing development and the consequent destruction of areas of interest to the naturalist. Among the species protected in the reserves are *Fritillaria meleagris*, *Ranunculus ophioglossifolius*, *Carex evoluta* and *Salvia pratensis*. The international aspect of Nature protection is described in the report of the meeting at Salzburg of the International Union for the Protection of Nature which was attended by more than a hundred people of thirteen different nationalities who met to discuss the effect of tourism on Nature protection and protection of fauna and flora in high altitudes. The handbook, price 5s., can be obtained from the Honorary Secretary, Society for the Promotion of Nature Reserves, British Museum (Natural History), Cromwell Road, London, S.W.7.

The Marsupial 'Tiger Cat'

EXCEPT for their uniquely spotted coats, in outward appearance and their flesh-eating habits the pouched dasyures or native 'cats' of Australia most nearly resemble foreign carnivores of the weasel family. Excellent photographs have been taken of a male and female of the much larger and generally fiercer 'tiger cat' which had been caught in the act of raiding poultry yards in Sydney; these are described by Ellis Troughton in a recent issue of the *Australian Museum Magazine* (11, No. 5; March 1954). Their captor, Mr. H. Grant, a retired sergeant of police, not only tamed these habitual raiders of the bush but also reduced them to a remarkable state of docile affection. After their capture about six months ago, five young were discovered attached to teats within the shallow-edged pouch of the mother. Their lusty growth gave opportunity for most interesting observations in captivity. The yellowish-brown tiger cat, which is the largest of the native cat group, attaining a length of 4 ft. from nose to tail-tip, is distinguished by having the creamy white spots extending down the tail, instead of being restricted to the body as in all the smaller native cats. Despite size, the tiger cat is an expert climber with a well-developed great-toe which is lacking in he more terrestrial native cats. It has been seen to eap from topmost branches of trees to catch roosting owls by the neck, killing them in the act of falling with the body to the ground. The tiger cat is plentiful in Tasmania, which has become the last refuge of he largest known marsupial carnivore, the 'pouched wolf' or 'tiger'. It inhabits eastern Australia from he southern border of South Australia to the Cairns egion of Queensland, where a smaller geographical ace (*gracilis*) is known to occur.

Diseases and Pests on Horticultural Planting Materials

THE Ministry of Agriculture and Fisheries has prepared a special guide, by Mr. P. Aitkenhead and Dr. J. A. Tomlinson, entitled "Diseases and Pests on Horticultural Planting Material: a Guide to their Recognition" (pp. 38. London: H.M.S.O., 1953; s. net), designed primarily for the information f the Ministry's inspectors in their new duties under the Plant Protection Convention, 1951, of the Food and Agriculture Organization, which requires, among other things, inspection of consignments of plants moving in international traffic. A large number of insect pests and fungus diseases is described n the guide. The style is almost terse, but quite dequate for the purposes of a field-book setting orth to give a specific *ad hoc* determination against general background of phytopathological knowedge. Host plants are, most conveniently, listed lphabetically, and the guide deals with the semi-ormant planting forms of ornamental and useful lants. Perhaps the most useful feature, however, will be the eighty-three excellent half-tone illustrations; these are from many sources, and certainly enhance the booklet.

Bell Solar Battery

THE June number of the *Bell Laboratories Record*, the semi-popular journal published by the Bell Telephone Laboratories, Inc., of New York, is of unusual topical interest by reason of some articles on transistors, and especially of an account of a new silicon device termed the Bell solar battery. The recent use of silicon in semi-conducting devices is the culmination of more than twenty years of work at the Bell Laboratories, and the solar battery is the result of the development by G. L. Pearson, C. S. Fuller and D. M. Chapin—physicist, chemist and electrical engineer, respectively—of a successful device for converting the sun's energy into electricity. In its present experimental form, the battery has an efficiency of 6 per cent and is expected to reach 10 per cent, in contrast with other photo-electric devices which have never achieved more than 1 per cent. The battery is constructed of wafer-thin silicon strips about the size of razor blades; these are linked together electrically to deliver power from the sun at the rate of 50 W. per square yard of surface. Illustrations accompanying the article refer to possible applications to the driving of a small electric motor and to the operation of a mobile radio transmitter.

International Scientific Radio Union

THE eleventh General Assembly of the International Scientific Radio Union (U.R.S.I.) will be held in The Hague during August 23–September 2. A report on the previous meeting, which was held in Sydney, was published in *Nature* (171, 628; 1953), and this included a full list of the officers of the Union elected for the forthcoming assembly. The Union is composed of national committees which contribute by subscription to its income, and, as a result, are entitled to official representation and participation in the scientific work before and during each General Assembly. The British National Committee for Scientific Radio is organized under the auspices of the Royal Society with Sir Edward Appleton as chairman. This committee has nominated a British delegation comprising a number of scientists directly interested in various aspects of measurements and standardization, radio-wave propagation, atmospherics, radio astronomy and the scientific problems of electronics, waves and circuits. Some of these delegates will be responsible for submitting, on behalf of the British National Committee, reports to the General Assembly reviewing the advances made in the United Kingdom in each of the fields of research indicated by the seven commissions of the Union. These reports and the corresponding ones submitted by other national delegates will be supplemented by other original contributions describing recent research work of direct interest to the international aspects of scientific radio. The General Assembly will also be considering the proposals for enhanced radio observations during the International Geophysical Year, 1957–58, as already incorporated in the preliminary programme drawn up by the special committee composed of representatives of all the international scientific unions interested in this work.

Physical Society: Forthcoming Meetings

A CONFERENCE on "The Physics of the Ionosphere" has been arranged by the Physical Society and will take place at the Cavendish Laboratory, Cambridge, during September 6–9. The Conference, which is being organized by Mr. J. A. Ratcliffe, will be devoted mainly to a discussion of the following topics: (*a*) the lowest ionosphere; (*b*) irregularities and movements in the ionosphere; (*c*) the ionospheric *F*2 layer; (*d*) the mathematics of wave propagation through the ionosphere. Accommodation can be provided at Cambridge; application forms, which are obtainable from the offices of the Physical Society, should be returned to the Cavendish Laboratory, Cambridge, before August 16.

The seventh Rutherford Lecture of the Physical Society will be delivered by Prof. P. M. S. Blackett on November 26 in the Lecture Theatre, Science Museum, Exhibition Road, London, S.W.7, at 5 p.m. His subject will be "The Organization of Scientific Discovery". At a Science Meeting of the Society to be held on November 5, at 5 p.m., in the Lecture Room, Royal Astronomical Society, Burlington House, London, W.1, the Duddell Lecture will be delivered by Prof. A. C. B. Lovell on "The Development and Use of Large Radio Telescopes", and the Charles Vernon Boys Lecture will be given by Dr. J. S. Courtney-Pratt on "Some New Methods of Fast Photography". These lectures are open to non-members of the Society.

United States Fellowships for British Scientists

NINE fellowships for research in American institutions have been awarded to British scientists under a technical assistance programme sponsored by the United States Foreign Operations Administration. This will bring to eleven the number of fellowships awarded to British scientists since the inception last year of this programme, which provides for about a hundred and fifty younger scientists from fourteen Western European countries to undertake advanced study at American universities and research institutions, about twenty-five of the total being from the United Kingdom. The latest British awards, which have been made by the National Academy of Sciences, Washington, D.C., on the nomination of the Royal Society of London, are to the following for study at the institutions indicated: Dr. D. R. Bowsher (assistant lecturer in anatomy, University of Liverpool), Harvard Medical School; L. Castillejo (lecturer in physics, University College, London), Cornell University; Dr. B. R. Coles (lecturer in metal physics, Imperial College of Science and Technology, London), Carnegie Institute of Technology; Dr. F. M. Dean (lecturer in organic chemistry, University of Liverpool), University of California; Dr. R. F. Evans (Chemical Research Laboratory, Teddington), Purdue University; Dr. V. A. Knivett (Chemical Research Laboratory, Teddington), University of Wisconsin; A. G. Milnes (Royal Aircraft Establishment, Farnborough), United States Naval Ordnance Laboratory, Silver Spring, Maryland; Dr. J. Owen (Magdalen College, Oxford), University of California; and Dr. E. M. Thain (Lister Institute of Preventive Medicine, London), University of California.

Heriot-Watt College, Edinburgh: Fellowships

HONORARY fellowship of the Heriot-Watt College, Edinburgh, has been conferred on the following, all of whom are former students of the College: Mr. C. Batey, printer to the University of Oxford; Mr. R. C. M. Dickson, Scottish representative director of Boots Pure Drug Co., Ltd.; Mr. W. B. Laing, general manager of Bruce Peebles and Co., Ltd., Edinburgh; Sir William Paterson, chairman and managing director of the Paterson Engineering Co., Ltd., London; and Dr. Rameshawr P. Sinha, principal of Dhanbad School of Mines, India. Fellowships by thesis have been awarded to the following: Ralph A. Aitken (enzymolysis of cell-wall material with special reference to the malting process), and Sailendra N. Ghosh (new network analyser).

Society for Applied Bacteriology: Officers

THE following have been elected officers of th Society for Applied Bacteriology: *President*, Mr S. B. Thomas; *Secretary*, Mr. G. Sykes (Boots Pur Drug Co., Ltd., Microbiology Division, Nottingham) *Treasurer*, Mr. C. S. Miles; *Editors*, Dr. S. E. Jacob and Dr. L. F. L. Clegg; *Publications Manager*, Mr E. A. Whitlock; *Advertising Manager*, Mr. E. J Mann; *Ordinary Members of the Committee*, Dr L. A. Allen, Mr. K. R. Butlin, Mr. J. W. Egdell Dr. L. D. Galloway, Dr. A. Hirsch, Dr. M. Ingram Mr. D. A. McKenzie, Mrs. A. C. Stirling and Dr Helen R. B. White.

Announcements

THE Scientific Instrument Manufacturers' Association has elected as its president for 1954–55 Mr C. E. T. Cridland, chairman and managing directo of a group of companies which includes Aldi Brothers, Ltd., of Birmingham. Mr. Cridland wa trained as an electrical engineer, and has bee connected with engineering industry all his life particularly electrical and aeronautical engineering.

THE Committee representing the Royal Society and the Armourers and Brasiers' Company ha appointed Mr. K. E. Puttick to be Armourers an Brasiers' Company Research Fellow from October 1 1954, to work at the H. H. Wills Physical Laboratory, University of Bristol, on the structure and deformation of pearlite.

THE Council of the Royal Society has awarde Mr. and Mrs. John Jaffe Donation Studentships fro October 1, 1954, to the following: Dr. Eileen N. Richardson, to work at the Physical Chemistry Laboratory, University of Oxford, on the kinetics o bromination of selected aromatic compounds; an Mr. A. Korner, to work at the Department of Biochemistry, University of Cambridge, on the influenc of hormones on metabolism.

AN award under the Royal Society and Nuffiel Foundation Commonwealth Bursaries Scheme together with financial support from the Board of th Dairy Research Institute, Palmerston North, Ne Zealand, has been made to Dr. S. Y. Thompson, o the National Institute for Research in Dairying Reading, to enable him to visit the former Institut in 1955 in order to study factors controlling th vitamin A potency of New Zealand butter.

THE University of Padua is offering a Gabriell Zuccari scholarship of 300,000 lire for research of a least six months duration at the Zoological Statio Naples, during the academic year 1954–55. Th scholarship is open to any person who wishes t undertake research in zoology, comparative anatomy physiology or embryology. Application forms (to b returned by October 30) can be obtained fro the Secretariat of the University of Padua.

ERRATUM. In the communication of May 15 p. 956, on the "Life-history of the Rat Lung-wor and its Migration through the Brain of its Host' by Dr. M. Josephine Mackerras and Miss Dorothea F Sandars, the two illustrations should be interchange

UNIVERSITY AFFAIRS IN GREAT BRITAIN, 1952–53

THE "Returns from Universities and University Colleges in receipt of Treasury Grant for the Academic Year 1952–53"*, issued by the University Grants Committee, shows a further decline of 1,984 in the number of full-time students—to 81,474, compared with 83,458 in 1951–52 and 85,314 in 1950–51. In the English universities, full-time men students decreased by 1,231, but women students increased by 282; for Wales the corresponding figures were 259 and 17, while for Scotland there were 694 fewer men and 99 fewer women. Overseas students from within the British Commonwealth increased by 318 to 4,239 full-time and 1,842 part-time students, and students from foreign countries by 190 to 3,229 full-time and 1,302 part-time students. While there was no significant change in the percentage distribution of full-time students among the faculties, there was no evidence of any increase where it appears to be required in the national interest. Arts students decreased by 1,020 to 34,916, but those in pure science decreased by 52 to 17,001 and those in technology by 222 to 9,993. Students of medicine decreased by 399 to 13,511, of dentistry by 174 to 2,715, of agriculture by 139 to 2,279, and those of veterinary science increased by 22 to 1,059. Full-time advanced students of pure science, however, increased by 187 to 3,045, and those of technology by 52 to 1,157 and of agriculture by 7 to 281; students of medicine and dentistry decreased by 44 to 963, of veterinary science by 3 to 7, and of arts by 10 to 3,304, while those working for a teacher's diploma decreased by 76 to 2,900. Of the full-time students, 64,753 were reading for a first degree, 5,064 for a first diploma and 11,657 were engaged in research or other advanced work, the corresponding figures for 1951–52 being 66,409, 5,505 and 11,544, respectively.

The proportion of assisted students was slightly smaller (70·4 per cent compared with 72·4 per cent during 1951–52); for England as a whole, it decreased only from 73·8 to 72·9 per cent, but in Wales it decreased from 88·3 to 81·1 per cent, and in Scotland from 61·6 to 55·7 per cent. The dependence on Parliamentary grants, however, continued to increase and is now 69·6 per cent of recurrent income, only 12·7 per cent coming from fees, 4·4 per cent from endowments, 3·6 per cent from local-authority grants and 1·6 per cent from donations and subscriptions. Two years ago (1950–51) the corresponding figures were 16·6, 5·2, 4·1 and 1·9 per cent, respectively, with 64·9 per cent from Parliamentary grants. The ratio of staff to students continued to improve, the full-time teaching staff being now 9,098, compared with 8,952 during 1951–52 and 8,603 during 1950–51. The increase was chiefly in readers, assistant professors and independent lecturers (38), senior lecturers (71) and lecturers (364), with a further decrease of 255 in assistant lecturers and demonstrators to 1,282.

Of the full-time students, 62,635 were in England, 4,621 in Wales and 14,218 in Scotland. Of these, 14,717 were at Oxford and Cambridge, 18,199 at London and 29,719 at other English universities and university colleges. There were slight decreases at all universities and university colleges, except Bristol (+ 9), Reading (+ 60), Exeter (+ 35) and North Staffordshire University College (+ 117), but only at Cambridge (– 152), Oxford (– 119) and Liverpool (– 182) was the decrease more than one hundred. The proportion of full-time students residing in colleges and halls of residence increased to 27·3 per cent; of these 22,269 students, 7,977 were at Oxford and Cambridge, 11,367 at other English institutions and only 1,188 in Wales and 1,737 in Scotland. The proportion of men in residence was 22·9 per cent and of women 41·3 per cent, while 32,559 students (40 per cent) were in lodgings and 26,646 (32·7 per cent) at home, compared with 39·6 per cent and 34·5 per cent during the previous year. Of the 21,355 students admitted for the first time during 1952–53 (a decrease of 1,059 on 1951–52), 19,683 were reading for a first degree, and 1,672 for a first diploma; and of those reading for a first degree, 1,612 were under eighteen years of age, and 10,679 were nineteen or more. Of the full-time students, 35,057 out of 48,044 men and 10,607 out of 14,591 women in England were receiving assistance in the way of scholarships, exhibitions or other awards from public or private funds; for Wales the corresponding figures are 2,588 out of 3,287 men and 1,161 out of 1,334 women; and for Scotland 5,942 out of 10,455 men and 1,980 out of 3,763 women. Of 61,786 full-time men students, 36·3 per cent were in arts, 21·9 per cent in pure science, 17·2 per cent in medicine and 15·9 per cent in technology; for the 19,688 women students the corresponding figures are 63·4, 17·5, 14·7 and 0·9 per cent, respectively. Medicine and dentistry claimed 49·1 per cent of the part-time advanced students, arts 33·8, technology 9·0, and pure science 7·5 per cent, compared with 51·1, 33·0, 8·0 and 8·7 per cent, respectively, during 1951–52.

The recurrent income of the universities and university colleges of Great Britain increased by £3,950,084 to £29,698,083, of which £20,682,415 was from Parliamentary grants, £3,764,749 from fees, £1,311,884 from endowments, £1,065,913 from grants from local authorities and £483,416 from donations and subscriptions. Of the total income from public funds of £21,748,328, and £7,949,755 from other sources, the University of London received £6,660,992 from public and £2,330,982 from other sources; the University of Cambridge similarly received £1,358,177 and £1,278,658; for Oxford, the corresponding figures are £1,220,380 and £733,576; Manchester, £1,068,409 and £265,774; Leeds, £891,496 and £259,220; Durham, £961,460 and £342,640; Birmingham, £856,834 and £252,077; Liverpool, £866,006 and £236,745; Bristol, £777,240 and £316,801; Sheffield, £544,693 and £165,201; Reading, £513,506 and £61,316; and Nottingham, £478,565 and £106,604. No other English university or university college had an income exceeding half a million pounds; but for the four universities in Scotland the corresponding figures were: Aberdeen £494,000 and £136,754; Edinburgh, £1,039,430 and £346,812; Glasgow, £1,021,000 and £349,223; and St. Andrews, including Dundee University College, £529,000 and £109,658. The University of Wales, including the Welsh National School of Medicine, received £1,096,545 from public funds and £309,189 from other sources.

---

* University Grants Committee. Returns from Universities and University Colleges in Receipt of Treasury Grant, Academic Year 1952–53. (Cmd. 9130.) Pp. 44. (London: H.M.S.O. 1954.) 2s. 6d.

Of the total expenditure of £28,700,434, an increase of £2,568,312 or 9·8 per cent on 1951–52, administration accounted for 7·7 per cent, departmental maintenance 68·9 per cent, maintenance of premises 12·5 per cent, and miscellaneous expenditure 9·7 per cent. Capital expenditure met from income amounted to £334,516, and allocations to reserve to £334,015; for 1951–52 these figures were £258,963 and £222,536, respectively. Departmental maintenance, which includes salaries of teaching staff, payments for superannuation, the running costs of laboratories, lecture rooms, libraries and museums, and the supply of materials, apparatus, books, specimens, etc., increased by £1,665,428 to £19,761,880, and expenditure on the maintenance of buildings increased by 26·4 per cent. Salaries and superannuation amounted to £13,169,879 compared with £12,542,994 during 1951–52, the increase being 5 per cent for the teaching staff and 18·5 per cent for technicians and laboratory assistants.

Library expenditure, excluding general maintenance of library buildings, etc., rates, heat, light, repairs, etc., amounted to £1,118,428, or 3·9 per cent of the total expenditure, compared with 3·8 per cent during 1951–52 and 3·7 per cent during 1950–51. Of this total, £557,656 was for salaries and wages, £135,907 on periodicals and £90,072 on bindings. Of the £276,852 expended on books, £174,548 was in the schools and colleges of the University of London, including £9,800 at the Central Library, £7,222 at University College, £6,883 at the London School of Economics and £5,846 at the School of Oriental and African Studies. The University of Oxford spent £39,404 on books, Cambridge £16,014, Manchester £12,955, Liverpool £10,016, and Durham £10,265. The University of Bristol spent £9,739 on books, and the University of Southampton's expenditure of £9,152 is noteworthy in view of its smaller number of students; but although expenditure on books and periodicals continued to increase slightly, the upward trend was scarcely in proportion to the mounting costs of both books and periodicals. Only the Universities of London (£38,582), Cambridge (£10,247) and Oxford (£11,417) spent more than £10,000 on periodicals, and only Birmingham (£5,770), Leeds (£5,055) and Manchester (£5,460) more than £5,000. The University of Wales spent £11,869 on books and £7,987 on periodicals; in Scotland, Edinburgh spent £13,625 on books and £6,071 on periodicals; Glasgow, £13,421 and £7,711; Aberdeen, £6,619 and £3,733; and St. Andrews, £8,113 and £4,350.

SCIENCE IN THE EXTRA-MURAL WORK OF UNIVERSITIES

A SURVEY of some aspect of adult education from the pen of the *doyen* of heads of university extra-mural departments* is bound to attract attention and interest, and it is to be hoped that this essay will be carefully studied in responsible quarters. It will repay careful study, for there is much wisdom and good sense in its pages; but at the same time there is little to inspire, and the tone is cautious, almost apologetic. Thus, on p. 9 are set out the figures for courses in the sciences in relation to the total number of courses arranged by the universities and the Workers' Educational Association during the session 1952–53. Science provides 10 per cent of the total, and, while acknowledging that this represents "a considerable advance" on the 4 per cent of an earlier survey in 1925–26, Prof. Peers describes it as "remarkably low". In fact, however, an examination of the figures for all subjects scarcely confirms this judgment. In a total number of courses of 3,755 the physical and biological sciences, with 378, are exceeded by language and literature (623), the arts (599), history (597) and social studies (459). But the sciences in turn exceed international affairs (289), psychology (231), philosophy (186), religion (180) and government (128): biology alone provides more courses than philosophy, religion or government, and the physical sciences, with 167 courses, fall little short of religion. Given the inherent difficulties, which Prof. Peers does not fail to bring out, the position is less unsatisfactory than he suggests. Something must be allowed for variations in length of courses; but it remains remarkable that, in times like the present, international affairs should be less well represented. The student quoted by Prof. Peers who preferred "not to know the details" of the atom bomb that might blow her to pieces would seem to be as critical of international affairs as a subject of study. Here, perhaps, Prof. Peers's judgment is understandably coloured by the fact that his Department has a greater number of courses in international affairs than any other in the kingdom.

Nevertheless, Prof. Peers's approach is a sound one: "The real case for science as part of the general education of the adult citizen is exactly the same as the case for history, literature and the social sciences . . . without a knowledge of science he cannot live the best and most satisfying life of which he is capable: a whole range of experience, æsthetic as well as practical, is closed to him". This is well said, and the point is developed in some valuable paragraphs (pp. 6–7). It is doubtful, however, whether this view is sufficiently widely held in adult education circles. Prof. Peers quotes a science tutor's opinion as to the disadvantages caused by the unfamiliarity of organizers and administrators with science, only to brush it aside. He does not, however, seem to make sufficient allowance for the existence of latent demand. His argument that "it is not the business of Extra-mural Departments to use methods of persuasion to induce adult groups to choose one subject rather than another" begs the question, and reflects the conditions of an earlier period when 'demand' could be more easily recognized and satisfied. The task of the present in adult education, despite the great increase in the number of courses, is not to meet a recognizable and clamant demand, but to investigate society in order to ascertain where and how the universities, and other providers, can both stimulate and satisfy needs and interests. Prof. Peers offers some observations, based on the experience of several universities, on this aspect of the problem; but the investigation needs to be carried further and to be illustrated with actual syllabuses. His conclusion that little can be done "until science is given its proper place in the general curriculum of the schools" is open to question. Despite the arguments he offers, it is doubtful whether recollection of studies at school often encourages adult students to attend courses in any subject. Nor is his criticism of "the absence of suitable text books" particularly valid, while his concern with "expensive microscopes and micro-projectors" as "a *sine qua non* of effective work" suggests a limited and specialist approach. It may be questioned, too, whether the claim that "the same objective methods" are used in the social sciences as in the physical can altogether be justified, while the criticism that the scientist is not necessarily dispassionate in his political or sociological judgments does not get us far: few of us would care to make even academic philosophers our kings.

---

* Science in the Extra-Mural Work of Universities. By Prof. Robert Peers. Pp. 19. (Bristol: Universities Council for Adult Education, 1954.)

Yet Prof. Peers offers some useful suggestions as to the development of courses in the sciences, and puts the subject in its proper perspective by proposing the establishment of science sub-departments of extra-mural departments, with the aim, above all, of achieving "the reintegration of science as an indispensable part of a liberal education". As a non-scientist he has rendered a valuable service in opening the subject for discussion: it is to the scientists in adult education that we now look for a more developed statement.

NUTRITION AND THE LIVER

SYMPOSIUM IN GLASGOW

On May 8 the Scottish Group of the Nutrition Society held a symposium on "Nutrition and the Liver" in the Biochemistry Department of the University of Glasgow under the chairmanship of Prof. J. N. Davidson, head of the Department. This meeting provided an opportunity for workers in fields ranging from academic biochemistry to clinical medicine to pool their knowledge. Prof. Davidson introduced the subject with a short paper entitled "The Chemical Architecture of the Liver Cell", in which he described the technique of differential centrifugation, by means of which liver cells may be separated into a nuclear fraction, mitochondria, microsomes and the cell sap. He pointed out that mitochondria isolated in this way are morphologically different from mitochondria as seen in the living cell; furthermore, they are not a homogeneous population, since they can be subdivided into several chemically and enzymologically distinct fractions. The microsomal fraction is composed of minute particles, but these may represent the disintegration products of a reticulum in the cytoplasm of the living cell. Prof. Davidson then demonstrated that, although most chemical constituents of the liver are considerably affected by variations in nutritional status, the total amount of one component, deoxyribonucleic acid, remains unchanged even in the face of extreme dietary variations; the quantity of this component is determined solely by the number of cells present. Consequently, deoxyribonucleic acid can be used as a reference standard against which changes in other liver cell constituents can be measured. Examples were given of the misleading results which may be obtained when liver composition is expressed per 100 gm. of fresh tissue, and the clarification in interpretation which follows the expression of results in relation to deoxyribonucleic acid.

The influence of the protein and energy content of the diet on liver composition was considered by Dr. H. N. Munro (Department of Biochemistry, Glasgow). The amount of protein in the liver is considerably affected both by the level of protein and of energy intake. These changes in protein content occur much more rapidly and extensively in the liver than in most other tissues of the body. This has led to the supposition that the liver may contain a store of protein which is readily depleted under adverse nutritional conditions; but attempts to demonstrate a chemically discrete storage protein have not met with success. In parallel with changes in the protein content of the liver, there are also variations in ribonucleic acid and phospholipid content. These changes occur without any alteration in cell number, and the material so gained or lost has been named "labile liver cytoplasm" (Kosterlitz). By means of differential centrifugation of the liver into fractions, it has been shown that a reduction in protein intake causes a loss of protein from all parts of the liver cell, of ribonucleic acid principally from the microsomes, and of phospholipid from the microsomes and cell sap. Thus the material lost from various parts of the liver cell is not uniform in composition. Although the amount of ribonucleic acid is reduced by protein deficiency, its rate of synthesis seems to be independent of protein intake and to be determined by the level of energy intake. Dr. Munro concluded by suggesting that the failure to identify the labile protein of the liver with any single chemical or morphological entity within the liver cell could be readily explained if differences in the rates of protein synthesis in different tissues are considered. Such differences in rate will determine the speed with which these tissues adjust their protein content to altered dietary conditions. The liver, being among the most active in protein synthesis, will become rapidly adjusted, giving the impression of gaining or losing a labile protein component.

Dr. J. M. Naftalin (Rowett Research Institute) dealt with the production of liver necrosis in rats by dietary means. In summarizing the history of this subject, he pointed out that the two dietary conditions generally believed to be necessary for the production of liver necrosis are deficiency of sulphur-containing amino-acids and lack of vitamin E. His own investigations were aimed at determining the influence of restriction of food intake and of environmental temperature on the incidence of liver necrosis among animals receiving necrogenic diets. He observed that 70–78° F. (21·1–25·6° C.) is the optimal temperature for producing necrosis on diets deficient in vitamin E and low in sulphur-containing amino-acids, the incidence being considerably less at temperatures higher or lower than this. In addition, caloric restriction with the same diet reduces the frequency of necrosis. A sufficient degree of food restriction prevents liver necrosis at all environmental temperatures, but too severe restriction leads to death without necrosis. Variations in the incidence of necrosis also occur when different preparations of casein are used as the protein source in the necrogenic diet. The incidence of necrosis was found to depend on the origin of the casein and to be independent of alcohol–ether treatment used for the removal of vitamin contaminants. It is not yet known whether caseins differ in necrogenicity because of the presence of a toxic factor in the high-incidence preparations or of a protective factor in the low-incidence preparations.

Dr. E. Kodicek (Dunn Nutritional Laboratory, Cambridge) contributed a paper on the storage of vitamins in the liver which summarized much recent work on the subject. He defined storage as the amount of a particular vitamin laid down in excess of the physiological level needed for normal functioning. From this point of view, the vitamins fall into two classes. The first group comprises those which occur in coenzymes or the prosthetic groups of enzymes, and for this group Dr. Kodicek proposed the name 'prosthetins'. Even with massive dosage, their concentration in the liver does not exceed a certain limit which probably represents saturation of the apoenzyme with the prosthetic group. Deficiency reduces the amount in the liver, but never to very low levels. These features are to be contrasted with the behaviour of the other group, the fat-soluble vitamins. Their concentration in the liver can be enormously increased by dosage (for example, to a hundred times the physiological level) or reduced to virtually zero by deficiency. The pattern of storage varies for the different fat-soluble vitamins. On dosage with vitamin A the efficiency of utilization can reach a maximum of 80 per cent of the amount fed, very high doses being toxic and leading to less efficient storage. By contrast, only a small fraction of administered vitamin D is stored in the body, most of it in the liver. Vitamin E is mainly found in the body fat; but dosage with this vitamin leads to a temporary increase in the liver concentration. It has recently been shown by Dam and his colleagues that deposition of vitamin K in the livers of chicks occurs only in response to dosage with the natural vitamin and not after administration of vitamin K substitutes; this may have therapeutic importance.

Dr. J. Waterlow (University College of the West Indies) described his experiences with disorders of the liver found in tropical countries in association with malnutrition. The chief forms of liver disease which are common in tropical climates are fatty liver and cirrhosis; massive necrosis is not more frequent than elsewhere. Fatty liver is found in very young children, and a severe form of fatty liver is a prominent feature of the kwashiorkor syndrome. The condition is nutritional in origin, probably the result of protein malnutrition in particular. In cases of fatty liver there is evidence of protein depletion, and Dr. Waterlow made the point that stigmata of protein insufficiency are not limited to the liver but are generalized, the organs most severely affected being those with the highest turnover of protein. Deposition of fat in the liver does not appear to be the fundamental factor determining the severity of the disease, which is probably dependent on the degree of protein depletion. The other common tropical liver condition, cirrhosis, does not appear to be an end-result of fatty infiltration, as has been demonstrated experimentally in rats. Geographically, there is little correspondence between the incidence of juvenile cirrhosis and of fatty livers in tropical countries. Dr. Waterlow suggested that juvenile cirrhosis may be produced by a combination of factors, one of which is malnutrition. Thus the occurrence of cirrhosis among West African children may result from a combination of malaria and malnutrition, the malnutrition being responsible for damage to the parenchymal cells and the malaria for overgrowth of fibrous tissue. In the West Indies the combination may be one of malnutrition and dietary toxins, arising from the widespread use of decoctions of plants ('bush tea').

The place of diet in the treatment of liver disease was discussed by Dr. A. L. Latner (Department of Chemical Pathology, Royal Victoria Infirmary, Newcastle upon Tyne), who described the nutritional principles underlying such treatment. He pointed out that, while a generous supply of protein in the diet is desirable for the regeneration of liver cells after the acute phase of liver damage is ended, the intravenous use of protein hydrolysates is irrational since the blood during severe liver damage already contains excessive amounts of amino-acids. There is, however, a good case for giving ample amounts of the vitamins. An interesting point made by Dr. Latner in this connexion was that the macrocytic anæmia associated with liver disease is relieved by folic acid but not by vitamin B_{12}. He also emphasized that liver diseases often cause profound disturbances of electrolyte metabolism which require correction. In acute liver failure Dr. Latner has obtained a high recovery rate by the intravenous use of glucose, saline, potassium chloride and massive doses of thiamine, nicotinamide and riboflavine, together with intramuscular injections of vitamins E and K. The dietetic treatment of some less acute forms of liver disease was also described.

Dr. A. J. Hale provided a microscopical demonstration of the minute anatomy of the liver for those attending the meeting. The communications will be published in the *Proceedings of the Nutrition Society*.

H. N. MUNRO

THIRD INTERNATIONAL RUBBER TECHNOLOGY CONFERENCE

THE Third International Rubber Technology Conference, held in London at Church House, Westminster, during June 22–25, under the auspices of the Institution of the Rubber Industry, was attended by some six hundred and twenty delegates from eighteen countries. About seventy-five of the delegates were accompanied by their wives, for whom a separate social programme of visits to places of interest had been arranged.

In declaring the Conference open, its patron, the Marquess of Salisbury, who was introduced by the president of the Institution of the Rubber Industry, Lord Baillieu, welcomed the delegates on behalf of the British Government. He recalled that it was six years since the last Conference of this type, and that the matters to be discussed interested many parts of the world and would be concerned with such important matters as synthetic rubber, combinations of synthetic with natural rubber, and chemical modifications of natural rubber itself. After the official opening, the chair was taken by Dr. W. J. S. Naunton, the chairman of the Conference, who announced that there would be in all seven sessions, each having its sectional chairman, who would be a well-known authority on the subjects to be discussed. Fifty papers covering a wide range of subjects, some highly scientific and others purely technological, had been pre-printed and already circulated to the delegates. These papers had been selected from the ninety offered as being likely to provide a source of stimulating discussion.

The first session, under the chairmanship of Mr. E. A. Murphy, consisted of eight papers on the properties of natural rubber latex. The subjects discussed included the variability of *Hevea* latex, with articular reference to differences in the phosphate/nagnesium ratios of different clonal latices, and the tructure of *Hevea* latex together with the influence f various chemical additives and treatments on its iscosity. Other papers dealt with the effect of arious naturally occurring mineral elements on field atex; and with the destabilization of ammoniated atex and soap-stabilized emulsions in the presence of omplex zinc diammine ions, which was suggested to e due to a decrease in hydration of the zinc diammine lilaurate, formed at the surface of the rubber particles. In an interesting paper E. W. Madge, H. M. ollier and J. L. M. Newnham described the study f viscosity changes in concentrated latex under lifferent experimental conditions to determine the nechanism of the thickening of latex by zinc xide. Small variations in the amount of natural oap have been found to be of great importance. ther papers described the peptizing of rubber by he addition of organic mercaptans to fresh latex, he production of improved rubbers by the enzymatic leproteinization of skim latex and the occurrence of nicrogel in latex and sheet rubber.

Two periods were devoted to the second session for he discussion of nine papers on synthetic rubbers, he chair being taken by Dr. Naunton himself. A aper which aroused much interest was one in which . F. Bloomfield, F. M. Merrett, F. J. Popham and . McL. Swift reported recent work on graft polymers lerived from natural rubber, thus still further arrowing the gap between natural and synthetic ubbers and indicating how man may modify and ometimes improve naturally occurring high polymer ydrocarbons. A somewhat related paper by D. H. offey and T. J. Meyrick described the preparation nd properties of condensation block copolymers of he polyester type. A paper entitled "How Synthetic Rubbers Affect You", by Mr. I. D. Patterson, lescribed synthetic rubber progress in terms of a ondensed time-scale and gave many interesting tatistics of production and use, concluding with he apt quotation from Browning, "The best is et to be". This paper provoked considerable liscussion.

Prof. A. A. Morton, well known for his considerable vork on the Wurtz reaction, presented a paper on he cation and anion influence in the 'Alfin' reagent or the polymerization of butadiene. He substantiated his remarks by producing from butadiene nd 'Alfin' catalyst a piece of synthetic rubber having molecular weight of about ten million, the whole rocedure taking less than five minutes, and in full iew of the audience. Among newer types of synthetic rubbers described were those derived from utadiene copolymerized with unsaturated ketones nd with 2-methyl-5-vinylpyridine, the last-mentioned type being capable of cross-linking by a quaternizing' reaction with organic halides. Other apers dealt with such subjects as the structure and olution properties of butadiene styrene copolymers f high molecular weight and the oil resistance f synthetic rubbers over periods up to fourteen ears.

The next session, under the chairmanship of Dr. . C. Bateman, was concerned with the chemistry of ubber. Six papers were introduced by their authors nd covered a wide field, including such subjects as article surface reactions, vulcanization by sulphur nkage and by atomic energy radiation, oxygen bsorption, and chemical reactions of antioxidants sed in vulcanized rubber. A paper on infra-red spectroscopic analysis of elastomers was also discussed in this section.

In the session dealing with the physics of rubber, the chair was taken by Dr. J. R. Scott, and six papers were discussed, while in the case of two papers, the authors of which were not present, written comments or questions were invited. A wide variety of topics in this section included such subjects as permeability, reinforcement, elasticity, effect of nuclear magnetism, compounds for low-temperature service, elastic behaviour of filler-reinforced rubbers, dynamic properties and time-dependent effects in tyre cords.

The chairman for the session on developments in testing methods was Mr. J. M. Buist, and six papers were presented for comment and discussion. The first, by B. Pickup, described a new apparatus for assessing tear-down adhesion. E. F. Powell and S. W. Gough gave interesting information on the constant power principle in abrasion testing, while the paper by J. I. S. Williams and R. G. Clifton gave information on the methods of testing pneumatic tyres. Still other papers dealt with tyre cord fatigue, changes in electrical resistance with different black loadings, and a test for easily measuring the degree of vulcanization of rubber.

The sixth session (chairman, Dr. D. Parkinson) concerned itself with the theory and practice of compounding, and eight papers were delivered on many subjects, such as reinforcement by various means, oil-extending of natural rubber and the interaction of rubber and fillers during milling. As would be expected, several of the papers dealt with properties of various carbon blacks in rubber. An outstanding paper in this section was that by Dr. I. Drogin, who gave clearly and concisely a mass of detail on the properties of the various carbon blacks.

The final session dealt with miscellaneous technology, with Dr. J. G. Mackay taking the chair. Four papers all concerned with, or related to, tyres were grouped in this section, the individual titles being as follows: abraded filament tyre cords; effect of heat setting on the physical properties of 'Terylene'; wave phenomena in tyres at high speed; and tread wear and fuel consumption of tyres.

An exhibition of instruments, selected principally to show some of the developments in rubber testing which have taken place since the last Conference, in 1948, was arranged in conjunction with the present Conference, there being seventy-six items, arranged in twelve groups. The organizations responsible for the development and manufacture of the instruments were indicated in the exhibition catalogue, and references to the literature were also given. In many cases, where appropriate, the instruments could be operated by turning a switch. The exhibition also contained a display of samples made from modified natural rubber, and a stand showing recent books dealing with rubber science and technology. Mr. B. J. A. Martin, who was responsible for the organization and arrangements of this exhibition, is to be highly commended for a most successful and interesting display. The proceedings of the Conference are to be published as a single volume, and the important task of collecting the many papers and discussions is in the capable hands of the editor-in-chief, Mr. T. H. Messenger. There is no doubt that this volume, when issued, will form a valuable record of the 1954 Rubber Technology Conference.

F. A. JONES

STANFORD RESEARCH INSTITUTE, CALIFORNIA

REPORT FOR 1953

THE report for 1953 of the Stanford Research Institute, California*, states that contract research at the Institute increased by 18 per cent to 6·5 million dollars, the percentage of government research declined from 61 per cent in the first quarter to 49 per cent at the end of the year, while industrial research projects increased by 7·9 per cent on 1952 and 78·5 per cent on 1951. Of the 382 projects carried on during the year, 234 were for commercial clients and 109 for government agencies, while 39 studies were initiated or continued by the Institute as part of its plan for aiding the technological development of the region. Some 9 per cent of the Institute's revenue during the past three years has been expended on international activities, while a 30 per cent expansion in staff brought the total to 674 at the end of the year, the increase in professional staff in 1953 being 126.

The present research programmes are in physical and biological sciences, engineering, economics, and certain applications of industrial psychology and sociology. Much effort in 1953 was directed towards the automatic assembly of equipment, control of processes and handling of large amounts of standardized data. Automatic processing and control were applied to a number of instruments, and a major programme was concerned with the development of improved machines and methods for the automatic fabrication of electronic equipment. A preliminary exploration of the possibility of constructing an input–output table for the flow of goods and services in the economy of the eleven western States of the United States was initiated, as well as a study of the impact of the aluminium industry on the economy of the Pacific North-West. A continuous process in which sawdust is held in fluidized suspension in a reactor is facilitating the preparation of chemicals from wood waste, while new lubricants for application at high temperatures have been developed experimentally and the physical properties of moulding resins were being correlated with structure to permit the preparation of new products with the desired combination of properties. A fundamental study of shock-wave behaviour in solid materials has led to a continuing programme on the application of the general laws of explosive shock waves to specific problems.

Another study is concerned with systematizing the use of selected common weeds as indicators of atmospheric pollution, while several field studies were concerned with the nature of the damage to commercial crops and vegetation by fluorides. A new instrument has been developed, utilizing a tape impregnated with a substance that loses its fluorescence on contact with gaseous fluorides, which gives an accurate record of atmospheric fluorides. Tracer techniques have made it possible to determine the contribution made by contaminants from a particular source to the total atmospheric contaminants in a given area. An extensive study of the requirements for airborne antennæ used in a long-range air-to-ground communications on military aircraft was completed during the year, while the Institute continued to participate in the applicatio of operational research techniques both in defenc problems and in industrial problems. Besides th development of new research techniques and instruments, the Institute has organized a techno-economi approach for assessing quickly the potential prospect of new products and markets.

CHEMICAL RESEARCH LABORATORY, TEDDINGTON

REPORT FOR 1953

THE report of the Chemistry Research Board signed by the chairman, Prof. E. L. Hirst, an the report of the director of the Chemical Researc Laboratory, Teddington, Dr. D. D. Pratt, compris the publication entitled "Chemistry Research 1953"*, which has recently appeared. To these are appende lists of committees of the Board, of staff of th Laboratory on December 31, 1953, of publication and patents in 1953, of metals held by the Pur Metals Committee, of standard substances availabl and of species in the National Collection of Industrial Bacteria. During the year the Chemistry Research Board endorsed a recommendation that chemical engineering should be added to the programme o the Laboratory, and, although such activities are a present planned on a modest scale, the Board point out that considerable additions to staff and accommodation will be required. The Board has also endorsed the recommendation of the Microbiolog Committee that the Laboratory should pursue it investigations on the microbiological production o sulphur using sewage sludge as source of carbo as far as laboratory large-scale experiments t provide data for pilot-plant operation, and experiments have also been made on the simultaneou production of carbon and methane, which shoul offer considerable savings in capital and operatin costs.

Commenting on the provision of standard material by the Laboratory, the director points out that since the National Collection of Industrial Bacteri was formed in 1950, 2,505 cultures have been distributed; and, of the 814 distributed in 1953, 53 were to research and educational and 279 to industrial establishments. Some effort is now bein devoted to research on the maintenance of thes cultures, particularly with reference to the viabilit of the organisms under freeze-drying conditions. Th Laboratory has now forty-one reference specimens o organic compounds available, including five adde during the year, and supplied 355 samples compare with 256 in 1952. The Board regards this work as most valuable contribution to the nation's scientif work. A stock of twenty-six pure metals is als maintained, and the Pure Metals Committee ha noted, as a result of scientific developments in th field of semi-conductors, a growing demand fo metals of a much higher degree of purity (99·999 pe cent). Among the advisory work of the Laborator the director's report specially mentions that o immersed corrosion, underground corrosion an atmospheric corrosion in which services have bee rendered to industrial firms and public bodies

Britain, the Middle East, South and East Africa and elsewhere. Samples of organic compounds have been analysed for some eighteen firms by infra-red spectrometry; in radiochemistry some twenty firms were assisted by the Radiochemical Group, and the Microbiology Group gave advice on problems connected with sulphate-reducing bacteria to many authorities including county and urban councils, stations of the Department of Scientific and Industrial Research and industry. The director's report notes that an increasing proportion of the time of the Corrosion of Metals Group is given to such extra-mural *ad hoc* problems. Apart from this, the Group has continued its study of the mechanism of corrosion inhibition, using mild steel immersed in potassium chromate solutions labelled with chromium. The capacitance method of evaluating the water uptake of paint films has been applied to coatings on nickel immersed in sea-water, and the test possesses advantages of speed, simplicity, continuity and non-destructiveness; but there appears to be no clear relation between the type of paint formulation and the degree of agreement with values obtained by the gravimetric method; for some paints and media agreement is close, whereas for others the values differed markedly. The Group is also investigating the corrosion of mild steel tubes in Scotch marine boilers; but its advisory work has limited its laboratory work largely to underground and microbiological corrosion and to examinations of corroded pipes, electrical power cables and soil samples, although it has been shown that mild oxidation increases the toxicity of commercially available tannins towards sulphate-reducing bacteria, and an explanation has been advanced of the formation of the geological deposits consisting of clay, sand or gravel cemented by iron oxides into a hard mass known as iron pan. An investigation of the oxidation of mild-steel sheet at 200° C. has thrown light on the mechanism of oxidation and on other phenomena at that temperature. Following further tests, the Becker-type condensation apparatus has been recommended to the parent committee of the Institute of Petroleum as a standard test for the evaluation of temporary protectives, and an apparatus embodying the same principle but capable of testing more and larger specimens has been designed at the request of the British Standards Institution.

The work of the Inorganic Group has been concentrated on the examination of waste and low-grade materials for the presence and recovery of valuable constituents and the preparation of elements and derivatives to a high degree of purity. The search for selenium in waste products continued, and, in view of difficulties experienced in obtaining consistent analytical results, much effort was given to securing analytical procedures more applicable to the variety of products and their wide range of selenium content. A method has been developed for the determination of small amounts of phosphorus in vanadium concentrates based on volatilization of the vanadium as vanadyl trichloride by heating at 420° C. in a slow stream of dry hydrogen chloride. Other work has been concerned with the recovery of sulphur from low-grade sulphur ores and of copper from flash-roasted pyrites cinders, while concentration studies have related to the behaviour of gold and other metals in adsorption and elution from 'Amberlite IRA 400', the behaviour of molybdate, chromate, vanadate, arsenate and tungstate with basic resins and the evaluation of new ion-exchange resins for separating metals. A chromatographic separation process for niobium, tantalum, copper, cobalt, uranium and lead in soils, for use in the field, the operation being completed in less than thirty minutes, has been designed, and the partition of thorium nitrate between ether and water at varying concentrations of thorium nitrate and nitric acid has been determined. A scintillation counter for use with carbon compounds containing carbon-14 has been completed and tested, as well as an apparatus for testing the behaviour of ion-exchange resins under repeated treatment with a series of solutions.

In the Organic Chemistry Group vapour-pressure and boiling-point measurements on phenol have nearly been completed, and the densities at 20° C. and 30° C. of pyridine and of four of its homologues have been determined, as well as the refractive indices of fourteen mixtures of pyridine and water, thus permitting the analysis of such mixtures with high precision from refractive index measurements. This system has also been re-examined over the whole range of concentrations with a vapour–liquid equilibrium still, operated isothermally, at 70° C. and at 90° C. Results of a combined investigation with the National Physical Laboratory of the construction, use and long-term behaviour of triple-point water cells indicate that the triple point of water is reproducible to 0·0001 deg. C. and that the triple-point cells do not deteriorate even after several years of use. Preparative work has been concerned mainly with carboxylation by means of carbon dioxide, particularly of phenols and of epoxides; the preparation and applications of isotopically labelled carbon compounds; and the exploration of new ion-exchange resins containing chelating groups. Under the first, a brief study of 4-hydroxy*iso*phthalic acid has indicated a tendency for the carboxyl group to be eliminated in substitution reactions, and high yields of ethylene carbonate have been obtained from carbon dioxide and ethylene oxide under pressure in the presence of catalysts. Sulphur dioxide similarly yielded a linear polymeric sulphate, depolymerized to the cyclic monomer on heating, while ethylene oxide and phosgene give by exothermal reaction, first, β-chloroethyl chloroformate, which with more ethylene oxide yields di-β-chloroethyl carbonate. Work continued on the preparation of resins containing complex-forming functional groups, from formaldehyde and resorcinol derivatives, while the Arbuzov reaction has been used to prepare ion-exchange resins containing the phosphonic acid group. The randomization of carbon-14 in methylcyclohexane has been developed into a useful method for the synthesis of labelled aromatic compounds, and the technique of filling ampoules with gases or liquids has been developed and a Podbielniak fractional distillation unit installed.

The High Polymers Group concentrated its effort on ion-exchange and allied properties of cross-linked polymers and semi-permeable membranes, and their applications. A detailed study of the relative affinities of alkali metal cations for sulphonated polystyrenes of different cross-linking has been completed, but no further work on strongly acidic cation-exchangers is proposed. By chloromethylation of styrene – divinylbenzene copolymers and subsequent animation in dioxan, methyl ethyl ketone or benzene, a range of anion-exchange resins has been prepared the properties of which may be systematically varied with respect to functional group, degree of cross-linking and ion-exchange capacity. Work has also continued on resins containing chelating groups, and a study of factors determining the semi-permeability of poly (vinyl alcohol) films in non-aqueous systems has shown that membranes of low permeability can be used to determine the molecular weights of simple compounds of known structure; work on the development of membranes for use in aqueous systems has commenced.

Besides the work already noted, the Microbiology Group continued its fundamental studies of sulphate-reducing bacteria, particularly their metabolism, and the continuous process for bacterial sulphate reduction, and started some studies of the bacterial oxidation of aromatic compounds, particularly the microbiological breakdown of phthalate, a process of industrial importance in the disposal of effluents.

THE ICE AGES AND PAST VARIATIONS OF THE EARTH'S CLIMATE

During the past sixteen years, Dr. E. J. Öpik has written extensively on climatic changes in a number of publications, and in Contribution No. 9 of Armagh Observatory, entitled "A Climatological and Astronomical Interpretation of the Ice Ages and of the Past Variations of Terrestrial Climate"*, he has written a paper which largely embodies the main points in his studies.

As might be expected, Dr. Öpik rejects the old astronomical theories of the fluctuations of climate—the changes in the obliquity of the ecliptic and the eccentricity of the earth's orbit. About half a century ago these were shown to be utterly inadequate to account for glaciations and warm interglacial climates, but from time to time they have been revived. Simpson's theory of the ice ages, which was advocated a quarter of a century ago—that they are caused primarily by an increase in solar radiation which in turn leads to a rise of the mean global temperature and an increase of the absolute moisture content of the atmosphere, followed by more precipitation in the form of snow in the polar regions and an advance of glaciers—is dismissed with very little criticism. It is pointed out that there is an absurdity in the theory which postulates the melting of the glaciers and the retreat of the ice when the greater heat takes control, because both the advance and the retreat of the glaciers are explained by the same cause. In addition, climatological and other evidence points to the conclusion that the glaciers of Greenland retreated during the past century, in close response to the increased global temperature.

Dr. Öpik maintains that an interpretation of climatic changes cannot be made without a clear quantitative understanding of the heat balance of the earth, and he develops a method of quantitative analysis of the climatic heat balance, based on the equation $Q = I + E$. In this, Q, I and E represent respectively the net radiation to space, the net insolation or the absorbed solar radiation, and the heat supplied by other sources; the last-named includes convective interchanges with other parts of the earth's surface, such as atmospheric and oceanic currents, or released from that stored in the soil, the water or the atmosphere. On this basis and with certain further assumptions, standard mean radiation curves, in dependence on the mean surface temperature, are calculated for summer and winter as well as for clear and cloudy sky, and the results are given in the paper. Two sections, comprising twenty pages, are devoted to "Variations of Solar Luminosity" and "The Mechanism of Solar Long-Term Variability" and contain references to Öpik's work on these problems during the past fifteen years or more. Regarding the latter section, it appears that a temporary increase of the energy production near the sun's centre will lead to a decrease of solar radiation and to an ice age if the decrease is deep enough. A qualitative picture is sketched of the way in which repeated disturbances in the interior of a dwarf star like the sun can be produced, and it is just possible that here may be an explanation of the mechanism by which major ice ages were recurrent phenomena of a periodicity of about 240 million years. Of course, there is necessarily a considerable amount of speculation in all this, and it is very difficult to make many definite deductions in such matters.

Towards the end of the paper, under "The Problems of Pre-Tertiary Climate", Dr. Öpik confirms his views expressed in 1938 that, although Wegner's theory of continental drift, postulating a corresponding displacement in latitude, cannot explain the last ice age, nevertheless there can be little doubt about the reality of large-scale horizontal displacements (Alpine foldings) in the earth's crust. The opinion is expressed that even if the strange phenomena of Carbo-Permian glaciation can be partly explained by continental drift (and this glaciation is an inducement to regard Wegner's theory favourably), this explanation completely fails for the earlier Cambrian glaciation.

WINCHESTER COLLEGE NATURAL HISTORY SOCIETY

It is regrettable that the reports of the Winchester College Natural History Society can be published only once every three years owing to increased costs of printing, etc., for the report before us (1950–53) is well produced and makes very encouraging reading. However, duplicated summaries of observations on birds, insects and plants are issued every year.

The Society itself is very active, and the report reveals a variety of interests from general field observations to more specialized studies. Three specialized sections of the Society have now been formed—birds, insects and plants—and others may follow.

The report opens with an account by the warden, J. A. L. Myres, of the Viscount Grey Nature Reserve, "Fallodon", which is a part of Watermeads, a piece of land belonging to the College. It is quite clear that enthusiastic boys of the College have done much to render this nature reserve a really valuable asset since the War, during which its upkeep proved impossible.

P. J. Chadder gives an excellent account of the birds' nests (fifteen nests of seven different species) he examined in Fallodon during 1953. This is followed by a numerical analysis of the seasonal changes in birds in that reserve by D. E. D. Campbell.

He concluded that the number of birds were the same in summer as in winter, but that there were considerable decreases during early spring and autumn. The population also varied from week to week during the winter, but was constant during the summer. H. E. Norton publishes a commendable study of the territorial life of the blackbird—a long paper accompanied by six maps. He also presents the bird records for September 1949–July 1953. The bird-ringing report is made by J. A. L. Myres. Interest in birds is also enhanced in this report by a short account of the birds of Australia by J. E. Mollison.

A record of butterflies and moths around Winchester during 1950–53 is given by P. O'B. Harris. W. H. Dowdeswell describes the numerous visits made to Fisher's Pond, a pond which is proving ideal for the study of freshwater life. Molluscs, arthropods and birds were the main subjects of investigation. Another long paper is contributed by R. G. Borneman, writing on the movements and changes in a freshwater plankton community. This is accompanied by two figures and a table of results. Botanical activities are recorded by J. B. Poynton.

During the season reported about forty lectures and film exhibitions were arranged.

This report is one of several which reveal the active interest shown in some schools in field natural history where young students are able to make first-hand studies in ecology, taxonomy, behaviour, etc. Winchester College, with some of our more enthusiastic schools, is leading the way in a fuller appreciation of the true import and value of biological studies.

FORESTRY IN NEW ZEALAND

THE critical position of the indigenous forests of New Zealand has been known for some years and discussed in the annual reports of the Director of Forestry, New Zealand Forest Service. The annual report for the year April 1952–March 1953 (pp. 80. Wellington: New Zealand Forest Service, 1953) deals at some length in its opening pages with this question in its relation to the large area of exotic softwood coniferous forests now existing in the Islands. The position appears to be whether to sanction cutting out in a comparatively few years the remaining existing indigenous forest to maintain the saw-mill industry and industries dependent on indigenous timber and other vested interests, or to reduce the cut so as to maintain a portion at least of the natural forest of the Islands. The Forest Service correctly advocates the latter policy; but there appears to be a considerable body of public opinion against it.

New Zealand is not the only country in the world faced with this question in varying aspects, not excluding Great Britain. The time would appear to be approaching, if indeed it has not been already reached, when the world as a whole will have to make up its mind so far as forestry is concerned (which, in fact, is Nature herself) whether the forest soils of any country capable of maintaining its indigenous forest and species of trees should not rigidly be confined to this purpose; fast-growing exotics showing quick financial returns would then only be used when obviously useful or to fill a temporary gap in supplies, due to past mismanagement by man of the natural forests.

In New Zealand, as the report says, "The exotic forests were established to conserve the indigenous forests; therefore it is putting the cart before the horse to suggest that the Forest Service is seeking a ready sale for exotics by curtailing the cutting of native timber. It would be more correct to say that the production of exotics has been expanded in order to make it possible to reduce the sale of indigenous timber. . . . Experience has shown in foreign countries . . . that exotic species have definite limitations and for this reason the national policy must envisage the management of the indigenous forest to secure their maximum favourable production of timber". To this might have been added their management by the Forest Service in perpetuity, since there can be no question that this is the correct forest and economic policy for the indigenous forests.

NEW OBSERVATIONS ON THE CHEMISTRY OF N-CARBOXY-ALPHA-AMINO-ACID ANHYDRIDES

By D. G. H. BALLARD, DR. C. H. BAMFORD
AND
DR. F. J. WEYMOUTH
Research Laboratory, Courtaulds, Ltd., Maidenhead, Berks.

THE polymerization of N-carboxy-α-amino-acid anhydrides initiated by primary and secondary bases has been studied in some detail, and the main features of the chemistry of the reactions occurring are fairly well understood[1]. In these cases the main products are linear polypeptides. When primary or secondary base initiation has not been used, other products have occasionally been observed, including cyclic peptides and substituted derivatives of hydantoin 3-acetic acid[2,3]. The exact experimental conditions favouring the formation of these substances are not established in the literature, and no detailed mechanism of the reactions has been put forward. We have recently investigated the behaviour of a number of N-carboxy-α-amino-acid anhydrides in highly polar organic media, and have observed some interesting phenomena which lead to a clearer understanding of the general chemistry of these compounds. Our main observations, on the effects produced by the addition of inorganic salts and tertiary bases, are summarized here.

Catalysis by Inorganic Salts

Many N-carboxy-α-amino-acid anhydrides are stable, or react only slowly when dissolved in highly polar organic liquids such as NN-dimethylformamide or NN-dimethylacetamide. Addition of a soluble anhydrous inorganic salt, however, has been found to produce a rapid reaction. Fig. 1 shows typical results with glycine, C-phenyl glycine and DL-phenylalanine N-carbonic anhydrides in NN-dimethylformamide. In the case of C-phenyl glycine N-carbonic anhydride there was no detectable reaction before the addition of lithium chloride; after addition, rapid evolution of carbon dioxide occurred. Glycine and DL-phenylalanine N-carbonic anhydrides gave

measurable reaction-rates in the absence of salts, but these were accelerated by factors up to 200 on addition of lithium chloride or sodium iodide.

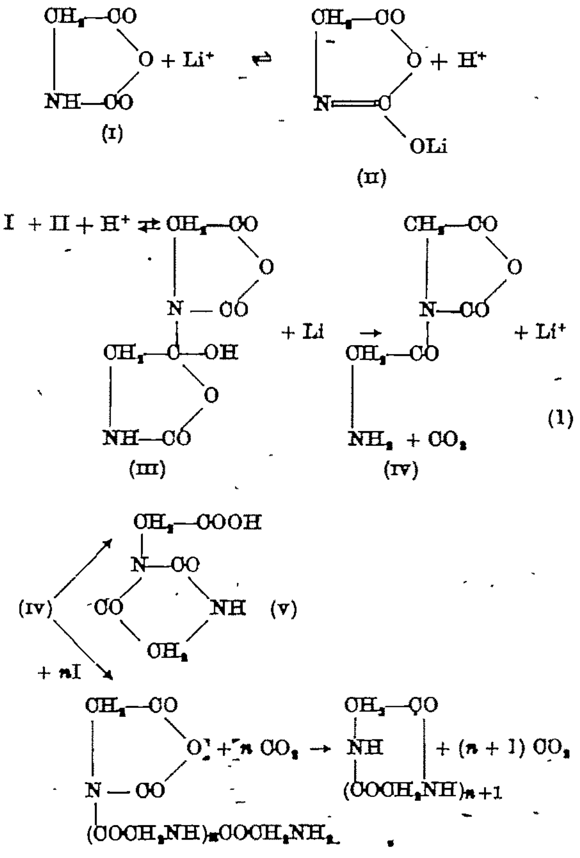
Examination of the liquids after reaction revealed that the main products are cyclic polypeptides and derivatives of hydantoin 3-acetic acid corresponding to the anhydride used. Table 1 gives representative results for the yields of the hydantoin derivatives; the remainder of the anhydride forms mainly cyclic peptides. No 2 : 5-diketopiperazines have been identified. With glycine, the hydantoin 3-acetic acid (V) was estimated colorimetrically with alkaline picric acid and by titration, the two methods giving concordant results. For the other anhydrides the results given are based on titration results only, and would therefore include other compounds containing —COOH, for example, carboxyl-terminated polymers containing ureido groups. As may be seen from Table 1, the yield of the hydantoin derivative may be considerable.

A brief study of the main kinetic features of the lithium chloride catalysed reactions of glycine N-carbonic anhydride has been made. The initial rate of reaction is not affected significantly by the presence of water, and does not depend upon the method adopted for purifying the salt. Acids have a strong inhibitory effect on the reaction, this being particularly marked at the lower salt concentrations. A trace of acid present initially produces an induction period. The hydantoin 3-acetic acid produced is a comparatively strong acid ($pK_a \sim 3$), so that the reaction is self-inhibiting at quite small conversions. At salt concentrations greater than 0·1 *N* the rate shows second-order dependence on monomer concentration, and is independent of the concentration of lithium chloride. The rate falls off with decreasing concentration of lithium chloride below about 0·1 *N*.

Table 1. SALT-CATALYSED REACTIONS IN NN-DIMETHYLFORMAMIDE SOLUTION

N-Carbonic anhydride of	Initial concentration (mol l.$^{-1}$)	Salt concentration (mol.l $^{-1}$)	T °C	Per cent of anhydride converted to hydantoin 3-acetic acid
Glycine	0·53	$1·6 \times 10^{-2}$ (LiCl)	27	7·6
,,	0·17		27	11·2
,,	0·52	$1·6 \times 10^{-2}$ (LiCl)	27	10·2
,,	0·08		27	17·4
,,	0·6	2·5 (LiCl)	50	20
,,	1·0	0·8 (NaI)	50	30
C-Phenyl glycine	1·0	2·5 (LiCl)	50	40
DL-Phenylalanine	1·0	,,	50	17

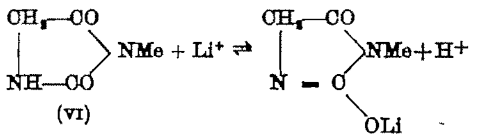
The catalytic effect of salts is apparently connected with the presence of an —NH— group in the N-carbonic anhydride molecule. N-methyl glycine N-carbonic anhydride (sarcosine N-carbonic anhydride) does not react when dissolved in NN-dimethyl-formamide–lithium chloride mixtures, but a rapid reaction ensues if 3-methyl hydantoin (VI) is added. This latter substance has structural similarities with glycine N-carbonic anhydride and probably interacts with lithium salts in an analogous manner. The products of this reaction are then



capable of initiating the polymerization of the sarcosine N-carbonic anhydride. The overall reaction yields polypeptides with basic groups, which titrate like those in linear polysarcosines. This reaction, like that of the glycine N-carbonic anhydride, is powerfully inhibited by traces of acids.

We consider that the catalytic effect of salts such as lithium chloride is to be attributed to complex formation between the anhydride, or hydantoin, and the cation, resulting in the displacement of a proton and the formation of a molecule in which the nitrogen atom has basic properties sufficient to allow reaction with N-carboxy-α-amino-acid anhydrides. Thus the reactions with glycine N-carbonic anhydride (I) may be envisaged as shown in scheme (1).

These reactions may be shown to be consistent with the kinetic observations. An important feature of the mechanism is that the formation of hydantoin 3-acetic acid and cyclic polyglycine from (IV) is accomplished without postulating improbable cyclizations. A study of models of (IV) shows that production of 2 : 5-diketopiperazine by direct cyclization is most unlikely and, as we have already mentioned, this compound does not seem to be formed. The primary reactions of sarcosine N-carbonic anhydride in the presence of lithium chloride and 3-methyl hydantoin are probably similar, the first step, (2), being followed by formation of compounds analogous to (III) and (IV):



(VI) (2)

It is interesting to note that a cyclic structure is necessary for initiation of this kind; the open-chain analogue of (VI)—acetyl *sym*-dimethyl urea—is ineffective.

Since the reaction-rate is independent of the concentration of lithium chloride, the exact nature of the ionic species reacting with the N-carbonic anhydride is uncertain; this may be an ion pair such as Li^+Cl^- or a partly or wholly solvated cation.

Catalysis by Tertiary Bases

N-carboxy-α-amino-acid anhydrides which are not N-substituted appear to react readily in the presence of tertiary bases, particularly in polar media. Again, the products contain considerable amounts of hydantoin 3-acetic acid derivatives, as shown in Table 2.

Table 2. REACTIONS CATALYSED BY TERTIARY BASES. 27° C.

N-Carbonic anhydride of	Solvent	Per cent anhydride converted to hydantoin 3-acetic acid derivative
Glycine	NN-Dimethylformamide	60
,,	Nitrobenzene	8
,,	Acetonitrile	28
* ,,	Pyridine	2
* ,,	NN-Dimethylformamide + 10 % pyridine	40
C-Phenyl glycine	NN-Dimethylformamide	17
DL-Leucine	,,	25
DL-Phenylalanine	,,	16

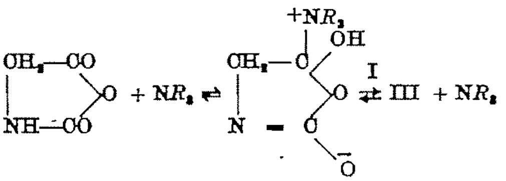
Initial concentration of the anhydride was 0 2 *M*; the initiator was triethylamine in concentration 0 008 *M*, except where marked *, when no triethylamine was added

The only other major products are cyclic peptides, which in the case of glycine N-carbonic anhydride have been isolated in crystalline form. Of these, cyclic hexaglycine predominates. No 2 : 5-diketopiperazine has been detected.

The relative yields of hydantoin derivative and cyclic peptide clearly depend on the nature of the solvent. One important factor is the polarity of the latter, as shown by a comparison of the two experiments with pyridine given in Table 2. A high polarity favours hydantoin formation; but the results with dimethylformamide and nitrobenzene show that other factors are also involved.

No reaction has been observed in any solvent between pure sarcosine N-carbonic anhydride and tertiary bases. This is in sharp contrast to the results obtained by Wessely and co-workers[3]; we have been unable to confirm the claims made by these authors that N-substituted N-carboxy-α-amino-acid anhydrides react readily in pure pyridine.

The results obtained with tertiary bases obviously resemble those with lithium salts in polar media, and a corresponding mechanism may be postulated. For example, equilibria such as those shown in (3) may exist, leading to reactions analogous to those in (1):



(3)

Essentially similar mechanisms leading to the intermediate formation of the dimer (III) may be proposed for the spontaneous decomposition of N-carboxy-α-amino-acid anhydrides in polar organic solvents. (The formation of high polymers in non-polar solvents probably results from initiation by traces of water or other impurities.) We have observed that the presence of traces of water leads to an increase in the proportion of hydantoin 3-acetic acid formed during the decomposition of the glycine N-carbonic anhydride in dimethylformamide. With larger amounts of water, however, hydantoin formation decreases until in pure water or in aqueous lithium bromide solution no hydantoin-3-acetic acid is formed. Thus in the presence of high concentrations of water, normal initiation by the latter appears to predominate. Parallel results are obtained with the lower aliphatic alcohols, hydantoin 3-acetic acid when formed appearing as the free acid and not as the ester. This latter observation is consistent with our mechanism for the spontaneous decomposition of the N-carboxy-α-amino-acid anhydrides, which is probably operative under these conditions.

To summarize, we consider that the nitrogen atom of an N-carboxy-α-amino-acid anhydride may in some circumstances assume basic properties without rupture of the heterocyclic ring. This leads to a variety of reactions which are of predominant importance in highly polar media, and which may also account for the minor products observed under different conditions by other workers. Radio Observations of Ionized Hydrogen Nebulæ and Other Discrete Sources at a Wave-length of 9·4 cm.

In recent attempts[1-3] to account for the general radio emission from the Galaxy as the integrated radiation of discrete galactic radio sources, it was found necessary to introduce the effect of ionized interstellar hydrogen, H II regions, to fit the observed radio isophotes at various frequencies. Scheuer and Ryle[4] detected, at wave-lengths of 1·4 and 3·7 m., a bright band of emission confined within 2° of the galactic equator superimposed on the general radiation. They identified the bright band with thermal emission from a distribution of H II regions. H II regions are strongly concentrated in the galactic plane. The large source, Cygnus X, has been tentatively described as thermal emission[5], perhaps from several bright H II regions surrounding γ Cygni[5], or from the integrated radiation of all the H II regions in the spiral arm in the direction of Cygnus[3]. However, Baldwin[6] attempted unsuccessfully to detect, at a wave-length of 1·4 m., a very bright individual H II region, the Orion nebula. Observations of discrete sources have been almost entirely confined to metre wave-lengths, where spectra of more than twenty sources have been obtained[7]. Piddington and Minnett[5,8] observed five discrete sources at a wave-length of 25 cm. and the emission at 25 and 10 cm. from a region near the galactic centre. This was an appreciable extension of the short-wave limit of source spectra.

We recently reported[9] the further extension, to a wave-length of 9·4 cm., of the spectra of six well-known sources and the detection of four bright galactic nebulæ: the Orion, Omega, Trifid and Lagoon nebulæ, bright individual H II regions. Diffuse nebulæ had not been previously identified as radio sources. Evidence was given for the thermal origin of the observed radiation from the Orion nebula, thereby supporting the assumption of thermal emission from a distribution of H II regions. Recen measurements[10] at a wave-length of 21 cm. by Hagen, McClain and Hepburn have been made on the Orion nebula and several other H II regions. The Orion nebula flux density was, as predicted by the therma model, the same as that observed at a wave-length of 9·4 cm.

This communication reports a second survey a wave-length 9·4 cm. undertaken during March 10–18 1954, principally of known H II regions[11]. The 50-ft diameter paraboloidal reflector[12] and microwav radiometer was again employed. The antenna bean was 0·45° × 0·40° between half-intensity points Table 1 summarizes preliminary results of both surveys. The estimated accuracy of the antenna temperature, T_A, is 2° K. and of the flux density 25 per cent. The brightness temperature of a source averaged over the beam equals 1·7 T_A. The position of sources are estimated to be accurate to 0·2 min in R.A. and 5′ in Dec. for the first eight sources an to 1 min. in R.A. and 15 in Dec. for the remainder except for the large sources which subtend about 2 (Nos. 9, 16, 21 and 24). The N.G.C. number give the New General Catalogue, or Index Catalogue number of the celestial object previously identified with or suggested here as the radio source. Messie objects are also numbered.

Sources Nos. 1–11 were detected in the first survey and were mentioned above. Source No. 5 lies in the direction of the galactic centre (galactic longitude 327·6°, latitude −1·46°). Further measurements o Nos. 10 and 11 give revised values for T_A an indicate that they are discrete sources, perhaps superimposed on radiation from the galactic plane Source No. 12 also appears to be superimposed upo radiation from the galactic plane. No. 24 wa obtained from a drift of the galactic plane through the antenna beam. These findings indicate that a narrow band of galactic radiation at wave-length 9·4 cm. extends at least 10° along the galactic plane through the galactic centre (No. 9) where it i brightest. This may be identified with the brigh

band observed at metre wave-lengths mentioned earlier.

Eleven additional H II. regions (Nos. 12–21 and 23) were detected during the second survey. Eight of these (Nos. 12, 13, 15, 18–21 and 23) appear to have been previously undetected at radio wave-lengths. The intensity of the Cygnus X source at wave-length 9·4 cm. agrees with the thermal-type emission spectrum found at longer wave-lengths[9]. No. 22 is a non-thermal source recently detected at metre wave-lengths and identified with the rare type of nebulosity similar to the double-loop nebula in Cygnus[13].

This work will be described in more detail elsewhere.

Ferromagnetic Resonance in Ferrites

FERROMAGNETIC resonance studies have been made on polycrystalline specimens of the ferromagnetic systems $(1-x)(\mathrm{LiFe_5O_8})x(\mathrm{CdFe_2O_4})$, $\mathrm{Li(Fe_{1-x}Al_x)_5O_8}$, $\mathrm{Ni_{1-x}Zn_xFe_2O_4}$ placed in resonant cavities operating at frequencies of 9,470, 23,940 and 34,400 Mc./sec.

The component oxides were mixed and pre-fired at 200 deg. below the final sintering temperature for 7 hr. The product was re-ground, pressed at 45 tons per square inch and sintered in air for 40 hr. at a temperature of 1,000° C. for the lithium–cadmium ferrites and 1,400° C. for the others. The furnace was then switched off and allowed to cool. Specimen densities of 90–97 per cent X-ray density were obtained. Spherical specimens produced in a device similar to that described by Bond[1] and ranging in diameter from 0·20 mm. to 1·40 mm. were mounted on a fine glass support which could be moved along the axis of a microwave cavity formed from a rectangular wave-guide. The strength of the externally applied magnetic field necessary to induce peak resonance loss, H_{res}, and the resonance line-width were studied as functions of frequency, specimen size, and position of the specimen along the cavity axis. The frequency/resonance field value for each resonance was determined by comparison with the ratio for the substance α-α-phenyl β-picryl hydrazyl, for which $g = 2{\cdot}0037 \pm 0{\cdot}0002$[2]. These studies have yielded the following information.

(1) The placing of a specimen directly on the cavity end wall increases the value of H_{res} below that necessary when the specimen is located at a magnetic antinode away from the cavity walls by an amount of the order of $\frac{1}{3}M_s$, where M_s is the saturation magnetization per unit volume of the specimen material. The wall effect may be considered to be due to the presence of a magnetic dipole induced in the end wall and is insensitive to variations in both frequency and specimen size. Resonance line-widths are not significantly affected.

(2) Measurements on specimens located at the first magnetic antinode from the end wall have shown that, before the onset of skin effects[3], the value of H_{res} varies with specimen size according to the law

$$H_{(\omega,\,r)} = H_{(\omega,\,0)} + h_0\,(r/\lambda_i)^2,$$

where r is the radius of the specimen, λ_i is the effective internal wave-length for propagation in the material at an angular frequency ω, and h_0 is a constant. It is believed that the concentration of the oscillatory field along the axis of a specimen produces an effective shape of specimen deviating progressively with increasing radius from that of a sphere. The recognition of this relationship improves the extrapolation of resonance fields to zero radius of specimen.

(3) The extrapolated values of $H_{(\omega,\,0)}$ have been found to fit, to within the experimental error of ± 10 Oe. at 9,470 Mc./sec., ± 20 Oe. at 23,940 Mc./sec. and ± 30 Oe. at 34,400 Mc./sec., a resonance relationship of the form reported by Okamura *et al.*[4], namely:

$$\omega = \frac{ge}{2mc}\,(H + H_i),$$

and yield the values for g and H_i given in Fig. 1 and Table 1. Magnetization measurements (unpublished) have shown that the cadmium ions in lithium cadmium ferrites enter tetrahedral sites, while the aluminium ions in lithium ferrite-aluminates for the most part enter octahedral sites leading to an anti-ferromagnetic structure for about 35 per cent aluminium replacement. The measured values of g tend to rise as this composition is approached, and the interpretation of this factor as the spectroscopic splitting factor, having regard to ferrite-sub-lattice effects[5], leads to the conclusion that the value of g for a ferric ion depends on the particular lattice site which it occupies. For lithium ferrite, the values of g for ferric ions on either tetrahedral or octahedral sites must be at least 0·03 less than that for the spin

Table 1. VALUES OF g AND H_i DERIVED FROM RESONANCE MEASUREMENTS ON POLYCRYSTALLINE SPECIMENS

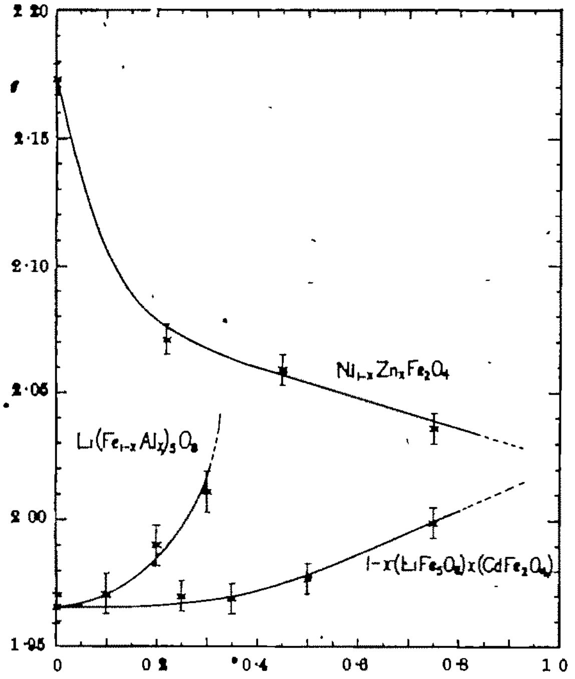

Fig. 1. Variation with ferrite composition of the g-factor derived from the resonance relationship $\omega = ge(H + H_i)/2mc$

only, namely, 2·00. Further consideration of the values for the cadmium- and zinc-substituted systems indicates that the effective values of g may also depend on the nature of the surrounding ions.

The treatment of a polycrystalline specimen as an aggregate of spherical non-interacting, randomly oriented crystallites shows that magneto-crystalline anisotropy may give rise to an effective field of the order of $-0\cdot2\ K_1/M_s$, where K_1 is the first-order anisotropy constant, assumed negative. Measurements on single crystals (unpublished) have given the values of this factor for three nickel–zinc ferrites and these are seen from the table to account for not more than a third of the field H_i.

(4) Resonance measurements at high levels of microwave power have shown a behaviour similar to that observed[6] in other ferrite systems. The resonance peak is reduced to half the low-field value for microwave field-strengths of the order of 10–100 Oe. when specimens absorb energy at rates of the order of 10^{12} ergs/c.c./sec. The resonance line-width does not appear to be a measure of the relaxation time associated with the interchange of energy between the absorbing mechanism and its surroundings, but may be considered as setting a lower limit to this time. If the concept of spin-wave excitation is used, the spin-wave states available for excitation must extend into the spin wave-number range of 10^6–10^7 cm.$^{-1}$, in which range a considerable contribution to the energy of excitation is normally to be expected from exchange effects. It is nevertheless possible that the resonance absorption proceeds by the induction of transitions between spin-wave states of this order of wave number, which at ordinary temperature would be the only ones vacant and therefore able to be excited. The formation of two spin waves of wave numbers $\bar{l}$ and $\bar{m}$ from one of wave number $\bar{k}$ in a cubic matrix with lattice constant a of ions of spin S and exchange integral J would require the energy:

$$\hbar\omega = \Delta E = \hbar\gamma H + 2SJa^2 (l^2 + m^2 - k^2),$$

with $\bar{k} = \bar{l} + \bar{m}$. This expression is of the form $\omega = \gamma(H + H_i)$, where:

$$H_i = 2SJa^2 (l^2 + m^2 - k^2)/\hbar\gamma.$$

Values of k, l and m, all of the order of 10^6–10^7 cm.$^{-1}$, may be chosen to yield values of H_i consistent with experiment. On this interpretation the resonance line-width would then be determined in part by the distribution of transition probabilities for various values of H_i.

This work will be discussed in more detail in a later publication.

The materials used in this investigation were prepared by Dr. A. E. Carter, Messrs. P. E. Gallant and W. C. Greenstreet under the direction of Dr. A. J. E. Welch, in the Chemistry Department, Royal College of Science, London. I wish to thank Dr. Willis Jackson, at whose instigation this work was begun, for his interest and encouragement throughout its course.

The work described above was carried out as part of the programme of the Radio Research Board, and this communication is published by permission of the Director of Radio Research, Department of Scientific and Industrial Research.

Use of X-Ray Film for comparing Radioactivities

ALTHOUGH the initial discovery of radioactivity resulted from its action on a photographic plate, electronic instruments have to-day become accepted as the first choice for detecting, and more particularly for measuring, radioactivity. It has, however, been shown that photographic emulsions can, with suitable methods for internal calibration, be used for giving reasonably accurate comparisons of radioactivity[1]. The present communication is concerned with a direct comparison of the accuracy obtained with a counter and with X-ray film, when used for comparing the radiation per unit area from a number of different sources. These were prepared by converting images from a photographic step-wedge quantitatively into silver iodide in the presence of iodine-131[2]. The relative quantities of silver, and hence of radioactivity, in the sources were compared: (*a*) by direct chemical analysis; (*b*) by a Geiger–Müller counter using a count of at least ten thousand for each specimen; (*c*) by making a series of autoradiographs with accurately determined exposure times and deriving the relative activity of each source from plots of density against log-exposure time; (*d*) by using visual density matching to determine (from the same autoradiographs) the exposure time needed by

Table 1.

Relative silver masses determined by chemical analysis	Relative radioactivities (and hence silver masses) determined by: Geiger counter	Autoradiography and density measurement	Autoradiography and visual estimation: Observer 1	Observer 2
16·1	13·9	15·1	17	17
38·6	37·0	39·5	42	35
58·8	58·7	59·4	59	52
77·5	76·3	77·8	79	70
91·3	92·2	93·3	91	79
100	100	100	100	100

ach source to give a standard (but not measured) lensity. The quantities in the weaker sources were hen expressed as percentages of the strongest source.

Table 1 shows that method (c) gave an accuracy omparable with that obtained by counting, while ven without a densitometer accuracy adequate for emi-quantitative work was achieved.

Apart from its obvious usefulness in laboratories ot equipped with a counter, autoradiography has ertain other advantages: in its simplest form it equires no special equipment; it produces a permanent record of relative activities; in the sense that ne sheet of film can be simultaneously exposed to a arge number of specimens, it is equivalent to the use f a whole battery of counters, and as a result, autoadiography can simplify, or make unnecessary, orrections for decay. It also facilitates more accurate ssessment of isotopes having short half-lives, and akes practicable comparisons of very weak sources vhich would each require a long time on a counter.

A full account of this work is being prepared for ublication elsewhere.

Bond-Lengths and Force Constants for Methane, Silane and Germane

In a recent paper by one of us (N. H. M.[1]), a etailed discussion of the electron distributions and otential fields for molecules of high symmetry was iven on the basis of the Thomas–Fermi theory. In his work the nuclei of the outer atoms were smeared ut over the surface of a sphere and the electrons hen regarded as moving in the resulting spherically ymmetrical field. A general discussion of the energy vas also given, and the existence of a minimum in the nergy curves was demonstrated. However, the heoretical bond-lengths were in poor agreement with he experimental values, and it was suggested that his might be due to the neglect of exchange.

We have now considered in detail the effect of xchange on the energy curves for methane (CH_4), ilane (SiH_4) and germane (GeH_4), for which moleules the smoothing approximation referred to above eems physically very reasonable. The Thomas–ermi electron densities obtained previously have een used as variation functions for calculating the nergy including exchange, this being analogous to the procedure introduced by Scott[2] in his successful calculation of binding-energies for atoms. We are thus enabled to calculate the bond-lengths and the force constants for the totally symmetric vibrations of these three molecules, and the results are recorded in Table 1. For comparison, we also give the bond-length for methane when exchange is ignored[1] (the bond-lengths for silane and germane will be somewhat greater than this), together with an approximate value for the force constant for methane obtained by using the formula of Bowers[3] slightly outside its proper range of validity.

Table 1

Bond-lengths (in A.)

	Experimental	Thomas–Fermi	Thomas–Fermi with exchange
CH_4	1·09	2·1	1·38
SiH_4	1·46	—	1·62
GeH_4	1·48	—	1·9

Force constants (in units of 10^5 dynes/cm.)

	Experimental	Thomas–Fermi	Thomas–Fermi with exchange
CH_4	20	1	9
SiH_4	11	—	5
GeH_4	10	—	3

It can be seen that the bond-lengths are improved considerably by the inclusion of exchange, the errors in the calculated bond-lengths for methane and silane being 27 and 11 per cent respectively. However, for germane the error increases again to about 25 per cent, which at first sight seems surprising in view of the fact that the Thomas–Fermi method should become more reliable as the number of electrons increases. Heath, Linnett and Wheatley[4], however, have concluded previously from a study of regularities in bond-lengths and force constants for a number of molecules that the bond in germane is probably "abnormally strong and short". If this is so, then it is not very reasonable to expect the Thomas–Fermi method, which distinguishes different atoms only by virtue of a change of scale depending on their atomic numbers, to be able to deal accurately with such a case. It is not so surprising, therefore, that by this method we find a larger deviation from the observed value for germane than in the case of silane.

As one would expect, the force constants are less satisfactory than the bond-lengths. Again, however, it is clear that exchange has a marked effect, the force constant for methane being improved by a factor of 9.

What has emerged from our calculations is that the exchange energy plays an essential part in determining bond-lengths and force constants from the present theory. Considering the simplified nature of the treatment, agreement with experiment is very reasonable. There is, however, some indication that the model we are using is least satisfactory for germane, in which the bonding is rather 'abnormal'. We are now investigating the application of the method to other molecules, and a detailed account of the work will be published later.

Some 2 : 4-Diaminopteridines as Folinic Acid Antagonists

Burchenal and his colleagues have reported that 4-amino-10-methylpteroylglutamic acid (amethopterin) prolongs the lives of mice implanted experimentally with leukæmia[1], and that folinic acid antagonizes this therapeutic effect more potently than does pteroylglutamic acid[2]. Accepting the view that the antifolinic acid activity of amethopterin is related to its therapeutic effect in leukæmia, we have explored for such activity a number of 2 : 4-diaminopteridines[3,4,5] already known to be antagonists of pteroylglutamic acid[6], with the view of their possible clinical use.

Tests were carried out in a basal medium differing from that used by Barton-Wright *et al.*[7] in the use of 10 gm. sodium acetate, 6 gm. acid-hydrolysed casein, 200 µgm. riboflavin, 500 µgm. calcium pantothenate, 0·4 µgm. biotin, 100 µgm. aneurin, and 60 mgm. l-tryptophan per 500 ml. Diaminopteridines, named in the table, were diluted serially by two in tubes containing this double-strength medium, autoclaved, and the medium brought to single strength by sterile glass-distilled water containing appropriate levels of synthetic folinic acid (5-formyl-5 : 6 : 7 : 8-tetrahydropteroylglutamic acid). After sowing with a standardized inoculum of washed cells of *Leuconostoc citrovorum* (N.C.T.C. 7837), the tubes were incubated at 37° C. for 65 hr., when the acid produced was titrated with $N/10$ sodium hydroxide.

From these titrations we obtained the concentration of diaminopteridine required to inhibit acid production by 50 per cent, from which an inhibition factor was calculated as the ratio of molar concentrations of diaminopteridine to folinic acid in the medium. The geometric means of the inhibition factors obtained in two or more separate experiments (at each level of folinic acid) are expressed in the table.

* Inhibition factor = ratio of molar concentrations of diaminopteridine to folinic acid to inhibit acid production by 50 per cent.

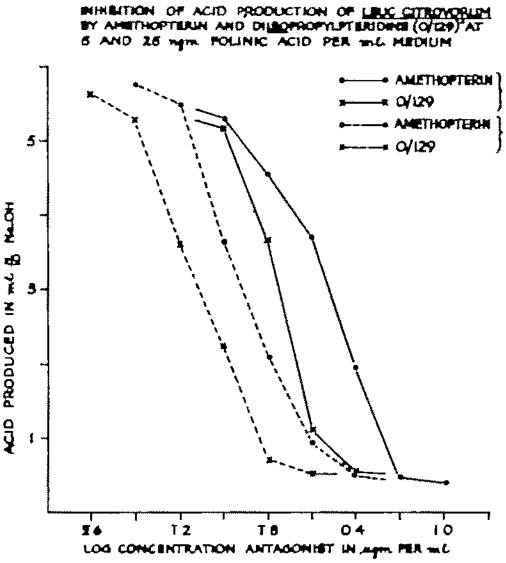

Fig. 1

It will be seen that at the levels of 1, 5 and 25 ngm. of folinic acid per ml., the inhibition factor of di*iso*propylpteridine was constant. This indicates a competitive inhibition of the type first described by Woods[8] for sulphanilamide against *para*-aminobenzoic acid. The inhibition ceases to be competitive and becomes irreversible by folinic acid when higher concentrations of the di*iso*propylpteridine are used.

In the present group of compounds, potency as folinic acid antagonists closely depends on structural details in the 6 and 7 positions of the pteridine ring. In the dialkyl series, peak activity was seen at the di*sec*.butyl-(0/142) and di*iso*propyl-(0/129) pteridines and in the indole series at the N-*n*-propyl (0/168). Activity was slight in the dimethylpteridine (0/58) and and in the diphenyl (0/63): it was not detected at al in unsubstituted diaminopteridine (0/154). The las three compounds, which were first synthesized by Mallette, Taylor and Cain[9], were found by Burchena *et al.*[1] to be inactive against mouse leukæmia. Albert Brown and Cheeseman[10] have prepared 2-amino 6 : 7-diethylpteridine and the corresponding 4-amino compound. We have found that the inhibition factor of these two monoaminopteridines at 5 ngm. folinic acid per ml. exceeded 60,000, while that of 2 : 4 diamino-6 : 7-diethylpteridine (0/69) was about 2,000 This indicates that the omission of one amino-grou from the type of compound under investigatio reduces antifolinic acid activity.

Since it has been reported that certain anti malarials, such as pyrimethamine[11] and 4 : 6-diamino 1-(*p*-chlorphenyl) - 1 : 2-dihydro-2 : 2-dimethyl-*s*-tri azine[12], possess antifolinic acid activity, it is no surprising that many of the pteridines here discusse are also potent antimalarials. In the present serie however, there does not appear to be any correlatio between antifolinic acid activity, evaluated wit *Leuconostoc citrovorum*, and ability to suppres *Plasmodium berghei* infections of mice. For example di*cyclo*hexylmethyl-(0/104), di-*n*-butyl-(0/128) an di*iso*propyl-(0/129) pteridines are roughly equal i antimalarial activity[13], although they differ widely a folinic acid antagonists.

It will be seen from the table that there is littl difference between the inhibition factors of th i*sec*.butyl- and di*iso*propyl-pteridines and of ametho-terin at the level of 5 ngm. folinic acid per ml. A comparison of the activities of 0/129 and ametho-terin at two levels of folinic acid is illustrated in ig. 1.

We wish to thank Miss M. Boothroyd and Mrs. . Harris for technical assistance, the American yanamid Company for supplies of synthetic folinic acid ('Leucovorin') and of amethopterin and amino-terin, Prof. A. Albert for the mono-amino-pteridines, nd the directors of Allen and Hanburys, Ltd., for ermission to publish this communication.

A Chromatographic Method for the Estimation of Oleic and Linoleic Acids in the Presence of Straight-chain Saturated Fatty Acids

Two communications have recently appeared in *ature* on the chromatographic separation of naturally occurring fatty acids or their esters. Nijkamp[1] uses a silica gel column for the separation of C_{10} to C_{18} saturated acids. Cropper and Heywood[2] have volved a rapid vapour-phase technique for the eparation of the methyl esters of saturated acids which they state will be investigated for use in the eparation of linolenic, linoleic and oleic acids. In the course of investigations on the biochemical changes occurring during ripening of oil palm fruits, nd during germination of oil palm and water melon seeds, we have developed a chromatographic method or estimating oleic and linoleic acids in the presence f saturated straight-chain acids from C_8 to C_{20}. his is based on the reversed-phase chromatographic rocedure of Howard and Martin[3], later modified by opják and Tietz[4] for the analysis of saturated acids rom C_{10} to C_{18}, and by Silk and Hahn[5] for similar acids from C_{16} to C_{24}. Acetone–water mixtures varying rom 45 per cent acetone (C_{10}) to 90 per cent acetone (C_{24}) have been recommended as eluting agents, the acids being estimated by titration with 0·01 *N* alcoholic potassium hydroxide to a bromthymol blue nd-point.

Standard titrations on pure acids, without passage through the column, show that recoveries are influenced by the concentration of non-aqueous solvent. These titration curves indicate that the green end-point (*p*H 6·8–7·0 in aqueous solution) usually recommended gives incomplete neutralization for the longer-chain acids, and we have therefore adopted a blue-green end-point (*p*H 7·4 in aqueous solution). Results, after correction for reagent blank, then range from 99·2 per cent (caproic acid in 35 per cent acetone) to 95·4 per cent (stearic acid in 75 per cent acetone). Recoveries from the column agree well with these figures, indicating no significant loss by retention on the column. The amount of total fatty acid used varied from 2 to 50 mgm.

Using a 1·3 cm. × 30 cm. column, linoleic and oleic acids can be separated satisfactorily from one another but not from the saturated acids. Although linoleic is eluted slightly more slowly than myristic acid, mixtures of the two (in any proportions) form a single peak: oleic has the same R_F value as palmitic acid. Figures can therefore be obtained for the total quantities of (i) myristic + linoleic acids, and (ii) palmitic + oleic acids.

Various methods were considered for the separation of these saturated and unsaturated acids. The standard lead salt method is unsatisfactory in the presence of myristic acid. Chromatographic separation of the unsaturated acids as the 2.4-dinitrobenzenesulphenyl chloride derivatives[6] proved difficult and was rejected. The final method adopted was a Bertram[7] (alkaline permanganate) oxidation to destroy the unsaturated acids, followed by estimation of the remaining saturated acids by chromatography. Experiments with pure oleic and linoleic acids indicated complete loss of the original acid peaks after oxidation at room temperature for 16–18 hr. Both acids were converted into products which were either not extracted by light petrol (b.p. 40°–60°) at the end of the Bertram oxidation or which had a high R_F value and could be separated completely from the C_{12} or longer-chain saturated acids. After oxidation under these conditions, palmitic acid can be recovered in 95–98 per cent yield, and myristic acid in 90–96 per cent yield. The results for the analyses of different mixtures can be seen from Table 1. Amounts used in the oxidation varied from 15 to 100 mgm. of total fatty acid; an aliquot of this containing 8–25 mgm. was then chromatographed. Further details of this method will be published elsewhere. We are extending it to the analysis of other unsaturated acids.

* Calculated from iodine value (Woburn), and checked by ultraviolet spectrophotometric method (ref. 8).

In this brief communication it is impossible to acknowledge all the help we have received from various sources; but we should like to express our indebtedness to Prof. W. T. Williams for his encouragement, and to Prof. N. K. Adam for a gift of pure fatty acids.

Since submitting the above, our attention has been directed to a paper by Savary and Desnuelle[9], who employ a slightly different oxidation procedure for the estimation of oleic and linoleic acids in simpler mixtures. It is hoped to examine this method more fully in a later communication.

Effect of Cortisone on the Neonatal Rat

NEONATAL rats have been treated with cortisone acetate (Merck ; Roussel) in doses of 0·25–5 mgm./day subcutaneously, control litter mates being given the same dosage of suspending medium. The experiments were undertaken primarily to test the effect upon microglial immigration and transformation in the brain. Hortega's neonatal 'fountains' were found to be completely suppressed within 24–36 hr. of a single dose of 2·5 mgm. of cortisone, and in older animals myelination was retarded.

The treated animals showed a striking failure to grow, or in some cases a retarded growth followed by loss of body weight ending in death (Fig. 1). Such animals presented all the signs of pituitary failure (Fig. 2). They were small and shrivelled, with very little subcutaneous fat and a marked failure of hair growth. Without exception they showed a considerable degree of exophthalmos. In some cases their eyes actually opened before those of the control litter mates. Their appearance corresponded with that produced in chick embryos by Karnofsky *et al.*[1] by cortisone treatment. There was a general decrease in lymphoid tissue, and pituitaries were small an degenerate on histological examination. A detaile account of these changes will be published elsewhere

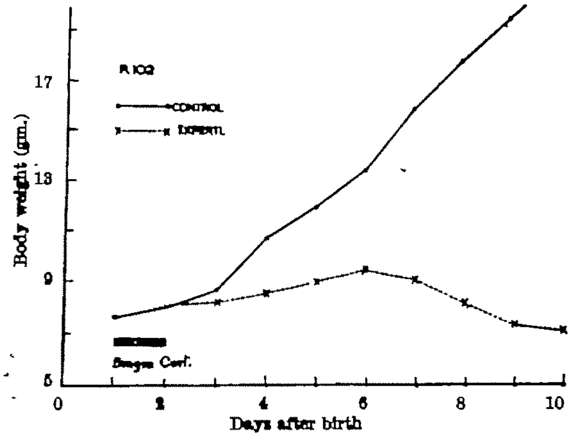

Fig. 1

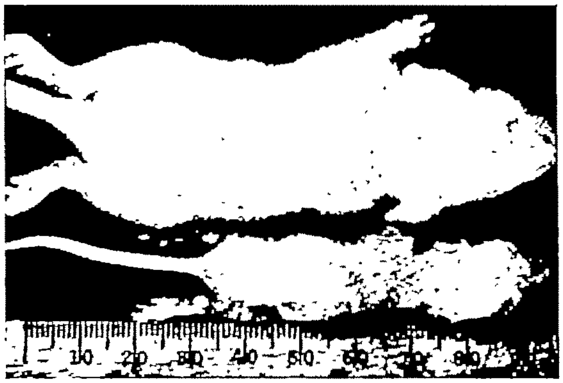

Fig. 2

Cortisone is known to depress adrenocorticotrophi activity of the anterior lobe of the pituitary gland[2] It is also known to inhibit growth of the embry chick after the eighth to tenth day of incubation[1] On the other hand, it has been held not to diminis thyrotrophic secretion of the adenohypophysis bu possibly, indeed, to increase it[3].

Exophthalmos has been produced in adult rats b prolonged exhibition of cortisone[4]. Such treatmen may produce thyroid depression—"corticogenic hypothyroidism"—so that the exophthalmos might b attributable to thyrotrophic activity of the pituitary since the thyrotrophic hormone is known to b capable of producing the condition in rats[5]. Aterma and Greenberg[4], however, are inclined to attribut the exophthalmos produced by cortisone in the ra to a direct alteration of the physico-chemical stat of the tissues within the orbit, and there is then n necessity for assuming a stimulating effect of cortison on thyrotrophic activity of the adenohypophysis i the present experiments.

Two points may be considered: (1) the simultaneous 'damping down' by cortisone of adrenotrophi activity and growth hormone of the anterior pituitar invites the speculation that the two principles may under physiological conditions, be part of an articulated complex at the time of their elaboration[6] (2) there may be a possibility of utilizing 'functionall hypophysectomized' neonatal rats as test anima for adrenocorticotrophic hormone activity—a modification of the method of Sayers, Sayers and Woodbury[7].

I wish to thank Dr. Max Reiss for helpful discussio of results. The cortisone used was supplied by th Medical Research Council, and the work was carrie out while in receipt of financial aid from th Council.

Role of High-molecular Weight Components in the Respiratory Activity of Cell-free Extracts of *Aerobacter aerogenes*

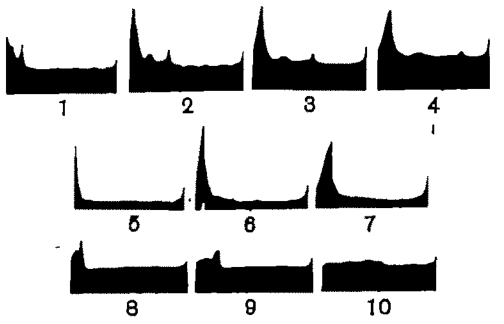
It has been shown that clear cell-free extracts from strain of *Aerobacter aerogenes* catalyse the oxidation of glucose, glucose-6-phosphate, hexose diphosphate, pyruvate and succinate[1]. As the rate of oxidation with these substrates was not appreciably modified by 20-min. centrifugation in a field of 15,000 *g*, and as the extract was transparent by transmitted light, it was obvious that the enzyme systems concerned were attached to very small elements.

The experiments reported here show that the bulk of the succinic oxidase system, in these cell-free extracts, is bound to one, or possibly two, high-molecular weight components, which have sedimentation constants of approximately 40 and 22 *S* respectively. The same components are also necessary, in addition to soluble factors, for the oxidation of glucose, pyruvate, citrate, α-ketoglutarate and fumarate.

The strain of *Aerobacter aerogenes* used and the methods of cultivation have been described previously[1]. The bacteria from a 24-hr. culture were washed three times with twenty volumes of distilled water by centrifugation and the well-packed cells were ground by hand in a cold mortar for 2–3 min. with three parts (w/w) of a very fine 'Pyrex' glass powder (passed through a 200-mesh sieve) and extracted with 2·5 parts (w/v) of ice-cold distilled water. A first centrifugation at 4,000 *g* for 20 min. removed the glass powder, the intact cells and the larger cell debris, and the supernatant was centrifuged again at 18,000 *g* for 20 min., to give a clear supernatant (Sup. 1). This fraction was again centrifuged for 90 min. at about 110,000 *g* in a model *L* Spinco centrifuge, yielding a supernatant (Sup. 2) and a small gelatinous pellet which was resuspended in one-fifth the volume of Sup. 1 of 0·05 *M* phosphate buffer *p*H 7·0 to give fraction *P*. The preparation was kept at 0–4° C. throughout these manipulations.

The various fractions Sup. 1, Sup. 2 and *P* were examined in the ultracentrifuge. As seen in Figs. 1–4, three major components were found in Sup. 1, with sedimentation constants of about 40, 22 and 9 *S* respectively. In Sup. 2 (Figs. 5–7) only the third component (9 *S*) was present, while fraction *P* contained the two larger components only (40 and 22 *S*, Figs. 8–10). Thus, by centrifugation at about 110,000 *g* for 90 min., it was possible to separate the two larger components from the rest of the extract. Of these two components, that of 40 *S* was the major one; it showed a sharp boundary in the ultracentrifuge, and its molecular weight, based on ultracentrifugal data, is of the order of 1–3 millions. Further experiments are required to determine accurately the molecular weights and to study the homogeneity of both the 40 and 22 *S* components.

Schachman, Pardee and Stanier[2] found that cell-free extracts prepared by different methods and from different species of bacteria all gave essentially similar patterns on examination in the ultracentrifuge. The extracts contained four major components with sedimentation constants of about 40, 20–30, 9 and 5 *S*. An electron micrograph of the purified 40 *S* fraction showed that it was formed of particles which appeared to be spherical with a diameter of about 150 A., and the molecular weight of these elements, calculated either from ultracentrifugal or electron microscopic data, was about one million. Although they did not give any data on the matter, Schachman *et al.*[2] stated that the 40 *S* fraction contained "considerable amounts of ribonuclease, catalase, apyrase, formic dehydrogenase and succinodehydrogenase". Siegel, Singer and Wildman[3], in the course of their study of high-molecular weight components of normal and infected *E. coli* cells, observed very similar ultracentrifugal patterns, and the data presented here are in good agreement with those given by both groups of authors.



Ultracentrifugal patterns of Sup. 1 (1–4, time interval 600 sec., average speed 38,400 r.p.m. increased after picture 3 to 43,100 r.p.m.); Sup. 2 (5–7, time interval 840 sec., average speed 43,000 r.p.m.); and *P* (8–10, time interval 800 sec. between 8 and 9, and 900 sec. between 9 and 10, average speed 39,600 r.p.m.)

The ability of Sup. 1, Sup. 2 and *P* to oxidize various substrates was tested in Barcroft differential manometers at 36° C., in the presence of 0·05 *M* phosphate buffer *p*H 7·0 and with potassium hydroxide in the centre well. 1·5 ml. of either Sup. 1 or Sup. 2 and 0·3 ml. of *P* were used in each manometric flask in a total volume of 3 ml. The results, presented in Table 1, show that Sup. 1 contained the catalysts necessary for the oxidation of glucose, pyruvate, citrate, α-ketoglutarate, fumarate and succinate. Sup. 2 alone was inactive in the oxidation of these substrates, while *P* contained the bulk of the succinic oxidase system present in Sup. 1. Further fractionation of *P* will show whether the 40 *S* component alone carries all the enzymes of the succinic oxidase system. Whatever the answer, however, the experiments reported here show that the very fine particles—or macromolecules—of fraction *P*, of which the largest have a molecular weight of the order of 1–3 millions, support a complete succinic oxidase system, and, with the soluble factors found in Sup. 1, are able to catalyse the oxidation of some intermediates of the citric acid cycle.

It has been known for some time that clear cell-free extracts from some bacterial species are able to catalyse the oxidation of various substrates, including Krebs-cycle intermediates. Thus Stone and Wilson[4]

Table 1. OXIDATION OF VARIOUS SUBSTRATES BY FRACTIONS FROM CLEAR CELL-FREE EXTRACTS OF *Aerobacter aerogenes*.

Results given as Q_{O_2} (μl. oxygen uptake/mgm. protein/hr.) corrected for blanks. Substrate concentration: 0·03 *M*. Experimental conditions: see text

	Sup. 1	Sup. 2	*P*
Glucose (with 0·04 m.mol. diphosphopyridine nucleotide	49	4	0
Pyruvate (with 0·04 m.mol. diphosphopyridine nucleotide and 36 units of coenzyme A)	16	1	0
Pyruvate (with 0·04 m.mol. diphosphopyridine nucleotide, no coenzyme A)	10	1	0
Citrate	5·5	0	0
α-Ketoglutarate	6	0·7	0
Fumarate	8	0	0
Succinate	8	0	42

presented evidence that in an extract from *Azotobacter* the citric acid cycle was operating. As this extract was said to be translucent, and in view of the results of Schachman *et al.*[2] with different species of bacteria, it is not unlikely that the largest particles were of the same order of magnitude as those found in Sup. 1.

It is of great interest that some of the reactions, which in animal tissues are known to depend upon the integrity of the mitochondria, can take place in a bacterial extract in which the largest element would have a diameter of about 150 A., and therefore a volume of nearly one-millionth that of a mitochondrion.

However, as the activity of these bacterial extracts in the oxidation of some of the citric acid cycle intermediates is low compared with that of mitochondria, it is not inconceivable that when the cells are disrupted a cellular organization, necessary for optimum activity of the enzyme systems concerned, is disturbed.

I am indebted to Dr. P. Johnson for carrying out the experiments in the analytical ultracentrifuge and to Miss J. Moyle for her assistance in running the preparative Spinco centrifuge.

Effects of Intraventricular Administration of Substance P

The presence of substance P in the central nervous system was first shown by Euler and Gaddum[1]. According to recent work on the distribution of this substance in the brain[2,3], the largest amounts are found in the basal ganglia, the hypothalamus, the midbrain and the grey matter of the spinal cord. Nothing is known about the action and function of substance P in the nervous system. We have now observed tachypnœa and hyperpnœa produced by substance P injected into the third ventricle of the rabbit and the cat.

Substance P was prepared and purified by the method of Euler[4] and Pernow[3]. Cow intestine was cut into pieces, boiled in water at *p*H 4 and the filtrate concentrated and precipitated with ammonium sulphate at 70 per cent saturation. The precipitate was purified by adsorption on aluminium oxide and elution with methanol. The activity of the preparation, tested on isolated guinea pig ileum, was 100–150 units per mgm. Substance P was dissolved in Ringer's solution. The volume injected varied between 0·05 and 0·2 ml. A preparation of substance P inactivated with crystalline chymotrypsin was used as a control solution.

The animals were anæsthetized with urethane (rabbit) and 'Nembutal' (cat). Substance P was injected through a cannula inserted in the intersection of the coronal and sagittal sutures at right angles to the vertex of the skull. The position of the tip of the cannula in the third ventricle was checked after each experiment by injection of aniline blue. Respiration was measured quantitatively by using a body-plethysmograph.

Intraventricular injection of 5 units of substance P produced, after a latent period of about five minutes, a successively increased rate of respiration of 30–50 per cent with a maximal effect occurring after 10–15 min. With 20 units the effect was even more pronounced. There was also an increase in the amplitude of the respiratory movements. Usually the injections produced a slight, gradual rise in the blood pressure of about 10 mm. mercury. These effects lasted from 20 min. to more than two hours. A pronounced tachypnœa and increased respiratory amplitude were also observed in unanæsthetized rabbits after injection of 10 units of substance P. No effect was obtained with control injections o Ringer's solution or inactive solutions of substance P.

When injections were made into paraventricular tissue and the solution did not enter the ventricular system, no consistent or lasting effects upon the respiration were recorded.

Recently, the effects of intraventricular injections of different drugs have been studied by Feldberg and Sherwood[5]. Tachypnœa was observed after injections of histamine, 5-hydroxytryptamine, adenosine triphosphate, hexamethonium, *d*-tubocurarine and atropine.

Development of Tolerance to Ganglion Blockade by Methonium Compounds

The clinical observation that tolerance follows the repeated administration of hexamethonium salts was reported by Smirk and others[1]; and Smirk[2] has reported that the tolerance to hexamethonium salts was effective also in reducing the effects of other methonium salts. No reports concerning similar phenomena in animals have been found, and I have not found published observations as to the mechanism whereby tolerance occurs. This preliminary report is concerned with the mechanism by which tolerance is developed to the ganglion-blocking action o methonium salts.

Studies of the mydriatic effect of these agents in mice, and of blockade of the superior cervical sympathetic ganglia in the cat, indicate that tolerance o the ganglia to the effects of these substances follows their repeated administration to the whole animal. The local application of methonium compounds to isolated autonomic ganglia, however, did not give rise to any tolerance; but similar isolated preparations taken from animals which had previously been made tolerant by repeated doses of methonium salts were found to have become almost insensitive to these substances. The application of blood from tolerant animals and patients was found to confer tolerance on isolated ganglia from non-tolerant animals.

The superior cervical ganglia of bilaterally nephrectomized cats recovered from the effect of a intravenous injection of hexamethonium, although the recovery was slower than in normal animals. In nephrectomized cats, tolerance occurred as rapidly as in normal animals. By contrast, the ganglia of eviscerated or dehepatized cats did not develop tolerance after an intravenous injection of hexamethonium; but, when by a cross-circulation experiment the isolated liver of another animal was incorporated into the circulation, tolerance developed as in the whole animal.

Solutions of hexamethonium were assayed for this substance biologically and by a modified bromphenol blue method[3] before and after perfusion through an isolated liver, and before and after the solution was incubated with liver homogenates. The concentration of hexamethonium was rapidly reduced until none could be detected. The solution of hexamethonium treated with liver homogenate, when applied to isolated ganglion, produced resistance to the effects of further hexamethonium. It was concluded that the action of the liver on hexamethonium gave rise to a substance which competed with hexamethonium at the ganglion without itself producing any important degree of ganglionic block.

Studies on the nature of the liver principle which inactivated hexamethonium suggested that it is an enzyme, in that alterations in pH, temperature and the action of certain chemical substances reduced its activity and it is completely inactivated by trypsin digestion. The principle has been isolated in comparatively pure form, and is very active in destroying hexamethonium.

Estimations carried out on the excretion of hexamethonium have suggested that about 60 per cent of a parenteral dose is excreted in the urine. Evidence is available suggesting that the remainder is metabolized, presumably in the liver.

The work has given information which throws light on the mechanism of the development of toleration to the ganglion-blocking action of methonium compounds, and may throw light on the mode of the production of the ganglionic-blocking effects of these agents.

Papers embodying the results of this investigation will be published elsewhere.

Galactopoietic Action of Thyroxine in Cattle kept in Subtropical Countries

A perusal of the available literature shows that no systematic work has been so far carried out to study the effects of the oral administration of thyroxine on the daily milk yield of different indigenous breeds of buffaloes and cows, bred in subtropical countries such as western Pakistan[1]. Two preliminary experiments were carried out to study the effects of the daily feeding of thyroxine in suitable doses, for a period of four weeks, on the daily milk yield in a six-year old Murrah buffalo and a five-year old Shaiwal cow kept in Lahore during October–November 1953.

The experimental animals (two buffaloes and two cows) were selected in such a way that the age of the animals, number and stage of lactation and the milk yield of the experimental animals were very close to that of the controls. The experiments were started about eight and twenty weeks after calving in the buffaloes and cows respectively. The animals were given orally 15 gm. of thyroprotein (containing 0·75 per cent *l*-thyroxine on bioassay) per animal. Thyroprotein under the registered name of 'Protamone' was kindly supplied by Cerophyl Laboratories, Kansas City, U.S.A. This preparation was adopted because it affords a ready means of administration of thyroxine by farm workers. The animals were milked twice a day and the daily milk yield of each animal was recorded. As the body temperature gives some indication of the physiological state of the animal body, the rectal temperatures of the animals were recorded daily. The mean minimum and maximum atmospheric temperatures for the months of October and November were 63·0° and 93·9° and 50·0° and 82·0° F. respectively, and the mean relative humidities were 56 and 69 per cent.

During the four-week period, the daily yields of the control and treated buffaloes were 22·7 ± 0·027 and 27·1 ± 0·018 lb. respectively. Statistical analysis of the results showed that thyroxine therapy resulted in a highly significant increase in the daily milk yield of the experimental buffalo ($t = 16·815$). The average daily milk yields of the control and experimental cows were 12·0 ± 0·11 and 13·7 ± 0·24 lb. and the increase was not significant.

The mean daily temperatures of the experimental animals, when compared with those of their respective controls, did not show any significant difference throughout the experimental period, indicating that the administration of thyroxine did not affect the animal body adversely.

There are some indications that an optimal increase in the daily milk yield of the lactating animals can only be obtained if thyroxine therapy is started at an early stage of lactation.

This work is being continued.

Occurrence of *trans*-Acids in Animal Fats

Bertram's discovery[1] that ox and sheep fats, and butterfat, contain traces of *trans*-Δ^{11} octadecenoic (vaccenic) acid has been confirmed by other investigators[2,3], who have shown that this acid also occurs in traces in lard.

Using infra-red absorption technique, Swern *et al.*[4] recently found that beef fat contained not traces, but 5–10 per cent of *trans*-acids. These consisted of a mixture of Δ^{9} and Δ^{11} octadecenoic acids. By a similar procedure Cornwell *et al.*[5] found 5·0–9·7 per cent of *trans*-acids in butterfat. In the present work, undertaken to elucidate the origin of these *trans*-acids, we have estimated by infra-red absorption their content in the body fats of various animal species.

The table shows a marked difference in the *trans*-acid content of ruminants as compared with non-ruminants. The small amounts of *trans*-acids in pig fat could be derived from the skim-milk diet, as

Trans-UNSATURATED-ACID CONTENT OF ANIMAL DEPOT FATS

Species	Diet	Fat	Percentage *trans*-acid
Non-ruminants			
Rat	High carbohydrate 'fat-free'	Total body-fat	Not detected
Horse	Pasture	External and internal fatty tissues	Not detected
Pig	Skim-milk	Perinephric	0·9
Rabbit	Pasture	Abdominal cavity	Not detected
Ruminants			
Ox	Pasture	Beef tallow	4·5
Sheep	Pasture	Mutton tallow	11·2
Deer	Pasture	Perinephric	3·5

butterfat contains *trans*-acids, and it has been previously shown by Sinclair[6] that *trans*-acids (elaidic acid) when present in the diet are deposited in the depot fat.

Swern *et al.*[4] suggested that the *trans*-acids present in depot fat may have been produced endogenously from a *cis* monoethenoid (oleic) acid by oxidases. If this were so, then from the *trans*-acid contents of the fats shown in the table one could infer that such oxidases are present in ruminants, but not in non-ruminants. However, oxidases have been found in the tissues of rats, pigs and rabbits[7]. We consider, therefore, that the presence of *trans*-acids in ruminant depot fats could be better explained on the basis of bacterial action in the rumen.

We have found about 9 per cent of *trans*-acids in the fatty acids isolated from the rumen contents of pasture-fed sheep. (The rumen contents of living sheep were obtained through the courtesy of Dr. A. T. Johns, of the Department of Scientific and Industrial Research, Grasslands Division, Palmerston North, New Zealand.) No appreciable amounts of *trans*-acids were found in pasture lipids.

The mechanism of *trans*-acid formation in the rumen can be deduced from the work of Reiser[8], who showed that rumen bacteria hydrogenate linolenic acid to linoleic acid. Hydrogenation of unsaturated acids is accompanied by partial formation of *trans*-isomers, and this could explain the presence of *trans*-acids in the rumen.

This work is in progress, and the detailed results will be published elsewhere. In the meanwhile, the results now recorded serve to accentuate even more sharply the wide differences between the fat metabolism of ruminants and of non-ruminants, already referred to by one of us[9].

Relation of Nitrogen Supply to the Molybdenum Requirement of Tomato Plants grown in Sand Culture

AGARWALA[1] has shown that molybdenum deficiency decreased the growth and ascorbic acid content of cauliflowers grown in sand culture, irrespective of whether nitrogen was given as nitrate, or as nitrite, ammonium compounds or urea. Except with nitrite, molybdenum deficiency also induced symptoms of whiptail[2] which serve as criteria for the diagnosis of molybdenum deficiency. In later work[3], molybdenum deficiency induced whiptail also in plants given nitrite or glutamic acid. As the whiptail condition is apparently confined to brassica crops[2,4] and might indicate a special role for molybdenum for this genus, it was desirable to investigate the relation of molybdenum requirement to nitrogen source in some other plant where symptoms of molybdenum deficiency are of a different type. Tomato was chosen as it is a sensitive and well-known indicator for molybdenum deficiency[4].

Plants were grown in sand culture by methods already described[3]. Purified calcium carbonate was mixed in the sand to prevent injury by ammonia, and all nutrient salts including the different nitrogen compounds were purified by treatment with copper sulphate and hydrogen sulphide. Nitrogen sources were: nitrate, nitrite, ammonium sulphate, ammonium nitrate, ammonium nitrite, urea or glutamic acid.

Growth was markedly reduced by omission of molybdenum irrespective of nitrogen source ($p < 0{\cdot}001$ for all treatments, except ammonium sulphate $p < 0{\cdot}05$). The percentage dry matter in leaves was also reduced with most nitrogen sources ($p < 0{\cdot}05$–$0{\cdot}001$) but was quite unaffected by molybdenum supply in the presence of urea or glutamic acid. Ascorbic acid[5] and dehydroascorbic acid were both similarly decreased by molybdenum deficiency irrespective of nitrogen source, but to differing degrees of significance as follows: nitrate, ammonium nitrate ($p < 0{\cdot}001$); ammonium sulphate, ammonium nitrite ($p < 0{\cdot}01$); glutamic acid ($p < 0{\cdot}05$); urea, nitrite ($p > 0{\cdot}05$). The ratio of ascorbic to dehydroascorbic acids was remarkably constant, remaining about 1 : 1·1 irrespective of treatments.

Total chlorophyll content was markedly decreased by molybdenum deficiency *only* in the nitrate or ammonium nitrate treatments ($p < 0{\cdot}001$). There were slight decreases or increases in most other treatments, but with ammonium sulphate there was a notable increase with omission of molybdenum ($p < 0{\cdot}01$).

In all sets of data there was a marked difference between the magnitude of the molybdenum effects in the presence of nitrate or ammonium nitrate and those produced with the other nitrogen sources. In each instance the nitrogen to molybdenum interaction was highly significant ($p < 0{\cdot}001$), except dehydroascorbic acid ($p < 0{\cdot}01$).

Thus, although evident generally in all treatments, the molybdenum effect and possibly its requirement are significantly less with non-nitrate sources of nitrogen than in the presence of nitrate. It is concluded at present that chlorophyll production is independent of molybdenum supply unless nitrate is present.

The visual symptoms observed in this experiment merit special note. Severe symptoms typical of nolybdenum deficiency[4] were clearly recognizable *nly* in the nitrate and ammonium nitrate treatments. 'hey were similar in both except for a somewhat arker colour of the green areas in the latter treatment. In the other treatments plants were practically ymptomless and normal in appearance though maller, except for occasional sporadic incidence of ither dark brown marginal areas in old leaves (mainly vith glutamic acid), or sudden wilting and withering vithout loss of chlorophyll in apical leaflets of mid-stem leaves (mainly with urea or nitrite). These ymptoms were relatively slight in extent and were onfined to plants given non-nitrate sources of itrogen and no extra molybdenum.

The evidence presented here supports the conclusion that molybdenum is essential for tomato, rrespective of whether nitrogen is given as nitrate r in a number of other forms at different stages of eduction, but that relative requirements depend on he nitrogen source. Full details and results of work ow in progress will be reported elsewhere.

Copper Sulphate as an Aquatic Herbicide

DURING the course of an experiment in the use of opper sulphate against bilharzia snail hosts in the eason 1951–52, it was noted that the water-weed egetation appeared to be affected by the treatment.

Two canals, branching off the general Gezira rigation system at the same point, were hand-eeded in July 1951 and treated with 30 parts per illion of crystalline commercial copper sulphate for nail control. Three canvas bags containing copper lphate crystals were then hung in the flowing water st below the head regulator of the first canal, and filled as required. The second canal received no rther treatment. It is estimated that throughout e watering season, all water entering the first canal as treated at an average rate of 1 part per million ith copper sulphate. By March 1952, towards the d of the watering season, it was apparent that ere were large differences in both weed and snail pulations in the two canals under experiment, and survey carried out at that time showed that though e second canal had a heavy population of both ails and pondweed species, neither weeds nor snails ere to be found in the first, throughout the whole ¼ km. of its length.

During the period April–July 1952 a certain re-owth of weed occurred, no doubt owing to the terrupted flow of water (for domestic purposes ly) during this 'closed' period. In July 1952, with e resumption of watering for the new crop, the plication point of the copper sulphate was removed km. upstream so as to command a small branched stem including the two canals of the previous ear's experiment. This was all, except the 'second' nal referred to, treated again with 30 p.p.m. of copper sulphate, and then continuously with an amount afterwards estimated at 2 p.p.m. No weeding was carried out until March 1953, when an examination revealed that (1) no weeds grew nearer than 3 km. downstream of the point of application; (2) only patches of *Potamogeton nodosus* appeared able to grow within 10 km. of the point of application, though (3) at points below this some *Najas pectinata* and a little *Chara globularis* were found; (4) no bilharzia snails were found; (5) at no time were watering difficulties encountered on account of weed growth.

Further experiments are being carried out by the Sudan Ministry of Irrigation in order to ascertain if modifications of this method are practicable as a weed control treatment.

Culture of Insect Tissues

GOODCHILD[1] has recently described attempts to culture *in vitro* the tissues of *Rhodnius prolixus*, and suggested two possibilities that might enable the successful establishment of cultures. The two suggestions are (1) to replace glass surfaces by mica, or cover them with a film of wax, and (2) to enrich the culture medium with an extract of *R. prolixus* embryos. Similar suggestions were included in a series of experiments that I have recently performed. Cultures capable of growth and of yielding subcultures have not so far been established, and it appears that the problems of insect tissue culture are more complex than has hitherto been appreciated.

Attempts have been made to culture the following tissues: hæmocytes (from cetoniid larvæ), *Bombyx mori* L. pupæ, and from *Periplaneta americana* L. nymphs and adults; gonads from *B. mori* pupæ; embryonic cells from eggs of *Drosophila melanogaster* Meig. two hours old; imaginal disks (eye, leg, wing, antenna) of *D. melanogaster*; epidermal cells of cetoniid larvæ; fore and midgut of *P. americana*.

The following media were used: (1) *B. mori* pupal blood, (2) aqueous extracts of *Drosophila* pupal and adult tissues, (3) Trager's[2] medium, (4) adult and embryonic insect tissue extracts in various combinations with vitamins, glutathione, cystine, cholesterol, concentrations of free amino-acids approaching those of insect blood[3], fowl plasma and chick embryo extract, (5) fowl plasma and chick embryo extract.

The following techniques were used: hanging drops of fluid; hanging drops with solid clots of fowl plasma and other ingredients; perforated 'Cellophane' sheets covered by liquid medium on cover slips; cover slips containing a drop of agar on which were placed drops of liquid medium. All the cultures were incubated at 25° C.

The antibiotics chloromycetin and sodium sulphadiazine were used in some media. They did not appear to have any effect on the tissues.

Survival of various tissues up to a week was observed, but continued growth was not obtained. In certain tissues, notably *Bombyx* hæmocytes, a syncytium was formed within 24 hr. of setting up the cultures and survived for six days. Long processes from fat-body cells were produced within 24 hr., resembling vertebrate fibroblast cultures, but no mitoses were observed in them and they did not increase in size during a six-day survival period.

The reasons for the difficulty in establishing insect tissue cultures are worthy of further investigation. I consider it unlikely that technical improvements in conventional methods such as Goodchild[1] has mentioned will be sufficient to establish insect tissue cultures. Further developments would appear to demand greater knowledge of hormone balance, tissue continuity and growth substances of insects.

Occurrence of Two East American Species of Crabs in European Waters

Recently, two species of crabs, widely distributed on the Atlantic coast of the United States of America, were found in Danish waters. Since there is a possibility that especially one of them may be living in Britain and elsewhere but has been overlooked, I report here some details of the recent and of previous finds of the two species.

(1) Blue crab or common edible crab, *Callinectes sapidus* Rathbun. On September 20, 1951, a live female of the blue crab was caught in a plaice net in the Sound north-east of Copenhagen. It was kept alive for almost a year and moulted one month after the capture, increasing its width from 141 to 177 mm.

There are a few previous records from Europe. In 1900 a male was taken in south-west France[1]. Den Hartog and Holthuis[2] give two certain records from Holland (River Zaan and Amsterdam), and in a letter Dr. L. B. Holthuis, Leyden, has informed me that in July 1951 a specimen (about 120 mm.) was caught by a fisherman in the Nordzeekanaal.
